places appear a variety of inscriptions. Near the catacombs there is an enormous reservoir, hewn out of this soft stone. The roof is supported by parallel rows of square pillars. Its dimensions are 150 feet by seventy-five, and thirty-five in depth. On a hill west of the town are the remains of the citadel, o. an oval form, surrounded by a well built wall, flanked by towers and a double ditch. The interior is full of ruined houses and columns. Long. 33° 55' E., lat. 36° 20' N.

SELENGA, a considerable river of Siberia, in the government of Irkoutsk, rising beyond the frontier, in the country of the Mongols, where it receives the Kharatala and the Iga. On approaching the frontiers it begins to be navigable, then flows from south-east to north-west, and falls by three mouths into the lake Baikal. The Russians have built several towns on its right bank, particularly Verschnei Oudinsk, Selinginsk, and Kiachta. A great quantity of a species of white fish, called omoudi, is taken in this river towards the end of August.

SELENITE is the term used by Dr. Thomson and other modern chemists for what was formerly called selenites. It is the same with gypsum.

SELENITES, in the old system of mineralogy, is the name of a large class of fossils, of which it is now unnecessary to describe the characters, since better arrangements and more accurate descriptions have been made. See MINERALOGY. Of the first order there were three genera; viz. 1. Leptodecarhombes, 2. Pachodecarhombes; 3. Tetrade-carhombes. Of the second there were also three genera:—1. Ischnambulces; 2. Isambulces; 3. Oxucie. Of the third one, inambulcia. Of the fourth also only one genus, the sandia. Of the fifth one, cathetolipes. Of the sixth order there were two genera; viz. 1. Lepastra; 2. Trichestra. Of the seventh one genus, symplexia.

SELENITES, in chemistry, called also gypsum spatous, a species of gypsum or plaster of Paris. See GYPSUM, and MINERALOGY.

SELENIUM, in chemistry, is a new elementary body, extracted by M. Berzelius from the pyrites of Fahlun, which, from its chemical properties, he places between sulphur and tellurium, though it has more properties in common with the former than with the latter substance. It was obtained in exceedingly small quantity from a large portion of pyrites. For the mode of extraction we must refer to his long and elaborate papers, translated from the *Annales d. Chimie et de Physique*, ix. et seq. into the *Annals of Philosophy*, for June, August, October, and December 1819, and January 1820.

When selenium, after being fused, becomes solid, its surface assumes a metallic brilliancy of very deep brown color, resembling polished hematites. Its fracture is conchoidal, vitreous, the color of lead, and perfectly metallic. The color of selenium, has a deep red color, but sticks together readily when pounded, and then assumes a gray color and a smooth surface, as happens to antimony and bismuth. In very thin plates selenium is transparent, with a ruby red color. When heated it softens; and at 212° it is semi-liquid, and melts completely at a tempe-

Vol. XX.

perature a few degrees higher. During its cooling it retains for a long time a soft and semi-fluid state. Like Spanish wax it may be kneaded between the fingers, and drawn out into long threads, which have a great deal of elasticity, and in which we easily perceive the transparency when they are flat and thin. These threads, viewed by transmitted light, are red; but, by reflected light, they are gray, and have the metallic lustre. When selenium is heated in a retort, it begins to boil at a temperature below that of a red heat. It assumes the form of a dark yellow vapor, which, however, is not so intense as that of the vapor of sulphur; but it is more intense than chlorine gas. The vapor condenses in the neck of the retort, and forms black drops, which unite into larger drops, as in the distillation of mercury.

If we heat selenium in the air, or in vessels so large that the vapor may be condensed by the cold air, a red smoke is formed, which has no particular smell, and which is condensed in the form of a cinnabar-red powder, yielding a species of flowers, as happens to sulphur in the same circumstances. The characteristic smell of horse-radish is not perceived till the heat becomes great enough to occasion oxidation.

Selenium is not a good conductor of heat. We can easily hold it between the fingers and melt it at the distance of one or two lines from the fingers without perceiving that it becomes hot. It is also a non-conductor of electricity. On the other hand M. Berzelius was not able to render it electric by friction. It is not hard; the knife scratches it easily. It is brittle like glass, and is easily reduced to powder. Its specific gravity is between 4.3 and 4.32.

The affinity of selenium for oxygen is not very great. If we heat it in the air, without touching it with a burning body, it is usually volatilised, without alteration; but if it is touched by flame its edges assume a fine sky-blue color, and it is volatilised with a strong smell of horse-radish. The odorous substance is a gaseous oxide of selenium, which, however, has not been obtained in an insulated state, but only mixed with atmospheric air. If we heat selenium in a close phial filled with common air, till the greatest part of it is evaporated, the air of the phial acquires the odor of oxide of selenium in a very high degree. If we wash the air with pure water, the liquid acquires the odor of the gas; but, as there are always formed traces of selenic acid, this water acquires the property of reddening litmus paper feebly, and of becoming muddy when mixed with sulphureted hydrogen gas. Selenic oxide gas is but very little soluble in water, and does not communicate any taste to it.

If we heat selenium in a large flask filled with oxygen gas, it evaporates without combustion, and the gas assumes the odor of selenic oxide, just as would have happened if the sublimation had taken place in common air; but, if we heat the selenium in a glass ball of an inch diameter, in which it has not room to volatilize and disperse, and if we allow a current of oxygen gas to pass through this ball, the selenium takes fire just when it begins to boil, and burns with a feeble flame, white towards the base, but green

or greenish-blue at the summit, or towards the upper edge. The oxygen gas is absorbed, and selenic acid is sublimed into the cold parts of the apparatus. The selenium is completely consumed without any residue. The excess of oxygen gas usually assumes the odor of selenic oxide. Selenic acid is in the form of very long four-sided needles. It seems to be most readily formed by the action of nitro-muriatic acid on selenium. The selenic acid does not melt with heat; but it diminishes a little in bulk at the hottest place, and then assumes the gaseous form. It absorbs a little moisture from the air, so that the crystals adhere to each other, but they do not deliquesce. It has a pure acid taste, which leaves a slightly burning sensation on the tongue. It is very soluble in cold water, and dissolves in almost every proportion in boiling water. M. Berzelius infers the composition of selenic acid, from several experiments, to be,

Selenium, 71·261 100·00 1 prime 4·96

Oxygen, 28·739 40·83 2 primes 2·00

If into a solution of selenic acid in muriatic acid we introduce a piece of zinc or of polished iron, the metal immediately assumes the color of copper, and the selenium is gradually precipitated in the form of red, or brown, or blackish flocks, according as the temperature is more or less elevated. When seleniate of potassa is heated with muriate of ammonia, selenium is obtained by the deoxidising property of the ammonia; but in this case we always lose a small quantity of selenium, which comes over with the water in the form of an acid. If we pour dilute muriatic acid on the compound of selenium and potassium dissolved in water, seleniureted hydrogen gas is evolved. Water impregnated with it precipitates all the metallic solutions, even those of iron and zinc, when they are neutral. Sulphur, phosphorus, the earths, and the metals, combine with selenium, forming seleniurets. Selenic acid neutralises the bases. Selenium has been recently found in two minerals; one is from Skrickerum, in the parish of Tryserum, in Smoland.

SELENOGRAPHY, *n. s.* Fr. *selenographie*; Gr. *σελήνη* and *γράφω*. A description of the moon.

Hevelius, in his accurate *selenography*, or description of the moon, hath well translated the known appellations of regions, seas, and mountains, unto the parts of that luminary. *Browne.*

SELEUCIA, in ancient geography, a city of Asia, surnamed Babylonia, because situated on its confines, at the confluence of the Euphrates and Tigris. Ptolemy places it in Mesopotamia. It is called also Seleucia ad Tigrim, by Polybius, Strabo, Isidorus, and Chancenus. It is watered on the south by the Euphrates, and east by the Tigris (Theophylactus), generally agreed to have been built or enlarged by Seleucus Nicator, by means of which Babylon came to be deserted. It is said to have been originally called Coche (Ammian, Eutropius), though others, as Arian, distinguish it, as a village, from Seleucia; and, according to Zosimus, the ancient name of Seleucia was Zochasia. It is now called Bagdad.

SELEUCIA was also the name of no fewer than eight other cities, all named from Seleucus Nicator, and situated in the kingdom of Syria, in Cilicia and near the Euphrates.—Flor. iii. 11.

Plut. Mela. i. 12. Strab. xi. 5. Plin. vi. 23. Lempr.

SELEUCIA ILBER, an ancient town of Syria on the sea coast, with a bishop's see; eight miles north of Antioch.

SELEUCIDÆ, a surname or patronymic of the Syro-Grecian monarchs of Syria, who reigned in that country from the death of Alexander the Great, till it was reduced to a Roman province; so named from Seleucus Nicator, the first of them. See SYRIA.

SELEUCIDÆ, ÆRA OF THE, in chronology, or the Syro-Macedonian era, is a computation of time commencing from the establishment of the Seleucidæ in Syria. This era we find expressed in the books of the Maccabees, and on a great number of Greek medals struck by the cities of Syria, &c. The rabbins call it the era of contracts, and the Arabs therick dilkarnain, that is, the 'era of the two horns.' According to the best accounts, the first year of this era falls in the year 311 B. C. being twelve years after Alexander's death.

SELEUCIS, or SELEUCENA, a division of Syria, so named from Seleucus Nicator. It was also called Tetrapolis, from its containing four cities: viz. Seleucia, so named from Seleucus; Antioch from his father; Laodocæa, after his mother; and Apamea, from his wife.—Strabo xvi.

SELEUCUS I., surnamed Nicator, or the conqueror, one of the chief generals under Alexander the Great, and, after his death, founder of the race of princes called Seleucidæ. He is equally celebrated as a renowned warrior, and as the father of his people; yet his virtues could not protect him from the fatal ambition of Ceraunus, one of his courtiers, by whom he was assassinated, A. C. 280. See SYRIA.

SELEUCUS was also the name of other five kings of Syria; distinguished by the surnames of Callinicus, Ceraunus, Philopater, &c. See SYRIA.

SELF, *pron.*, plur. selves, } Sax. *rylf*, *rylfa*;
SELFISH, *adj.* } Belg. *self*, *selve*.
SELFISHNESS, *n. s.* } Its primary signi-
SELFISHLY, *adv.* } fication seems to
SELF-SAME, *adj.* } be that of an ad-
jective. Very; particular; this above others; sometimes, one's own. Dr. Johnson's observations on the force of this word are so much in point that we must add them all.—It is united both to the personal pronouns, and to the neutral pronoun *it*, and is always added when they are used reciprocally, or return upon themselves: as, I did not hurt *him*, he hurt *himself*; the people hiss *me*, but I clap *myself*; thou lovest *thyself*, though the world scorns *thee*. It is sometimes used emphatically in the nominative case: as, *myself* will decide it; *I myself* will come; *himself* shall revenge it. This use of *self*; thus compounded, without the pronoun personal, is chiefly poetical. Compounded with *him*, a pronoun substantive, *self* is in appearance an adjective: joined to *my*, *thy*, *our*, *your*, pronoun adjectives, it seems a substantive. Even when compounded with *him* it is at last found to be a substantive, by its variation in the plural, contrary to the nature of English adjectives, as *him-*

self, themselves. Myself, himself, themselves, and the rest may, contrary to the analogy of *my, him, them*, be used as nominatives. It often adds only emphasis and force to the pronoun with which it is compounded: as, he did it *himself*. It signifies the individual, as subject to his own contemplation or action. It is much used in composition, which it is proper to explain by a train of examples. It is to be observed that its composition in Shakspeare is often harsh.

In their anger they slew a man, and in their *self*-will they digged down a wall. *Genesis xlix. 6.*

The spark of noble courage now awake,
And strive your excellent *self* to excel.

Faerie Queene.

Before the door sat *self*-consuming care,
Day and night keeping wary watch and ward. *Id.*

I have no great cause to look for other than the *self*-same portion and lot, which your manner hath been hitherto to lay on them that concur not in opinion with you. *Hooker's Preface.*

Then held she her tongue, and cast down a *self*-accusing look, finding that in herself she had shot out of the bow of her affection a more quick opening of her mind than she minded to have done. *Sidney.*

Alas! while we are wrapt in foggy mist
Of our *self*-love, so passions do deceive,
We think they hurt when most they do assist. *Id.*

Till Strephon's plaining voice him nearer drew,
Where by his words his *self*-like case he knew. *Id.*

Shoot another arrow that *self*-way
Which you did shoot the first.

Shakspeare. Merchant of Venice.

The cruel ministers, by *self* and violent hands,
Took off her life. *Shakspeare.*

My strange and *self*-abuse
Is the initiate fear that wants hard use.

Id. Macbeth.

I have heard so much,
And with Demetrius thought t' have spoke thereof;
But, being over full of *self*-affairs,
My mind did lose it.

Id. Midsummer Night's Dream.

He walks, and that *self*-chain about his neck,
Which he forswore. *Shakspeare.*

It is in my power, in one *self*-born hour,
To plant and o'erwhelm custom. *Id. Winter's Tale.*

The stars above us govern our conditions;
Else one *self*-mate and mate could not beget
Such different issues. *Shakspeare.*

I'm made of that *self*-metal as my sister,
And prize me at her worth. *Id. King Lear.*

In my school-days, when I lost one shaft,
I shot his fellow of the *self*-same flight
The *self*-same way. *Shakspeare.*

He conjunct, and flattering his displeasure,
Tript me behind: being down, insulted, railed,
Got praises of the king

For him attempting who was *self*-subdued. *Id.*

The Everlasting fixt
His cannon 'gainst *self*-slaughter. *Id. Hamlet.*

He's full of alteration

And *self*-reproving. *Id. King Lear.*

More or less to others paying,

Than by *self*-offences weighing:

Shame to him whose cruel striking

Kills for faults of his own liking! *Shakspeare.*

Self love, my liege, is not so vile a sin

As *self*-neglecting. *Id. Henry V.*

His lords desire him to have borne

His bruised helmet and his bended sword

Before him through the city: he forbids it,

Being free from vainness and *self*-glorious pride.

Shakspeare.

4. In these *self* hills the air is so thin that it is not sufficient to bear up the body of a bird. *Raleigh.*

Since consciousness always accompanies thinking, and it is that that makes every one to be what he calls *self*, and thereby distinguishes himself from all other thinking things; in this alone consists personal identity, i. e. the sameness of a rational being.

Bacon.

The most ordinary cause of a single life is liberty, especially in certain *self*-pleasing and humourous minds. *Id.*

They turn round like grindle-stones,

Which they dig out fro' the dells,

For their bairns bread, wives, and sells.

Ben Jonson.

Up through the spacious palace passed she
To where the king's proudly reposed head,

If any can be soft to tyranny,
And *self*-tormenting sin, had a soft bed. *Crashaw.*

Hast thou set up nothing in competition with God;
no pride, profit, *self*-love, or *self*-interest of thy own?

Duppa.

Seneca approves this *self*-homicide. *Hakewill.*

Thyself from flattering *self*-conceit defend,
Nor what thou dost not know, to know pretend.

Denham.

Farewell, my tears;

And, my just anger, be no more confined
To vain complaints or *self*-devouring silence. *Id.*

Repent the sin; but, if the punishment

Thou canst avoid, *self*-preservation bids. *Milton.*

Him fast sleeping soon he found,
In labyrinth of many a round *self*-rolled. *Id.*

Oft times nothing profits more
Than *self*-esteem, grounded on just and right,
Well managed. *Id. Paradise Lost.*

He sorrows now, repents, and prays contrite,
My motions in him: longer than they move,

His heart I know how variable and vain,
Self-left. *Milton.*

Flight pursued one way the *self*-same hour. *Id.*

Next to the knowledge of God, this knowledge of
our *selves* seems most worthy of our endeavour.

Hale.

They are yet more mad to think that men may rest
by death, though they die in *self*-murder, the greatest sin. *Graunt.*

With a joyful willingness these *self*-loving reformers took possession of all vacant preferments, and with reluctance others parted with their beloved colleges and subsistence. *Walton.*

This sublimer love, being, by an intimate conjunction with its object, thoroughly refined from all base dross of *selfishness* and interest, nobly begets a perfect submission of our wills to the will of God.

Boyle's Seraphick Love.

By all human laws, as well as divine, *self*-murder has ever been agreed on as the greatest crime.

Temple.

At that *self* moment enters Palamon
The gate of Venus. *Dryden.*

From Atreus though your ancient lineage came;
Yet my *self*-conscious worth, your high renown,

Your virtue, through the neighbouring nations blown. *Id.*

He has given you all the commendation which his *self*-sufficiency could afford to any. *Id.*

All these receive their birth from other things,
But from himself the phoenix only springs;

Self-born, begotten by the parent flame
In which he burned, another and the same. *Id.*

Thou first, O king! release the rights of sway;
Power, *self*-restrained, the people best obey. *Id.*

A *self*-conceited fop will swallow any thing.

L'Estrange.

It is by the consciousness it has of its present thoughts and actions, that it is *self* to it *self* now, and so will be the same *self*, as far as the same consciousness can extend to actions past or to come.

Locke.

Eighteen and nineteen are equal to thirty-seven, by the same *self*-evidence that one and two are equal to three.

Id.

I am as justly accountable for any action done many years since, appropriated to me now by this *self*-consciousness, as I am for what I did the last moment.

Id.

Each intermediate idea agreeing on each side with those two, it is immediately placed between: the ideas of men and *self*-determination appear to be connected.

Id.

Consciousness being interrupted, and we losing sight of our past *selves*, doubts are raised whether we are the same.

Id.

Body cannot be *self*-existent, because it is not *self*-moved; for motion is not of the essence of body, because we may have a definitive conception of body, abstracted from that of motion: wherefore motion is something else besides body, something without which body may be conceived to exist.

Green.

Light, which of all bodies is nearest allied to spirit, is also most diffusive and *self*-communicative.

Norris.

God, who is an absolute spiritual act, and who is such a pure light as in which there is no darkness, must needs be infinitely *self*-imparting and communicative.

Id.

Are not these strange *self*-delusions, and yet attested by common experience?

South's Sermons.

If the image of God is only sovereignty, certainly we have been hitherto much mistaken, and hereafter are to be aware of making ourselves unlike God, by too much *self*-denial and humility.

South.

Let a man apply himself to the difficult work of *self*-examination, by a strict scrutiny into the whole estate of his soul.

Id.

A fatal *self*-imposture, such as defeats the design, and destroys the force, of all religion.

Id.

When he intends to bereave the world of an illustrious person, he may cast him upon a bold *self*-opinioned physician, worse than his distemper, who shall make a shift to cure him into his grave.

Id.

This fatal hypocrisy and *self*-deceit is taken notice of in these words, Who can understand his errors! cleanse thou me from secret faults.

Addison's Spectator.

Men had better own their ignorance, than advance doctrines which are *self*-contradictory.

Id.

What could the most aspiring *selfish* man desire more, were he to form the notion of a being to whom he would recommend himself, than such a knowledge as can discover the least appearance of perfection, and such a goodness as will proportion a reward to it?

Id.

The guilt of perjury is so *self*-evident, that it was always reckoned amongst the greatest crimes, by those who were only governed by the light of reason.

Addison.

Self-sufficiency proceeds from inexperience.

Id.

By the blast of *self*-opinion moved,

We wish to charm, and seek to be beloved.

Prior.

Confidence, as opposed to modesty, and distinguished from decent assurance, proceeds from *self*-opinion occasioned by ignorance or flattery.

Collier of Confidence.

Bewildered, I my author cannot find,

Till some first cause, some *self*-existent mind,

Who formed and rules all nature, is assigned.

Blackmore.

Nick does not pretend to be a gentleman: he is a tradesman, a *self*-seeking wretch.

Arbuthnot's History of John Bull.

Every animal is conscious of some individual, *self*-moving, *self*-determining principle.

Pope and Arbuthnot. Mart. Scribb.

Shall nature, erring from her first command, *Self*-preservation, fall by her own hand? *Graville.*

Living and understanding substances do clearly demonstrate to philosophical inquirers the necessary *self*-existence, power, wisdom, and beneficence of their Maker.

Bentley.

If it can intrinsically stir itself, and either commence or alter its course, it must have a principle of *self*-activity, which is life and sense.

Id. Sermons.

The philosophers, and even the Epicureans, maintained the *self*-sufficiency of the godhead, and seldom or never sacrificed at all.

Bentley.

Matter is not endued with *self*-motion, nor with a power to alter the course in which it is put: it is merely passive, and must ever continue in that state it is settled in.

Cheyne.

I heard in Crete, this island's name;

For 'twas in Crete, my native soil, I came

Self-banished thence.

Pope's Odyssey.

Achilles' courage is furious and untractable; that of Ajax is heavy and *self*-confiding.

Pope.

What is loose love? a transient gust,

A vapour fed from wild desire,

A wandering *self*-consuming fire.

Id.

By mighty Jove's command,

Unwilling have I trod this pleasing land;

For who *self*-moved with weary wing would sweep
Such length of ocean?

Id.

They who reach Parnassus' lofty crown

Employ their pains to spurn some others down;

And, while *self*-love each jealous writer rules,

Contending wits become the sport of fools.

Id.

He can your merit *selfishly* approve,

And show the sense of it without the love.

Id.

No wonder such a spirit, in such a situation, is provoked beyond the regards of religion or *self*-conviction.

Swift.

It may be thought that Ulysses here is too ostentatious, and that he dwells more than modesty allows upon his own accomplishments; but *self*-praise is sometimes no fault.

Broome.

I took not arms till urged by *self*-defence,
The eldest law of nature.

Rowe's Ambitious Stepmother.

The fondness we have for *self*, and the relation which other things have to our *selves*, furnishes another long rank of prejudices.

Watts.

His labour and study would have shown his early mistakes, and cured him of *self*-flattering delusions.

Id.

This is not to be done in a rash and *self*-sufficient manner; but with an humble dependance on divine grace, while we walk among snares.

Id.

The religion of Jesus, with all its *self*-denials, virtues, and devotions, is very practicable.

Id.

But, hark! I'll tell you of a plot,

Though dinna ye be speaking o't;

I'll nail the *self*-conceited Scot

As dead's a herrin:

Niest time we meet, I'll wad a groat,

He gets his fairin!

Burns.

Great censoriousness is great hypocrisy. Thou hypocrite, &c., all this is nothing but the effect of woeful *self*-ignorance.

Mason.

The reason they are not better acquainted with them, is because they hate *self*-inspection.

Id.

Humility is not more necessary to salvation, than *self*-knowledge is to humility.

Id.

He trod the very *self-same* ground you tread,
And victory refuted all he said. *Cowper.*

SELF-ACCENSION, or spontaneous inflammation, the burning of a body, animal or vegetable, by a fire produced from the person or body itself.

SELF-COMMAND is that steady equanimity which enables a man in every situation to exert his reasoning faculty with coolness, and to do what the existing circumstances require. It depends much upon the natural temperament of the body, and much upon the moral cultivation of the mind. He who enjoys good health, and has braced his frame by exercise, has always a greater command of himself than a man of equal mental powers, who has suffered his constitution to become relaxed by indolence; and he who has from his early youth been accustomed to make his passions submit to his reason, must, in any sudden emergency, be more capable of acting properly than he who has tamely yielded to his passion. Hence recluse and literary men, when forced into the bustle of public life, are incapable of acting where promptness is requisite; and men who have once or twice yielded to a sense of impending danger seldom acquire afterwards that command of themselves which may be necessary to extricate them from subsequent dangers. In one of the earliest battles fought by Frederick the Great, king of Prussia, the sovereign was among the first men who quitted the field: had he done so a second and third time, he would never have become that hero whose actions astonished Europe.

SELF-DEFENCE implies not only the preservation of one's life, but also the protection of one's property, because without property life cannot be preserved in a civilised nation. The extent of property essential to life is indeed small, and this consideration may enable us to decide a question which some moralists have made intricate. By what means, it has been asked, may a man protect his property? May he kill the person who attacks it, if he cannot otherwise repel the attack? That a man, in the state or nature, may kill the person who makes an attack on his life, if he cannot otherwise repel the attack, is a truth which has never been controverted; and he may do the same in civil society, if his danger be so imminent that it cannot be exerted by the interposition of the protection provided by the state. In all possible situations, except the three following, whatever is absolutely necessary to the preservation of life may be lawfully performed, for the law of self-preservation is the first and most sacred of those laws which are impressed upon every mind by the Author of nature. The three excepted situations are those of a soldier in the day of battle, of a criminal about to suffer by the laws of his country, and of a man called upon to renounce his religion. The soldier hazards his life in the most honorable of all causes, and cannot betray his trust, or play the coward, without incurring a high degree of moral turpitude. But the soldier needs hardly be excepted; as, by the very profession in which he is engaged, while he fights for his country, he is necessarily obliged to defend himself against every individual of the

enemy, who attacks him. The criminal under sentence of death cannot, without adding to his guilt, resist the execution of that sentence; for the power of inflicting punishment is essential to society, and society is the ordinance of God. The man who is called upon to renounce his religion ought to submit to the cruellest death rather than comply with that request, since religion is his only security for future and permanent happiness. But, even in this case, Christianity allows the persecuted to fly from persecution if it be possible. In every other situation, that which is absolutely necessary to the preservation of life is undoubtedly lawful. Hence, a person sinking in water is never thought guilty of any crime, though he drag his neighbour after him by his endeavours to save himself; and a man in danger of perishing by shipwreck may drive another from a plank which cannot carry them both, for, since one of two lives must be lost, no law, human or divine, calls upon either of them to prefer his neighbour's life to his own. But though the rights of self-defence authorise us to repel every attack made upon our life, and in case of extremity to save ourselves at the expense of the life of our innocent neighbour, it is not so evident that, rather than give to an unjust demand a few shillings or pounds, we may lawfully deprive a fellow creature of life. A few pounds lost may be easily regained; but life can never be restored. If these pounds, indeed, be the whole of a man's property; if they include his clothes, his food, and the house where he shelters his head—there cannot be a doubt but that, rather than part with them, he may lawfully kill the aggressor, for no man can exist without shelter, food, and raiment. But it is seldom that an attempt is made, or is indeed practicable, to rob a man at once of all that he possesses. The important question then is, may a man put a robber to death rather than part with a small part of his property? Paley doubts whether he could innocently do so in a state of nature, 'because it cannot be contended to be for the augmentation of human happiness, that one man should lose his life or limb, rather than another a pennyworth of his property.' But we think that the protection of property by the death of the aggressor may be completely vindicated upon more general principles. It is necessary, in every state, that property be protected, or mankind could not subsist; and the sum of human happiness will be more augmented by cutting off such worthless wretches than by exposing property to perpetual depredation; and therefore, if general utility be the criterion of moral good, a man may in every case lawfully kill a robber, rather than comply with his unjust demand. But if a man may, without guilt, preserve his property by the death of the aggressor, when it cannot be preserved by any other means, much more may a woman have recourse to the last extremity to protect her chastity from forcible violation. This, indeed, is admitted by Paley himself, and will be controverted by no man who reflects on the importance of the female character, and the probable consequences of the smallest deviation from the established laws of female honor. See SEDUCTION.

SELF-EXAMINATION, a duty much insisted on by divines, and particularly the ancient fathers, by way of preparation to repentance. St. Ignatius reduces it to five points, viz:—1. A returning thanks to God for his benefits. 2. A begging of grace and light, to know and distinguish our sins. 3. A running over all our actions, occupations, thoughts, and words, to learn what has been offensive to God. 4. A begging of pardon, and conceiving a sincere sorrow for having displeased him. 5. Making a firm resolution not to offend him any more; and taking the necessary precautions to preserve ourselves from it.

SELF-KNOWLEDGE, the knowledge of one's own character, abilities, opinions, virtues, and vices. This has always been considered as a difficult though important acquisition. It is difficult, because it is disagreeable to investigate our errors, our faults, and vices; because we are apt to be partial to ourselves, even when we have done wrong; and because time and habitual attention are requisite to enable us to discover our real character. But these difficulties are more than counterbalanced by the advantages of self-knowledge. By knowing the extent of our abilities, we shall never rashly engage in enterprises where our ineffectual exertions may be productive of harm: by investigating our opinions, we may discover those which have no foundation, and those also which lead us insensibly into vice. By examining our virtues and vices, we shall learn what principles ought to be strengthened, and what habits ought to be removed. One of the first advices of the philosophers of antiquity was, Know thyself. It is difficult to lay down rules for the acquisition of this self-knowledge, because almost every man is blinded by a fallacy peculiar to himself. But, when one has got rid of that partiality which arises from self-love, he may easily form a just estimate of his moral improvements, by comparing the general course of his conduct with the standard of his duty; and, if he has any doubt of the extent of his intellectual attainments, he will most readily discover the truth by comparing them with the attainments of others who have been most successful in the same pursuits. Should vanity arise in his mind from such a comparison, let him then compare the extent of his knowledge with what is yet to be known, and he will then be in no danger of thinking of himself more highly than he ought to think.

SELF-LOVE is that instinctive principle which impels every animal, rational and irrational, to preserve its life and promote its own happiness. It is very generally confounded with selfishness; but the one propensity is quite distinct from the other. Every man loves himself; but every man is not selfish. The selfish man grasps at all immediate advantages, regardless of the consequences which his conduct may have upon his neighbour. This principle is the parent of every vice and crime that disgrace human nature. Self-love only prompts him who is actuated by it to procure to himself the greatest possible sum of happiness during the whole of his existence. Self-love, as distinguished from selfishness, always comprehends the whole of a

man's existence; and, in that extended sense of the phrase, every man is a self-lover; for, with eternity in his view, it is surely not possible for the most disinterested of the human race not to prefer himself to all other men, if their future and everlasting interests could come into competition. But this they never can do; for in the pursuit of a prize which is to be gained only by sobriety, righteousness, and piety, there can be no rivalry; the success of one being no injury to another. It has been a question in morals, whether self-love be not the incentive to every action, however virtuous or apparently disinterested? Those who maintain the affirmative say that the prospect of immediate pleasure, or the dread of immediate pain, is the only apparent motive to action in the minds of infants, and indeed of all who look not before them, and infer the future from the past. They own that when a boy has had some experience, and is capable of making comparisons, he will often decline an immediate enjoyment which he has formerly found productive of evil more than equivalent to all its good; but in doing so they think justly, that he is still actuated by the principle of self-love, pursuing the greatest good of which he knows himself to be capable. After experiencing that truth, equity, and benevolence in all his dealings is the readiest, and indeed the only certain method of securing to himself the kindness and good offices of his fellow-creatures, and much more when he has learned that they will prove infinitely advantageous to him in a future world, they admit that he will practise truth, equity, and benevolence; but still, from the same principle, pursuing his own ultimate happiness as the object which he has always in view. The prospect of this great object will make him feel an exquisite pleasure in the performance of the actions necessary to its attainment, till at last, without attending to their consequences, he will, by the great associating principle, feel a refined enjoyment in the actions themselves, and perform them, as occasions offer, without deliberation or reflection. Such, they think, is the origin of benevolence itself, and of every other virtue. Those who take the other side of the question can hardly deny that self-love, thus modified, may prompt to virtuous and apparently disinterested conduct; but they think it degrading the dignity of man to suppose him actuated solely by motives which can be traced back to a desire of his own happiness. The other theory supposes that the exciting motive is the hope of future happiness, and the dread of future misery; the instinctive scheme supplies a present motive, in the self-complacency arising in the heart from a consciousness of right conduct. The former is a rational motive; the latter has nothing more to do with reason than the enjoyment arising from eating or drinking, or from the intercourse between the sexes. But we need not pursue the subject farther, but conclude with observing that there is certainly a virtuous as well as a vicious self-love, and that

'All true self-love and social are the same.'

SELF-MURDER. See **SUICIDE**.

SELF-PARTIALITY is a phrase employed by some philosophers to express that weakness

of human nature through which men overvalue themselves when compared with others. (See Lord Kaimes's *Art of Thinking*). It is distinguished from general partiality, because it is thought that a man is led to over-rate his own accomplishments, by a process of intellect different from that by which he over-rates the accomplishments of his friends or children. The former kind of partiality is wholly selfish; the latter partakes much of benevolence. This distinction may perhaps be deemed plausible by those who consider the human mind as little more than a bundle of instincts; but it must appear ridiculous to such as resolve the greater part of apparent instincts into early and deep-rooted associations of ideas. If the partialities which most men have to their friends, their families, and themselves, be instinctive, they are certainly instincts of different kinds; but an instinctive partiality is a contradiction in terms. Partiality is founded on a comparison between two or more objects; but genuine instincts form no comparisons. See *INSTINCT*. The origin of self-partiality is not difficult to be found; and our partialities to our friends may be traced to a similar source. By the constitution of our nature we are impelled to shun pain, and to pursue pleasure; but remorse, the severest of all pains, is the never-failing consequence of vicious conduct. By magnifying to himself the temptations which led him astray, and diminishing the injuries which his conduct has done in the world, and by adopting a course diametrically the reverse when estimating the morality or immorality of the conduct of his neighbours, one soon becomes to believe that he is at least not more wicked than they. Thus is self-partiality formed in the mind, and quickly blinds him who is under its influence so completely, as to hide from him the very faults which he sees and blames in others. Partiality is formed in the very same manner to natural or acquired accomplishments, whether mental or corporeal. These procure respect to him who is possessed of them; and, as respect is accompanied with many advantages, every man wishes to obtain it for himself. If he fail in his attempts, he consoles himself that it is due to his merits, and is only withheld by envy. He compares the particular branch of science or bodily accomplishment in which he himself most excels, with those which have conferred splendor on his rival; and finds that his own excellencies are of the highest order, and entitled to the greatest share of public esteem. Hence the polite scholar despises the mathematician; the reader of Aristotle and Plato all the modern discoveries in physical and moral science; and the mere experimentalist holds in contempt a critical knowledge of the ancient languages. The pupil of the ancients denies the merits of the moderns, whilst the mere modern allows nothing to the ancients; and thus each becomes partial to his own acquisitions, and of course to himself, for having been at the trouble to make them. All partialities are prejudices of the worst kind. They ought therefore to be guarded against with the utmost care. And he who is partial to his own virtue or knowledge, will do well to compare the former, not

with the conduct of his neighbour, but with the express rule of his duty; and to consider the latter as no farther valuable than as it contributes to the sum of human happiness.

SELIM I., emperor of the Turks, was the second son of Bajazet II. He made war upon his father, and, though defeated in 1511, he at last dethroned him, took him prisoner, and poisoned him, with his elder brother Achmet, and his younger Korkud, an amiable and enlightened prince. He next marched against Campson Gaury, sovereign of Egypt, gained a great victory at Aleppo, and slew their general. But, though the sultan perished in that battle, the Mamelukes determined to oppose the emperor. Selim, entering their country at the head of his army, defeated the Egyptians in two battles, and ordered Tumanbey, the new elected sultan, who had fallen into his hands, to be hanged. He then took Cairo and Alexandria, and soon reduced all Egypt. Thus ended the dominion of the Mamelukes in Egypt, which had continued for more than 260 years. See *EGYPT*. He confirmed the ancient privileges of the Venetians in Egypt and Syria, by which they carried on their commerce with India, and formed a league with them to destroy the power of the Portuguese in that country. Selim had before this gained a great victory over the Persians, and stripped them of Tauris and Keman. He was preparing to attack Christendom, when he was seized with an ulcerous sore in the back. Thinking that the air of Adrianople would restore his health, he ordered himself to be conducted thither; but he died at Clari in Thrace, on his road to that city, in 1520, in the very spot where he had poisoned his father. He reigned eight years and lived fifty-four. He was a prince of great courage, sobriety, and liberality; he was fond of history, and wrote some verses. But these good qualities were obscured by the most abominable crimes that ever disgraced human nature: he made his way to the throne by shedding the blood of his father, and secured it by murdering his brothers and eight nephews, and every bashaw who had been faithful to his duty.

SELIM II., the son of Solyman II. and grandson of Selim I., succeeded his father in 1566. He made a truce for eight years with the emperor Maximilian, and confirmed his father's treaty with the Venetians; but, in 1570, declared war against them, and took Cyprus, where his general Mustapha committed great cruelties. In 1571 he lost the battle of Lepanto, which threw all Constantinople into consternation, and obliged him to make peace with the emperor. He died in 1574, aged fifty-two, with the character of a weak and dissolute prince.

SELINGUNSTAD, or **SELIGENSTADT**, a town in Hesse-Darmstadt. Population, 2300.

SELINTY, a cape of Caramania, in Asia Minor, formed by a romantic headland, on which are the ruins of the ancient Trajanopolis. The hill rises steeply from the plain, and breaks off into a chain of magnificent cliffs. On the highest point are the ruins of a castle, which commands the hill in every direction, and looks perpendicularly down upon the sea. The ancient line of fortification is marked by a wall, within

which there are many remains of houses; while outside of them, between the foot of the hill and the river, are the remains of large buildings. The most remarkable of these is a low edifice, of about seventy feet by fifty, the top of which is flat, and which appears to have been formerly the basement of some splendid structure. It stands in the centre of a quadrangle, along each side of which there was a row of thirty small columns; but they have been all broken off close to the ground. Lower down the river are the remains of a small theatre. Near its mouth are some baths; and fronting the theatre is a long ruined aqueduct on arches, which, crossing the stream, communicates with a distant hill. At the south-east point of the hill are numerous tombs. The coast is marked by petrified gravel, which, at a distance, has the appearance of loose stones; but, on approaching, proves to be a solid crust of pudding stone. The ancient city was called originally *Selinus*, until Trajan gave his own name to it.

SELINUM, in botany, milk parsley, a genus of the di ignia order, and pentandria class of plants; natural order forty-fifth, umbellatae. The fruit is oval, oblong, compressed, plane, and striated in the middle; the involucre is reflexed; the petals cordate and equal. There are seven species, viz.

S. carvifolia, Chabrei, *cutriacum*, Monnici, palustre, *seguieri*, and *sylvestre*.

SELINUNS, **SELINUS**, or **SELINUNTUM**, in ancient geography, a town on the south of Sicily, founded A. U. C. 127, by a colony from Megara. It was so named from *σέλινον*, parsley, which it abounded with. It was anciently a place of great importance, as is proved by the venerable relics of its ruins still visible at Mazara which was built on its site.—Paus. vi. c. 19.

SELINUS, or **SELINUNT**, a celebrated ancient city on the south coast of Sicily, at the mouth of the Heraclea. Its ruins are seen about seven miles south of Castro Vetrano, and are described as of enormous bulk. From the traces of the walls, the town appears to have been built in the form of a horse-shoe, having a port in the centre; but the latter is now filled up. The chief ruins are two temples, of great extent. A stone of one of them has been lately found to measure twenty-one feet in length, five feet eight inches in height, and six feet nine inches in breadth. On the west side, the walls are in a considerable degree of perfection; and there are two vast flights of steps between this port and the upper part of the city.

SELINUS, in ancient geography, the name of six rivers; viz. one each in Achaia, Cilicia, Elis, and Sicily; and of two in Ephesus: also, 7. of a town in Cilicia, where Trajan died: and, 8. of a lake at the origin of the Cayster.—Livy Strabo, Pliny.

SELISIA, a river of Maritime Austria, in Friuli, which joins the Cobera and forms the Meduna.

SELKIRK (Alexander), whose adventures gave rise to the well-known historical romance of Robinson Crusoe, was born at Largo, in Fife, in 1676, and was bred a seaman. He went from England in 1703, in the capacity of master of a

small vessel called the *Cinque Ports*, Charles Pickering captain, burthen about ninety tons, with sixteen guns, and sixty-three men; and in September the same year sailed from Cork, in company with another ship of twenty-six guns, and 120 men, called the *St. George*, commanded by that famous navigator William Dampier, intending to cruise against the Spaniards in the South Sea. On the coast of Brasil Pickering died, and was succeeded in his command by his lieutenant Stradling. They proceeded on their voyage round Cape Horn to the island of Juan Fernandez, whence they were driven by the appearance of two French ships of thirty-six guns each, and left five of Stradling's men there on shore, who were taken off by the French. Hence they sailed to the coast of America, where Dampier and Stradling quarrelled, and separated by agreement, on the 19th of May, 1704. In September following, Stradling came again to the island of Juan Fernandez, where Selkirk and his captain had a difference, which, with the circumstance of the ship's being very leaky and in bad condition, induced him to determine on staying there alone; but, when his companions were about to depart, his resolution was shaken, and he desired to be taken on board. The captain, however, refused to admit him, and he was obliged to remain, having nothing but his clothes, bedding, a gun, and a small quantity of powder and ball; a hatchet, knife, and kettle; his books, and mathematical and nautical instruments. He kept his spirits tolerably till he saw the vessel put off, when (as he afterwards related) his heart yearned within him, and melted at parting with his comrades and all human society at once.

Such is the rooted love we bear mankind,
All ruffians as they are. *Thomson.*

Left sole monarch of the island, with plenty of the necessities of life, he found himself in a situation hardly supportable. He had fish, goat's flesh, turnips and other vegetables; yet he grew dejected, languid, and melancholy, to such a degree as to be scarcely able to refrain from doing violence to himself. Eighteen months passed before he could, by reasoning, reading his Bible, and study, be thoroughly reconciled to his condition. At length he grew happy, employing himself in decorating his huts, chasing the goats, whom he equalled in speed, and scarcely ever failed of catching. He also tamed young kids, and kept a guard of tame cats about him, to defend him when asleep from the rats, which were very troublesome. When his clothes were worn out, he made others of goat skins, but could not succeed in making shoes, with the use of which, however, habit, in time, enabled him to dispense. His only liquor was water. He computed that he had caught 1000 goats during his abode in the island; of which he had let go 500, after marking them by slitting their ears. Commodore Anson's people, who were there about thirty years after, found the first goat which they shot upon landing was thus marked, and, as it appeared to be very old, concluded that it had been under the power of Selkirk. He made companions of his tame goats and cats, often dancing and singing with them; but he dreaded

nothing so much as the thought of being eaten by his cats when he should be dead. Though he constantly performed his devotions at stated hours, and read aloud; yet, when he was taken off the island, his language, from disuse of conversation, was become scarcely intelligible.

In this solitude he continued four years and four months; during which time only two incidents happened which he thought worth relating, the occurrences of every day being in his circumstances nearly similar. The one was, that pursuing a goat eagerly, he caught it just on the edge of a precipice, which was covered with bushes, so that he did not perceive it, and he fell over to the bottom, where he lay (according to captain Rogers's account) twenty-four hours senseless; but, as he related it to Sir R. Steele, he computed, by the alteration of the moon, that he had lain three days. When he came to himself he found the goat lying under him dead. It was with great difficulty that he could crawl to his habitation, whence he was unable to stir for ten days, and did not recover of his bruises for a long time. The other event was the arrival of a ship, which he at first supposed to be French; and such is the natural love of society in the human mind, that he was eager to abandon his solitary felicity, and surrender himself to them, although enemies; but upon their landing, approaching them, he found them to be Spaniards, of whom he had too great a dread to trust himself in their hands. They were by this time so near that it acquired all his agility to escape, which he effected by climbing into a thick tree, being shot at several times as he ran off. Fortunately the Spaniards did not discover him, though they stayed some time under the tree where he was hid, and killed some goats just by. In this solitude Selkirk remained until the 2d of February 1709, when he saw two ships come into the bay, and knew them to be English. He immediately lighted a fire as a signal; and, on their coming on shore, found they were the Duke, captain Rogers, and the Duchess, captain Courtney, two privateers from Bristol. He gave them the best entertainment he could afford; and, as they had been a long time at sea without fresh provisions, his goats were highly acceptable. His habitation, consisting of two huts, one to sleep in, the other to dress his food in, was so obscurely situated, and so difficult of access, that only one of the ship's officers would accompany him to it. Dampier, who was pilot on board the Duke, and knew Selkirk very well, told captain Rogers that, when on board the *Cinque Ports*, he was the best seaman on board that vessel; upon which captain Rogers appointed him master's mate of the Duke. After a fortnight's stay at Juan Fernandez, the ships proceeded on their cruise against the Spaniards; plundered a town on the coast of Peru; took a Manilla ship off California, and returned by way of the East Indies to England, where they arrived the 1st of October 1711, Selkirk having been absent eight years, more than half of which he had spent alone in the island. Captain Cook remarks, as an extraordinary circumstance, his keeping an account of the days of the week and month; but this might be done, as Defoe makes Robinson

Crusoe do, by cutting notches in a post, or many other methods. A story was raised and propagated by Daniel Defoe's malignant enemies, that Selkirk put his papers into Defoe's hands, to arrange and form them into a regular narrative, and that from these papers he formed his celebrated *Adventures of Robinson Crusoe*. But, not to mention that Selkirk had no means of writing a journal whilst he was upon the island, so dishonest an action does not correspond with Defoe's general character. We therefore refer our readers, for what appears to us to be the truth to our article *DRONE*. Of the time, or place, or manner of this extraordinary man's death we have no account; but in 1792 the chest and musket which Selkirk had with him on the island were in the possession of his grand-nephew, John Selkirk weaver of Largo, in Scotland.

SELKIRK, the capital of Selkirkshire, is a small town pleasantly situated on a rising ground, and enjoys an extensive prospect in all directions, especially up and down the *Etterick*. It was a royal borough, and joined with Lanark, Linlithgow, and Peebles, in sending a member to the British parliament. It is governed by two bailies, a dean of guild, treasurer, and ten counsellors. The citizens were anciently famous for their valor. Of 100, who followed James IV. to the fatal battle of Flodden, in 1513, a few returned with trophies of victory, some of which are still preserved, and the sword of William Brydon, the town clerk, who commanded them. The English, provoked with their desperate valor, burned their town; but James V. rewarded them by a grant of the wood and ground of an extensive tract of *Etterick* forest. It has manufactures of boots, shoes, and inkle. The town, till of late, was but poorly built, but lately it has been greatly improved; the streets have been levelled and paved, the old gaol, and another house which stood in the middle of the street have been removed, and many new houses have been built in a good style, together with a new town house, containing apartments for the town and sheriff's court and a library; it has a handsome spire and clock. A new prison has also been erected at the back of the town, with a spacious area, enclosed with a wall, for the use of the prisoners. It has fairs March 25th, April 15th, August 10th, October 20th, and December 8th, O. S. It is thirty miles south-east of Edinburgh, and thirty south-west of Berwick.

SELKIRK, of SELKIRKSHIRE, called also the sheriffdom of *Etterick Forest*, a county of Scotland, extending about twenty-four miles in length from east to west, and from eight to fifteen in breadth from south to north. It is bounded on the north by Peebles-shire; east by Berwick-shire; south-east and south by Roxburghshire; south-west by Dumfries-shire; and west by Peebles-shire. This county was formerly reserved by the Scottish princes for the pleasure of the chase, and they had houses for the reception of their train. At that time the face of the country was covered with woods, in which there were great numbers of red and fallow deer, whence it had the name of *Etterick Forest*. The woods, however, are now almost entirely cut down, and the county is chiefly supported by the breed of

sheep. They are generally sold into England, but sometimes into the Highlands, in March, where they are kept during summer; and, after being improved by the mountain grass, are returned into the Lowlands in the beginning of winter. This county, though not very populous at present, was once the nurse of heroes, who were justly accounted the bulwark of their native soil, being ever ready to brave danger and death in its defence. Of this we have a memorable proof in the pathetic lamentations of their wives and daughters for the disaster of the field of Floddon, 'where their brave foresters were a'wed away.' The rivers Etterick and Yarrow unite a little above the town of Selkirk, and terminate in the Tweed. For five miles above its junction with Etterick, the Tweed is still adorned with woods, and leads the pleased imagination to contemplate what this country must have been in former times. The Yarrow, for about five miles above its junction with the Etterick, exhibits nature in a bold and striking aspect. Its native woods still remain, through which the stream has cut its turbid course, deeply engulfed amidst rugged rocks. Here in a flood stood the descriptive Thomson when he saw it.

Work and boil, and foam and thander through.

Upon a peninsula, cut out by the surrounding steam, in the middle of this fantastically wild scene of grandeur and beauty, stands the castle of Newark.

SELL, *v. a. & v. n.* } Sax. *ryllan*; Island.
SELLER, *n. s.* } *selu*. To give for a price; the word correlative to buy; to vend; to have traffic: a seller is a vender.

The Midianites sold him into Egypt, unto Potiphar. *Genesis.*

Let us sell him to the Ishmaelites.

Id. xxxvii. 27.
Consult not with a buyer of selling.

Eccles. xxxvii. 11.
You would have sold your king to slaughter,
His princes and his peers to servitude. *Shakspeare.*
I will buy with you, sell with you; but I will not eat with you. *Id.* *Merchant of Venice.*
To things of sale a seller's praise belongs.

Shakspeare.
This sense is likewise mistress of an art,
Which to soft people sweet perfumes doth sell.

Darius.
All the inns and public houses are obliged to furnish themselves with corn, which is sold out at a much dearer rate than 'tis bought up.

Addison on Italy.
The name of the agent, or the seller, notary, and witnesses, are in both instruments. *Id.*

You have made an order that ale should be sold for three halfpence a quart. *Swift.*

SELLIUS (Godfrey), F. R. S., a learned historian and naturalist, born at Dantzic. He resided chiefly in France. He wrote 1. A Voyage to Hudson's Bay; 2. A Dictionary of Monograms; 3. The Natural History of Ireland; 4. History of the Ancient Revolutions of the Globe. He died in France in 1767.

SELTZER WATER, a mineral water which springs up at Lower Seltzer, is very useful medically. It contains, according to some, a very small portion of calcareous earth, of a native mineral alkali, and an acid; but of these the

quantity is too small to attribute any medicinal virtues to; but it contains also nearly one-seventh of its bulk of fixed air, which is more than is found in any other mineral water, and to this it owes its principal virtues. Others have said that it is of the same nature with Pyrmont water (see MINERAL WATERS), and contains a subtle aqueous fluid, a volatile iron, and a predominant alkali, all joined together into one brisk spirituous water. The consequence of these different opinions respecting its constituent parts is that different methods have been recommended for imitating it.

From the experiments of Dr. Brocklesby on Seltzer water we learn that, upon dropping twelve drops of very highly colored syrup of violets into a wine-glass of it, the syrup seemed first to manifest a purple hue, but, upon their intimate union, the whole changed into a beautiful green: that the same quantity of oil of tartar per deliquium dropped into a glass of sparkling, fresh, clear water, quickly turned the whole milky, and, after standing, a fine pearl-colored powder fell to the sides and bottom of the glass; on adding an equal number of drops of pure dephlegmated spirit of vitriol to a glass of this water, a light cloud was seen suspended towards the middle of the glass, and numerous air-bubbles rose from all parts of the water, and the sparkling might be renewed by adding one or more drops of the acid, and shaking the glass; and the like ebullition was more readily produced by a solution of sugar and Rhenish wine, or vinegar with the same: and the same appearances were exhibited by dropping any vegetable or mineral acids into this water, as are observed when alkalies and acids are mixed together: a volatile caustic alkali, in half an hour after it had been dropped into this water, produced at first a cloud and afterwards a precipitation. Lixivium saponarium so far decomposed a glass of Seltzer water, that a cloud instantly appeared in the middle of it, and the air-bubbles, emerging from the lower part of it, were greedily absorbed by the caustic alkali, which is known to imbibe fixed air, whenever it comes into contact with it. This water, says Dr. Brocklesby, poured into a glass, separates more air-bubbles than any other water which he had tried, and continues longer to do so in the open air; but its sparkling may be renewed by adding any sub-acid vegetable, and a little sugar, as sharp cyder and Rhenish wine and sugar; but he adds that the best Seltzer water here will not perfectly curdle milk, nor lather with soap, and that with powder of gall-nuts no farther change of color appeared than in pure water. By evaporating twenty-four ounces of the best Seltzer water, he obtained thirty-six grains of a saline residuum; and the greatest quantity he could ever get from a pint, wine measure, was less than thirty grains. Ten drops of strong spirits of vitriol, poured on as many grains of salt of Seltzer water, caused great and instant ebullition, and suffocating steam, which tinged blackish a silver spoon held in them, and gave to its polished surface a bitter taste.

Having dissolved sixty-six grains of pure white salt, obtained from this water, in distilled water, and filtrated it, he thereby obtained seven

grains of a calcareous earth, perfectly soluble in all weak acids; but by several different modes of trial he was led to conclude that this water contains no ferruginous principle.

Finding that the salts and earths contained in Seltzer water are too inconsiderable, both in quantity and quality, to promise any very material medicinal effects, he proceeded to investigate what might be ascribed to the great quantity of fixed air which this water constantly discharges, in a heat not exceeding that of the human body; and the result was, that the factitious air, yielded by a bottle full of water, containing exactly fourteen ounces seven drachms, in a heat never exceeding 116° by Fahrenheit's scale, amounted to a quantity which occupied a space that required two ounces two and a half drachms of water to fill it; or, allowing 265 grains of common water for a cubic inch, the whole water amounted to twenty-seven cubic inches, and that which would fill the space occupied by the air four ounces and one-fifth; and so large a quantity of interstitial air, he says, was generated in a heat not incompatible with life in any part of the world, as the ever heats in all climates testify, and less than the heat which is often experienced without instantaneous prejudice, in some tropical climates. However, this generated air soon began to be re-absorbed into the body of the water, and, in about eight hours, the space occupied by the remaining air did not exceed one-fifth of what it had formerly done. From another experiment with the salt of Seltzer water, he found that this seemed to have let go much the greatest part of its fixed air, and probably thereby lost most of the virtues inherent in the pure fresh water itself.

From such experiments Dr. Brocklesby infers that Seltzer mineral water contains, besides the mere elementary water, a very small quantity of calcareous earth, and a much greater portion of a native mineral alkali, together with some acid retained while within the water, but which either evaporates into the open air, or else is soon combined with the mineral alkali: and he thinks it probable that the active virtues of this water depend more on this elastic matter, or fixed air, which it contains in such uncommon abundance beyond other mineral waters, than in any combination of its saline and earthy contents, which are found in such small quantities as to be incapable of any material service, though this water is known to be exceedingly beneficial. This account of the analysis of Seltzer water is closed with the history of some medical cases, in which the use of this water completed a cure, after a great variety of other remedies had proved insufficient.

The operation of this water, according to Hoffman, is chiefly by urine, for it has no purgative virtues. It corrects acidities, renders the blood and juices more fluid, and promotes a brisk and free circulation; and, therefore, it is good in obstructions of the glands, and against gross and viscid humors. It is of great use in the gravel and stone, and other disorders of the kidneys and bladder. It is also excellent in gouty and rheumatic complaints, especially when mixed with milk, or improved by the addition of Rhenish wine and a little sugar. It is drunk with great success in scorbutic, cutaneous, and

putrid disorders. It relieves the heart-burn, and is an excellent stomachic. On account of its diuretic quality, it is serviceable in dropsical complaints: and, mixed with asses' milk, it is much recommended in consumptive cases, and in disorders of the lungs; with or without milk, it is in great esteem in nervous disorders, and also in hypochondriacal and hysteric complaints, and in obstructions of the menses, accompanying the use of it with proper exercise. It is also administered with success in purging and fluxes arising from acidity in the bowels; and, it is said, if drunk by nurses, to render their milk more wholesome and nourishing, and to prevent it from turning sour on the stomachs of children. See London Med. Observ. vol. iv. p. 7, &c., and our own article MINERAL WATERS.

According to the former analysis, artificial Seltzer water may be prepared by adding one scruple of magnesia alba, six scruples of fossil alkali, and four scruples of common salt, to each gallon of water, and saturating the water with fixed air or carbonic acid. According to the latter it may be imitated by adding to a quart of the purest and lightest water thirty drops of a strong solution of iron made in spirit of salt, a drachm of oil of tartar per deliquium, and thirty drops of spirit of vitriol, or a little more or less as is found necessary, not to let the alkali of the oil of tartar prevail too strongly, though it must prevail a little. If the proportions be carefully observed, and the whole of these ingredients shaken briskly together, the artificial Seltzer or Pyrmont water thus made will strongly resemble the natural, and have the same good effect in medicine. But, as fixed air is the only efficacious medicinal part of the composition of Seltzer water, the best method of imitating it is by impregnating common water with that acid by a process for which we are indebted to Dr. Priestley. In 1767, having placed shallow vessels of water within the region of fixed air, on the surface of the fermenting vessels of a brewery, and left them all night in that situation, he found that the water had acquired a very sensible and pleasant impregnation. He proceeded to accelerate the impregnation by pouring the water from one vessel into another, while they were both held within the sphere of the fixed air. The method of effecting this by air dislodged from chalk and other calcareous substances did not occur to him till 1772, when he published his directions for this purpose, together with a drawing of the necessary apparatus, which he had before communicated to the board of admiralty. That apparatus afterwards gave way to another, invented by Dr. Nooth.

Dr. Withering of Birmingham after this contrived a new apparatus for impregnating water with fixed air, which, he says, is preferable to that in common use, because it can be made at less expense, and is more easily prepared; because the whole quantity of fixable air produced is converted to use without any waste of the vitriolic acid; because it impregnates three times the quantity of water at one time, more completely, and with less trouble; and the impregnated water will always retain its virtue, if the joints and cocks of the machine are perfectly

air-tight; for which purpose they should once a-year be supplied with a small quantity of unsalted lard.

SELVAGE, *n. s.* Of this word I know not the etymology, says Johnson. Skinner thinks selvage is said as salvage, from its saving the cloth. Mr. Thomson says, Belg. *zelfegg*, or *zelveeg* from *zeil*, a cord, and *voege*, a joining. The edge of cloth where it is closed by complicating the threads.

Make loops of blue upon the edge of the one curtain from the *selvage* in the coupling. *Ex. xxvi. 4.*

SEMayLA, a gold mine of Bamboek, in Central Africa. It is situated in a hillock about 200 feet high, and 5000 in circumference. The gold is contained in a kind of reddish sandstone, extremely hard, mixed with a species of calculeous emery, and very hard red marble. At the depth of about thirty feet, the miners find a solid stratum of red marble, richly impregnated with gold, upon which their skill does not enable them to make any impression. The difficulties in working cause the mine of Semayla, though the richest in Bamboek, to be considered only of secondary value.

SEMBLE, *v. n.*

SEMBLABLE, *adj.*

SEMBLABLY, *adv.*

SEMBLANCE, *n. s.*

SEMBLANT, *adj. & n. s.*

SEMBLATIVE, *adj.*

semblance is, likeness; similitude: semblant, resembling; show; figure: semblative, suitable; fit; resembling.

Her purpose was not such as she did feign,
Ne yet her person such as it was seen;

But under simple show, and *semblant* plain,
Lurks false Duessa, secretly unseen.

Faerie Queene.

Full lively is the *semblant*, though the substance dead.

Spenser.

Be you the soldier, for you likest are,
For manly *semblance*, and for skill in war.

Id.

Then be abhorred

All feasts, societies, and throngs of men!

His *semblable*, yea himself, Timon disdains.

Shakspeare.

A gallant knight he was, his name was Blunt;

Semblably furnished like the king himself.

Id. Henry IV.

Solicit Henry with her wondrous praise:

Bethink thee on her virtues that surmount

Her natural graces, that extinguish art:

Repeat their *semblance* often.

Shakspeare.

Diana's lip

Is not more smooth and ruby; thy small pipe

Is as the maiden's organ shrill and sound;

And all is *semblative* a woman's part.

Id. Twelfth Night.

Their *semblance* kind, and mild their gestures were,

Peace in their hands, and friendship in their face.

Fairfax.

He with high words, that bore

Semblance of worth, not substance, gently raised

Their fainting courage, and dispelled their fears.

Milton.

With *semblable* reason we might expect a regularity in the winds.

Brace's Vulgar Errors.

Thy picture, like thy fame,

Entire may last; that, as their eyes survey

The *semblant* shade, men yet unborn may say,

Thus great, thus gracious, looked Britannia's queen;
Her brow thus smooth, her look was thus serene.

Prior.

Let Europe, saved, the column high erect,
Than Trajan's higher, or than Antonine's,

Where *sembling* art may carve the fair effect

And full achievement of thy great designs.

Id.

This last effort brought forth the opinion that these bodies are not what they seem to be; that they are no shells, but mere sportings of active nature, and only *semblances* or imitations of shells.

Woodward.

If they (early impressions) will not bear this after hard rubbing, they must be dismissed, as no genuine principles of truth, but as counterfeits imposed upon us under guise and *semblance* of it.

Mason.

It is not his meaning that we put on the outward face and *semblance* of virtue, only to conceal and disguise our vice.

Rogers.

SEMECARPUS, in botany, a genus of the trigynia order, belonging to the pentandria class of plants: cor. quinquepetalous; the drupa is heart-shaped, cellulous, and monospermous. There is but one species.

SEMELE, in mythology, the daughter of Cadmus by Hermione, the daughter of Mars and Venus. She was beloved by Jupiter, and had received his visits. Juno, becoming jealous, visited her in the form of her nurse Beroe, and advised her to ask Jupiter next time he should visit her to honor her by coming in all his glory, as he visited Juno. Semele, having obtained his promise of whatever she should ask, confirmed by Styx, made her request. The god of thunder was thunder-struck; but being bound by oath was obliged to comply, and Semele perished in celestial fire. But being six months gone with child of Bacchus, the child was preserved, and sewed up for other three months in Jupiter's thigh; during which period the god is said to have limped, as the votaries of Bacchus have often done since. But when Bacchus grew up, and visited the infernal regions, he was permitted to bring back his mother to life again. She was worshipped under the name of Thyone, at Brasia in Laconia, which she had visited with her son. See **BACCHUS**, **MYSTERIES**, and **MYTHOLOGY**.

SEMEN, in botany, seed. See **BOTANY**, **Index**. With respect to number, plants are either furnished with one seed, as sea-pink and bistort; two, as wood-roof and the umbelliferous plants; three, as spurge; four, as the lip-flowers of Tournefort and rough-leaved plants of Ray; or many, as ranunculus, anemone, and poppy. The form of seeds is likewise extremely various, being large or small, round, oval, heart-shaped, kidney-shaped, angular, prickly, rough, hairy, wrinkled, sleek or shining, black, white, or brown. Most seeds have only one cell or internal cavity; those of lesser burdock, valerian, lamb's lettuce, cornelian cherry, and sebesten, have two. With respect to substance, seeds are either soft, membranaceous, or of a hard bony substance; as in gromwell, tamarind, and all the nuciferous plants. In point of magnitude, seeds are either very large, as in the cocoa-nut; or very small, as in campanula, ammannia, and throat-wort. With respect to situation they are either dis-

persed promiscuously through the pulp (*semina nidulanta*), as in water-lily; affixed to a suture or joining of the valves of the seed-vessel, as in the cross-shaped and pea-bloom flowers; or placed upon a placenta or receptacle within the seed vessel, as in tobacco and thorn-apple. Seeds are said to be naked (*semina nuda*) which are not contained in a cover or vessel; such are those of the lip and compound flowers, the umbelliferous and rough-leaved plants; covered seeds (*semina tecta*) are contained in some vessel, whether of the capsule, pod, berry, apple, or cherry kind. A simple seed is such as bears neither crown, wing, nor downy pappus; the varieties in seeds, arising from these circumstances, are particularly enumerated under their respective heads. In assimilating the animal and vegetable kingdoms, *Linnaeus* denominates seeds the eggs of plants. The fecundity of plants is frequently marvellous; from a single plant or stalk of Indian Turkey wheat, are produced, in one summer, 2000 seeds; of elecampane 3000; of sun-flower 4000; of poppy 32,000; of a spike of cat's tail 10,000 and upwards; a single fruit, or seed vessel of tobacco, contains 1000 seeds; that of white poppy 8000. Mr. Ray relates, from experiments made by himself, that 1012 tobacco-seeds are equal in weight to one grain; and that the weight of the whole quantum of seeds in a single tobacco plant is such as must, according to the above proportion, determine their number to be 360,000. The same author estimates the annual produce of a single stalk of spleen-wort to be upwards of 1,000,000 of seeds. The dissemination of plants respects the different methods or vehicles by which nature has contrived to disperse their seeds for the purpose of increase. These by naturalists generally reckoned four:—1. Rivers and running waters. 2. The wind. 3. Animals. 4. An elastic spring, peculiar to the seeds themselves. 1. The seeds which are carried along by rivers and torrents are frequently conveyed many hundreds of leagues from their native soil, and cast upon a very different climate, to which, however, by degrees, they render themselves familiar. 2. Those which are carried by the wind are either winged, as in fir-tree, trumpet-flower, tulip-tree, birch, arbor-vitæ, meadow rue, and Jessamine, and some umbelliferous plants; furnish with a pappus, or downy crown, as in valerian, poplar, reed, succulent swallow-wort, cotton-tree, and many of the compound flowers; placed within a winged calyx or seed-vessel, as in scabious, sea-pink, dock, dioscorea, ash, maple, and elm-trees, logwood and woad; or, lastly, contained within a swelled calyx or seed-vessel, as in winter-cherry, cucubalus, melilot, bladder-nut, fumitory, bladder-sena, heart seed, and chick-peas. 3. Many birds swallow the seeds of vanelloe, juniper, misletoe, oats, millet, and other grasses, and void them entire. Squirrels, rats, parrots, and other animals, suffer many of the seeds which they devour to escape, and thus in effect disseminate them. Moles, ants, earth-worms, and other insects, by ploughing up the earth, admit a free passage to those seeds which have been scattered upon its surface. Again, some seeds attach themselves to animals, by means of hooks, crotchets, or hairs, which are

either affixed to the seeds themselves, as hound's tongue, mouse-ear, vervain, carrot, bastard parsley, sanicle, water hemp-agrimony, aretopus and verbesina; to their calyx, as in burdock, agrimony, rhexia, small wild bugloss, dock, nettle, pellitory, and lead-wort; or to their fruit or seed-vessel, as in liquorice, cucumber's nightshade, cross-wort, clivers, French honey-suckle, and arrow-headed grass. 4. The seeds which disperse themselves by an elastic force have that force resident either in their calyx, as in oats and the greater number of ferns; in their pappus, as in centaurea crupina; or in their capsule, as in geranium, herb-bennet, African spirea, fraxinella, horse-tail, balsam, Malabar nut, cucumber, claterrum, and male balsam-apple.

SEMINA, in the animal economy. See ANATOMY, MIDWINTER, and PHYSIOLOGY.

SEMENDRIA, a town of Servia in the north-west of European Turkey, situated on the south side of the Danube. It is defended by an old castle, and was, in remote times, the residence of the kings of Servia. It has been repeatedly taken and retaken by the Turks and their opponents, viz. in 1683 by the Hungarians; in 1690 by the Turks; and again by the Hungarians in 1718, after which it was ceded to the Turks. Inhabitants 9000. Twenty miles south-east of Belgrade, and fifty south of Temesvar.

SEMENTINÆ FERIE, in antiquity, feasts held annually among the Romans, to obtain of the gods a plentiful harvest. They were celebrated in the temple of Tellus, where solemn sacrifices were offered to Tellus and Ceres. These feasts were held about seed-time, usually in the month of January; for, as Macrobius observes, they were moveable feasts.

SEMI ARIANS, in ecclesiastical history, a branch of the ancient Arians, consisting, according to Epiphane, of such as, in appearance, condemned the errors of that heresiarch, but yet acquiesced in some of the principles thereof, only palliating and hiding them under softer and more moderate terms. Though they separated from the Arian faction (see ARIANS), they could never be brought to acknowledge that the Son was *ὁμοουσιος*, that is, consubstantial, or of the same substance with the Father; they would only allow him to be *ὁμοεισιος*, that is, of a like substance with the Father, or similar to the Father in his essence, not by nature, but by a peculiar privilege. The semi-arianism of the moderns consists in their maintaining that the Son was from all eternity begotten by the will of the Father, contrary to the doctrine of the orthodox, who seem to teach that the eternal generation is necessary. Such at least are the respective opinions of Dr. Clarke and bishop Bull. See THEOLOGY.

SEMIAN'NULAR, *adj.* Lat. *semi* and *annulus*, a ring. Half round.

Another boar tusk, somewhat slenderer, and of a semiannular figure. *Grew's Museum.*

SEMITBREE, *n. s.* Fr. *semitreve*.

He takes my hand, and as a still which stays
A semibreve 'twixt each drop, he niggardly,
As loth to enrich me, so tells many a lye. *Downe.*

Semitbreve is a note in music relating to time, and

is the last in augmentation. It is commonly called the master-note, or measure-note, or time-note, as being of a certain determinate measure or length of time by itself; and all the other notes of augmentation and diminution are adjusted to its value.

Harris.

SEMICIRCLE, *n. s.* Lat. *semicirculus*, semi and circle. A half round; part of a circle divided by the diameter.

Black brows

Become some women best, so they be in a *semicircle*
Or a half moon, made with a pen.

Shakspeare.

The firm fixture of thy foot would give an excellent motion to thy gait in a *semicircled* farthingale.

Id.

The rainbow is caused by the rays of the sun falling upon a roid and opposite cloud, whereof some reflected, others refracted, beget the *semicircular* variety we call the rainbow. *Browne's Vulgar Errors.*

The seas are inclosed between the two *semicircular* moles that surround it.

Addison on Italy.

The chains that held my left leg gave me the liberty of walking backwards and forwards in a *semicircle*.

Swift.

SEMICOLON, in grammar, is one of the points or stops used to distinguish the several members of a sentence from each other. The semicolon has its name as being of somewhat less effect than a colon; or as demanding a shorter pause. The proper use of the semicolon is to distinguish the conjunct members of a sentence, i. e. such as contain at least two simple members. Whenever, then, a sentence can be divided into two several members of the same degree, which are again divisible into other simple members, the former are to be separated by a semicolon. For instance: 'If fortune bear great sway over him, who has nicely stated and concerted every circumstance of an affair; we must not commit every thing, without reserve, to fortune, lest she have too great a hold of us.' But though the proper use of the semicolon be to distinguish conjunct members, it is not necessary that all the members divided hereby be conjunct. For, upon dividing a sentence into great and equal parts, if one of them be conjunct, all those other parts of the same degree are to be distinguished by a semicolon. Sometimes also members that are opposite to each other, but relate to the same verb, are separated by a semicolon. Thus Cicero:—Ex hac parte pudor, illinc petulantia; hinc fides, illinc fraudatio; hinc pietas, illinc sceus, &c. To this likewise may be referred such sentences, where, the whole going before, the parts follow: as, 'The parts of oratory are four; invention, disposition, elocution, and pronunciation.'

SEMICUBIUM, in medicine, a half bath, wherein the patient is only placed up to the navel.

SEMI-DIAMETER, *n. s.* Semi and diameter. Half the line which, drawn through the centre of a circle, divides it into two equal parts; a straight line drawn from the circumference to the centre of a circle.

The force of this instrument consists in the disproportion of distance betwixt the *semidiameter* of the cylinder and the *semidiameter* of the rundle with the spokes.

Wilkins.

Their difference is as little considerable as a *semidiameter* of the earth in two measures of the highest heaven, the one taken from the surface of the earth,

the other from its centre: the disproportion is just nothing.

More.

SEMI-DIAPHANEITY, *n. s.* Lat. *semi* and *diaphaneity*. Half transparency; imperfect transparency.

The transparency or *semidiaphaneity* of the superficial corpuscles of bigger bodies may have an interest in the production of their colors.

Boyle on Colours.

Another plate, finely variegated with a *semidiaphanous* grey or sky, yellow and brown.

Woodward on Fossils.

SEMI-FLUID, *n. s.* & *adj.* Semi and fluid. Imperfectly fluid.

Phlegm, or pituite, is a sort of *semifluid*; it being so far solid that one part draws along several other parts adhering to it, which doth not happen in a perfect fluid; and yet no part will draw the whole mass, as happens in a perfect solid.

Arbuthnot.

SEMI-LUNAR, *adj.* Fr. *semilunaire*; Lat. *SEMILUNARY*.

{ *semi* and *luna*. Resembling in form a half moon.

The eyes are guarded with a *semilunar* ridge.

J. A. C.

Grew.

SEMI-METAL, *n. s.* Semi and metal. Half metal; imperfect metal.

Semimetals are metallic fossils, heavy, opaque, of a bright glittering surface, not malleable under the hammer; as quicksilver, antimony, cobalt, the arsenicks, bismuth, zink, with its ore calamine: to these may be added the semimetallick recements, tully and pampholyx.

Hill.

SEMINAL, *adj.* Fr. *seminal*; Lat. *seminis*.
SEMINALITY, *n. s.* { Belonging to seed; contained in the seed; radical: the adverb corresponding: seminary is strictly a seedplot; place where any thing is sown to be transplanted; seminal state; principle; causality; breeding place; place of education: semination is the act of sowing: seminific and seminifical is productive of seed.

It was the seat of the greatest monarchy, and the *seminary* of the greatest men of the world, whilst it was heathen.

Bacon.

Nothing subministrates apter matter to be converted into pestilent *seminaries* sooner than steams of nasty folks and beggars.

Harvey on the Plague.

Seminification is the propagation from the seed or *seminal* parts.

Hale's Origin of Mankind.

Had our senses never presented us with those obvious *seminal* principles of apparent generations we should never have suspected that a plant or animal would have proceeded from such unlikely materials.

Glanville's Seepsis.

As though there were a *seminality* in urine, or that, like the seed, it carried with it the idea of every part, they conceive we behold therein the anatomy of every particle.

Broune.

The hand of God, who first created the earth, hath wisely contrived them in their proper *seminaries*, and where they best maintain the intention of their species.

Id.

We are made to believe that in the fourteenth year males are *seminifical* and pubescent; but he that shall inquire into the generality will rather adhere unto Aristotle.

Id.

Some, at the first transplanting trees out of their *seminaries*, cut them off about an inch from the ground, and plant them like quickset.

Mortimer's Husbandry.

This stratum is expanded, serving for a common

integument, and being the *seminary* or promptuary that furnisheth forth matter for the formation and increment of animal and vegetable bodies. *Woodward.*

Though we cannot prolong the period of a commonwealth beyond the decree of heaven, or the date of its nature, any more than human life beyond the strength of the *seminal* virtue, yet we may manage a sickly constitution, and preserve a strong one. *Swift.*

The inns of court must be the worst instituted *seminaries* in any Christian country. *Id.*

SEMINARY, in Catholic countries, is particularly used for a kind of college or school, where youth are instructed in the ceremonies, &c., of the sacred ministry. Of these there are great numbers; it being ordained by the council of Trent that there be a seminary belonging to each cathedral under the direction of the bishop.

SEMIOPA'COUS, *adj.* Lat. *semi* and *opacus*. Half dark.

Semiopacous bodies are such as, looked upon in an ordinary light, and not held betwixt it and the eye, are not wont to be discriminated from the rest of opacous bodies. *Boyle.*

SEMPALATNOI, a fortress of Asiatic Russia, in the government of Tomsk, built in 1718, with a view of protecting the trade there carried on with the Calmucs and Bucharians. But as the current of the Irtysh, on whose banks it was situated, continually carried away the adjacent ground, it was successively removed to different spots, and is now in its fourth position; the river is here so shallow, and so obstructed, that it has been found impossible to make a passage to the fort. The rendezvous, therefore, made for the purpose of trade with the Kirghisian and Bucharian caravans, has been fixed about ten miles below. The principal fortress forms a square, composed of wooden ramparts, and surrounded by a ditch: two villages stand, one above, and the other below, both palisaded like the fort, and containing about 200 houses. The most profitable trade carried on is with the Kirghises, who give their horses and cattle at a very cheap rate, for mere toys and trifles. It is also frequented by traders from Taschkent and Little Bucharia, who bring chiefly inferior cotton goods. The name of Sempalatnoi, which signifies the Seven Palaces, is derived from some ruins situated in the neighbourhood. Long. 80° 10' E., lat. 50° 29' 45" N.

SEMPALMATI, in ornithology, a subdivision of the order of palmipedes, in Mr. Latham's system, comprehending birds that have only half-webbed feet. See PALMIPEDES.

SEMPIELAGIANS, in ecclesiastical history, a name anciently, and even at this day, given to such as retain some tincture of Pelagianism. See PELAGIANS. Cassian, who had been a deacon of Constantinople, and was afterwards a priest of Marseilles, was the chief of these Semipelagians; whose leading principles were, 1. That God did not dispense his grace to one more than another in consequence of predestination, i. e. an eternal and absolute decree, but was willing to save all men, if they complied with the terms of his gospel. 2. That Christ died for all men. 3. That the grace purchased by Christ, and necessary to salvation, was offered to all men. 4. That man, before he received grace, was capable of faith and holy desires. 5. That man was

born free, and was consequently capable of resisting the influences of grace, or of complying with its suggestion. The Semipelagians were very numerous; and the doctrine of Cassian, though variously explained, was received in the greatest part of the monastic schools in Gaul, whence it spread itself far and wide through the European provinces. As to the Greeks and other eastern Christians, they had embraced the Semipelagian doctrines before Cassian, and still adhere to them. In the sixth century, the controversy between the Semipelagians and the disciples of Augustin prevailed much, and continued to divide the western churches.

SEMPIELLUCID, *adj.* Lat. *semi* and *pellucidus*. Half clear; imperfectly transparent.

A light grey *sempellucid* flint, of much the same complexion with the common Indian agat.

Woodward.
SEMPERSPICUOUS, *adj.* Lat. *semi* and *perspicuous*. Half transparent; imperfectly clear.

One entire massy stone, *semi perspicuous*, and of a pale blue, almost of the colour of some cows' horns. *Grew.*

SEMPERAMIS, in ancient and partly fabulous history, a celebrated queen of Assyria, daughter of the goddess Derceto by a young Assyrian. She was exposed in a desert; but her life was preserved by doves for one whole year, till Simmas, one of the shepherds of Ninus, found her and brought her up as her own child. Semiramis, when grown up, married Menones, the governor of Nineveh, and accompanied him to the siege of Bactria: where, by her advice and prudent directions, she hastened the king's operations, and took the city. These eminent services, together with her uncommon beauty, endeared her to Ninus. The monarch asked her of her husband, and offered him his daughter Sosana in her stead; but Menones, who tenderly loved Semiramis, refused; and, when Ninus had added threats to entreaties, he hanged himself. No sooner was Menones dead than Semiramis, who was of an aspiring soul, married Ninus, by whom she had a son called Ninyas. Ninus was so fond of Semiramis that at her request he resigned the crown, and commanded her to be proclaimed queen and sole empress of Assyria. Of this, however, he had cause to repent: Semiramis put him to death, to establish herself on the throne; and, when she had no enemies to fear at home, she began to repair the capital of her empire, and by her means Babylon became the most superb and magnificent city in the world. She visited every part of her dominions, and left every where immortal monuments of her greatness. To render the roads passable, and communication easy, she hollowed mountains and filled up valleys, and water was conveyed at a great expense by large and convenient aqueducts to barren deserts and unfruitful plains. She was not less distinguished as a warrior: many of the neighbouring nations were conquered. Semiramis has been accused of licentiousness; and some authors have observed that she regularly called the strongest and stoutest men in her army to her arms, and afterwards put them to death, that they might not be living witnesses of her incontinence. Her passion for her

son was also unnatural; and it was this criminal propensity which induced Ninyas to destroy his mother with his own hands. Mythologists say that Semiramis was changed into a dove after death, and received immortal honors in Assyria. It is supposed that she lived about eleven centuries before the Christian era, and that she died in the sixty-second year of her age and the twenty-fifth of her reign. Many fabulous reports have been propagated about Semiramis. See MYTHOLOGY.

SEMI-SPINALIS, in anatomy, the name of two muscles of the back. See ANATOMY, Index.

SEMITERTIAN, *n. s.* Semi and tertian. An ague compounded of a tertian and a quotidian.—Bailey.

The natural product of such a cold moist year are tertians, *semitertians*, and some quartans.

Arbutus on Air.

SEMI-VOWEL, *n. s.* Semi and vowel. A consonant which makes an imperfect sound, or does not demand a total occlusion of the mouth.

When Homer would represent any agreeable object, he makes use of the smoothest vowels and most flowing *semivocals*. *Broome.*

SEMLER (John Solomon), a Lutheran divine, was born in 1725, at Saalfeld in Saxony, and educated under professor Baumgarten at Halle. After quitting the university he resided some time at Saalfeld, whence in 1750 he removed to Coburg, to become editor of the Gazette. In 1751 he obtained the professorship of rhetoric and poetry at Altorf; and two years after that of theology at Halle, where he remained till his death, March 14th, 1791. Semler was one of those divines who, semi-infidel, explain away every thing miraculous in the Gospel history, and of whom Michaelis said, 'Heretofore I was reckoned heterodox by my brethren, but now I am only too orthodox.' The principal works of Semler are *Historiæ Ecclesiasticæ selecta Capitula*, 1767—69, 3 vols., 8vo.; *An Introduction to Exegetic Theology*, 8vo.; *Apparatus ad liberalem N. Test. Interpretationem*, 8vo.; *Apparatus ad lib. V. T. Interpretationem*, 8vo.; he also wrote the history of his own life, published at Halle, 1781, 2 vols. 8vo.

SEMLIN, a town in the frontier district near the confluence of the Save and the Danube, separated from Belgrade by the Save. It is the seat of an arch priest of the Greek church, and the residence of the Austrian commander. It is also the principal place for carrying on the transit trade between Turkey and Slavonia. From the frequent prevalence of the plague, in the neighbourhood of Belgrade, great precautions are necessary to prevent the introduction of infection: all persons coming from Belgrade must undergo a quarantine here. A market is held daily in a meadow between the two towns, where two rows of palisades separate the dealers; sentinels are continually on the watch, to see that no hazardous communication takes place; and all the goods bought from the Turks must be exposed to the air, and fumigated. Inhabitants 3000.

SEMNONES, two ancient nations in Europe: one in Germany, inhabiting the banks of the

Elbe and the Oder; the other in Italy, on the borders of Umbria.

SEMONES, in the Roman mythology, inferior deities, who were not among the number of the twelve great gods. Among these were Janus, Faunus, Pan, Vertumnus, Priapus, Silenus, the Satyrs, and all the illustrious heroes who had received divine honors after death. The word is derived from *semi homines*, i. e. half men, because they were inferior to the gods, though superior to men.

SEMOSANCTUS, a deity of the Romans, one of those called Indigetes, or gods born in their country.

SEMPERVIVE, *n. s.* Lat. *semper* and *vivus*, always alive. A plant.

The greater *sempervive* will put out branches two or three years; but they wrap the root in an oil-cloth once in half a year. *Bacon.*

SEMPERVIVUM, house-leek, in botany, a genus of the dodecagynia order, and dodæandria class of plants; natural order thirteenth, succulentæ: *cal.* divided into twelve parts; the petals are twelve, and the capsules twelve, containing many seeds. Linnaeus enumerates only eight species, but there are twelve, viz., *S. arachnoideum*, *arborescens*, *Canariense*, *glandulosum*, *globiferum*, *glutinosum*, *menanthes*, *montanum*, *sediforme*, *tectorum*, *tortuosum*, and *villosum*. Of these the

S. tectorum alone is a native of Britain. The stalk is about a foot high; the radical leaves are thick, oval, pointed, fringed, and spreading in a rose; those on the stem are imbricated and membranous: the flowers are pale red and sessile, and grow on curved terminal bunches. It is frequent on the tops of houses, and flowers in July. The species is thus described by Lewis: 'The leaves of house-leek, of no remarkable smell, discover to the taste a mild subacid austerity: their expressed juice, of a pale yellowish hue, when filtered, yields on inspissation a deep yellow, tenacious, mucilaginous mass, considerably acidulous and acerb: whence it may be presumed that this herb has some claim to the refrigerant and restraining virtues that have been ascribed to it. The filtered juice, on the addition of an equal quantity of the rectified spirit of wine, forms a light white coagulum, like cream of fine pomatum, of a weak but penetrating taste: this, freed from the fluid part, and exposed to the air, almost totally exhales. From this experiment it is concluded by some that house-leek contains a volatile alkaline salt: but the juice coagulates in the same manner with volatile alkalies themselves, as also with fixed alkalies: acids produce no coagulation.

SEMPITERNAL, *adj.* Fr. *sempiternel*; Lat. *sempiternus*, from *semper* and *æternus*. Eternal in futurity; having no end.

Those, though they suppose the world not to be eternal, à parte ante, are not contented to suppose it to be *sempiternal*, or eternal à parte post; but will carry up the creation of the world to an immense antiquity. *Hale.*

The future eternity or *sempiternity* of the world being admitted, though the eternity à parte ante be denied, there will be a future infinity for the emanation of the divine goodness. *Id.*

Should we the long-depending scale ascend
Of sons and fathers, will it never end?
If 'twill, then must we through the order run
To some one man whose being ne'er begun;
If that one man was *sempiternal*, why
Did he, since independent, ever die? *Blackmore.*

SEMPRONIA; 1. A Roman matron, mother of the Gracchi, celebrated for her learning as well as for her public and private virtues. See **GRACCHUS** and **ROME**. 2. Her daughter, who was married to Scipio Africanus, junior; but is accused of having admitted the triumvirs Carbo, Gracchus, and Flaccus to murder him. No pretence of patriotism can vindicate such crimes.

SEMPRONIUS, the family surname of the Gracchi. See **GRACCHUS**.

SEMSTRESS, *n. s.* Sax. *reamerþne*. A woman whose business is to sew; a woman who lives by her needle.

Two hundred *semstresses* were employed to make me shirts, and linen for bed and table, which they were forced to quilt together in several folds.

Gulliver's Travels.

The tucked up *semstress* walks with hasty strides.
Swift.

SEN'ATE, *n. s.* } *Lat. senatus*; *Fr. senat.*
SEN'ATE-HOUSE, }
SEN'ATOR, } An assembly of counsellors; a body of men set
SENATORIAL, *adj.* } apart to consult for the
SENATORIAN. } public good: a senator is a member of a senate: senatorial, or senatorian, belonging to, or befitting, a senator.

We debase

The nature of our seats, which will in time break ope
The locks o' th' senate, and bring in the crows
To peck the eagles. *Shakspeare. Coriolanus.*

Most unwise patricians,

You grave but reckless *senators*. *Id.*

The nobles in great earnestness are going
All to the *senate-house*; some news is come.

Shakspeare.

When Cæsar would have discharged the *senate*, in regard of a dream of Calphurnia, this man told him he hoped he would not dismiss the *senate* till his wife had dreamed a better dream. *Bacon.*

He had not used excursions, spears, or darts,
But counsel, order, and such aged arts;
Which if our ancestors had not retained,
The *senate's* name our council had not gained.

Denham.

There they shall found
Their government, and their great *senate* chuse.

Milton.

As if to every fop it might belong,
Like *senators*, to censure right or wrong. *Granville.*

Gallus was welcomed to the sacred strand,
The *senate* rising to salute their guest. *Dryden.*

A **SENATE** is an assembly of the principal inhabitants of a state, who have a share in the government.

SENATE, in the university of Cambridge, is equivalent to the convocation of Oxford, and consists of all masters of arts and higher graduates, being masters of arts who have each a voice in every public measure, in granting degrees, in electing members of parliament, a chancellor, &c. &c.

SENATE, CONSERVATIVE, in the last constitution of the ci-devant French republic, was a body of eighty men, who, for a short period, possessed the enormous power of nominating

the whole legislative and executive rulers of the state, yet could not themselves hold any office in either branch of government. It was one of those political engines invented by Buonaparte and his junto, by which he so rapidly accumulated and concentrated the whole power of the republic in himself.

The **SENATE OF ANCIENT ROME** was of all others the most celebrated. It exercised no contentious jurisdiction; but appointed judges, either from among the senators or knights, to determine processes: it also appointed governors of provinces, and disposed of the revenues of the commonwealth, &c. Yet the whole sovereign power did not reside in the senate, since it could not elect magistrates, make laws, or decide of war and peace; in all which cases the senate was obliged to consult the people. The senate, when first instituted by Romulus, consisted of 100 members, to whom he afterwards added the same number, when the Sabines had migrated to Rome. Tarquin I. made the senate consist of 300, and this number remained fixed for a long time; but afterwards it fluctuated greatly, and was increased first to 700, and afterwards to 900, by Julius Cæsar, who filled the senate with men of every rank and order. Under Augustus the senators amounted to 1000, but this number was reduced, and fixed to 600. The place of a senator was bestowed upon merit; the kings had at first the privilege of choosing the members; and, after this expulsion, it was the right of the consuls, till the election of the censors, who from their office seemed most capable of making choice of men whose character was irreproachable, whose morals were pure, and relations honorable. Only particular families were admitted into the senate; and, when the plebeians were permitted to share the honors of the state, it was then required that they should be born of free citizens. It was also required that the candidates should be knights before their admission into the senate. They were to be above the age of twenty-five, and to have previously passed through the inferior offices of quæstor, tribune of the people, ædile, prætor, and consul. The senate always met on the 1st of January for the inauguration of the new consuls; and in all months, universally, there were three days, viz. the kalends, nones, and ides, on which it regularly met; but it met also on extraordinary occasions, when called together by a consul, tribune, or dictator. To render their decrees valid and authentic, a certain number of members was requisite, and such as were absent without some proper cause were fined. In the reign of Augustus 400 senators were requisite to make a senate. Nothing was transacted before sun-rise or after sun-set. In their office the senators were the guardians of religion, they disposed of the provinces, they prorogued the assemblies of the people, they appointed thanksgivings, nominated ambassadors, distributed the public money, and in short had the management of every thing political or civil in the republic, except the creating of magistrates, the enacting of laws, and the declarations of war and peace, which were confined to the assemblies of the people. The senate, as a body,

were styled *Patres conscripti*, 'conscript fathers' See *CONSCRIPT*. Their decrees were published in the name of *Senatus Populusque Romanus*, by contraction, *S. P. Q. R.*, i. e. the Senate and People of Rome. The tribunes of the people could stop their debates and decrees by the word *veto*. Their rank and authority were so great in the time of Pyrrhus that his minister Cineas declared them to be 'a venerable assembly of kings.' But under the emperors who succeeded Augustus they lost their importance, by flattering their vices. At last the senate was abolished by Justinian, thirteen centuries after its institution by Romulus.

A *SENATOR* is properly a member of some senate. The dignity of a Roman senator could not be supported without the possession of 80,000 sesterces, or about £7000 English money; and therefore such as squandered away their money, and reduced their fortune below this sum, were generally struck out of the list of senators. This regulation was not made in the first ages of the republic, when the Romans boasted of their poverty. The senators were not permitted to be of any trade or profession. They were distinguished from the rest of the people by their dress; they wore the laticlave, half boots of a black color, with a crescent or silver buckle in the form of a C; but this last honor was confined to the descendants of those hundred senators who had been elected by Romulus, as the letter C is a contraction for *centum*. See *SENATE*.

SENATOR, in British polity, is a member of either house of parliament. In the laws of king Edward the Confessor, we are told that the Britons called those senators whom the Saxons called afterwards aldermen and borough-masters, though not for their age but their wisdom; for some of them were young men, but very well skilled in the laws. Kenulph, king of the Mercians, granted a charter, which ran thus, viz.:—*Consilio et consensu episcoporum et senatorum gentis sue largitus fuit dicto monasterio, &c.*

SENATUS ACADEMICUS, the title assumed by the professors of the University of Edinburgh, as a learned body, in their diplomas, granted to students.

SENATUS CONSULTUM anciently made part of the Roman law. When any public matter was introduced into the senate, which was always called *referre ad senatum*, any senator whose opinion was asked was permitted to speak about it as long as he pleased, and on that account it was often usual for the senators to protract their speeches till it was too late to determine. When the question was put, they passed to the side of that speaker whose opinion they approved, and a majority of votes was easily collected, without the trouble of counting the numbers. When the majority was known, the matter was determined, and a *senatus consultum* was immediately written by the clerks of the house, at the feet of the chief magistrates, and it was signed by all the principal members of the house. When there was not a sufficient number of members to make a senate, the decision was called *senatus auctoritas*, but it was of no force if it did not afterwards pass into a *senatus consultum*. The sena-

tus consulta were at first in the custody of the kings, and afterward of the consuls, who could suppress or preserve them; but, about A. U. C. 304, they were always deposited in the temple of Ceres, and afterwards in the treasury, by the ediles of the people.

SEND, *v. a. & v. n.* } *Preterite and part.*

SENDER, *n. s.*

} *pass. sent.* Sax. *pen-*
dan; Goth. *senda*; Belg. *zenden*. To despatch persons or things from one place to another; transmit; dismiss; emit; let fly: as a verb active, to despatch a message; require by message: a sender is one who sends.

I pray thee *send* me good speed this day, and shew kindness unto my master. *Gen. xxiv. 12.*

This son of a murderer hath *sent* to take away my head. *Kings.*

I make a decree that all Israel go with thee; forasmuch as thou art *sent* of the king. *Ezra. vii. 14.*

He *sent* letters by post on horseback. *Esther.*

O *send* out thy light and thy truth; let them lead me. *Psalms.*

His citizens *sent* a message after him, saying, We will not have this man to reign over us.

Luke xix. 14.

There have been commissions
Sent down among them, which have flawed the heart
Of all their loyalties. *Shakspeare. Henry V. III.*

I have made bold to *send* in to your wife:

My suit is that she will to Desdemona

Procure me some access. *Id. Othello.*

This was a merry message.

—We hope to make the *sender* blush at it.

Id. Henry V.

The water *sends* forth plants that have no roots,
fixed in the bottom, being almost but leaves.

Bacon's Natural History.

Go with me, some few of you, and see the place;
and then you may *send* for your sick, which bring on
land. *Bacon.*

They could not attempt their perfect reformation
in church and state, till those votes were utterly
abolished; therefore they *sent* the same day again to
the king. *Clarendon.*

My overshadowing spirit and might with thee
I *send* along. *Milton.*

But first, whom shall we *send*
In search of this new world? Here he had need
All circumspection, and we now no less

Choice in our suffrage; for on whom we *send*
The weight of all and our last hope relies. *Id.*

Cherubic songs by night from neighbouring hills
Aërial music *send*. *Id.*

Best with the best, the *sender*, not the *sent*. *Id.*
His wounded men he first *sends* off to shore.

Dryden.

He *sent* for me; and, while I raised his head,
He threw his aged arms about my neck,
And, seeing that I wept, he pressed me close. *Id.*

The senses *send* in only the influxes of material
things, and the imagination and memory present
only their pictures or images, when the objects
themselves are absent. *Cheyne.*

When the fury took her stand on high,
A hiss from all the snaky tire went round:
The dreadful signal all the rocks rebound,
And through the Achaian cities *send* the sound.

Pope.

Servants, *sent* on messages, stay out somewhat
longer than the message requires. *Swift.*

SENECA (Marcus Annæus), a celebrated
orator, born at Corduba, in Spain, but descended

of an equestrian Roman family, which had emigrated with the colony from Rome. He married Helvia, a Spanish lady, by whom he had three sons, Annæus Novatus, Lucius, the philosopher, and Annæus Mela, the father of the poet Lucan. He came to Rome with his family, where he became so eminent as an orator that he was styled declamator, or the rhetorician. He published a collection from the most celebrated orators of that age; part of which is extant, and printed under the title of *Suasoriæ et Controversiæ; cum Declamationum excerptis*.

SENECA (Lucius Annæus), a celebrated Stoic philosopher, the second son of Marcus, born at Corduba, about the beginning of the Christian era. He was removed to Rome in his infancy, where he was educated in the most liberal manner, under the best masters. He learned eloquence from his father; but, his genius rather leading him to philosophy, he put himself under the Stoics Attalus, Sotion, and Papirius Fabianus; three celebrated philosophers, of whom he has made honorable mention in his writings. He also travelled when he was young, as in his *Questiones Naturales* he makes very exact and curious observations upon Egypt and the Nile. But this, though agreeable to his own humor, did not at all correspond with that plan of life which his father had intended for him; who therefore forced him to the bar, and the solicitation of public employments; so that he afterwards became quæstor, prætor, and, as Lipsius says, even consul. In the first year of the reign of Claudius, when Julia, the daughter of Germanicus, was accused of adultery by Messalina, and banished, Seneca was banished too, being charged as one of the adulterers. Corsica was the seat of his exile, where he lived eight years, 'happy in the midst of those things which usually make other people miserable;' and where he wrote his books of consolation, addressed to his mother Helvia, and to his friend Polybius, and perhaps some of those tragedies which go under his name; for he says, '*modo se levioribus studiis ibi oblectasse*.' Agrippina being married to Claudius, upon the death of Messalina, she prevailed with the emperor to recal Seneca from banishment; and afterwards procured him to be tutor to her son Nero, whom she designed for the empire. Afranius Burrhus, a prætorian præfect, was joined with him in this important charge; and these two preceptors, who were entrusted with equal authority, had each his respective department. By the bounty and generosity of his imperial pupil, Seneca acquired that prodigious wealth which rendered him in a manner equal to kings. His houses and walks were the most magnificent in Rome. His villas were innumerable; and he had immense sums of money placed out at interest in almost every part of the world. The historian Dio reports him to have had £250,000 sterling at interest in Britain alone; and reckons his calling it in all at a sum as one of the causes of a war with that nation. All this wealth, however, together with the luxury and effeminacy of a court, does not appear to have had any ill effect upon the temper and disposition of Seneca. He continued abstemious, exact in his manners, and, above all, free

from the vices so commonly prevalent in such places, flattery and ambition. 'I had rather, said he to Nero, 'offend you by speaking the truth, than please you by lying and flattery; *ma-luerim veris offendere, quam placere adulando*. How well he acquitted himself, in quality of preceptor to his prince, may be known from the first five years of Nero's reign, which have always been considered as a perfect pattern of good government; and, if that emperor had but been as observant of his master through the whole course of it as he was at the beginning, he would have been the delight, and not, as he afterwards proved, the curse and detestation of mankind. But when Poppæa and Tigellinus had got the command of his humor, and hurried him into the most extravagant and abominable vices, he soon grew weary of his master, whose life must indeed have been a constant rebuke to him. Seneca, perceiving that his favor declined at court, and that he had many accusers about the prince, who were perpetually whispering in his ear the great riches of Seneca, his magnificent houses and fine gardens, and what a favorite he was grown with the people, made an offer of them all to Nero. Nero refused to accept them; which, however, did not hinder Seneca from changing his way of life; for, as Tacitus relates, 'he kept no more levees, declined the usual civilities which had been paid to him, and under a pretence of indisposition, or some engagement or other, avoided as much as possible appearing in public.' Nero, in the mean time, who had despatched Burrhus by poison, could not be easy till he had rid himself of Seneca also; for Burrhus was the manager of his military concerns, and Seneca conducted his civil affairs. Accordingly he attempted, by means of Cleonicus, a freedman of Seneca, to take him off by poison; but, this not succeeding, he ordered him to be put to death, upon an information that he was privy to Piso's conspiracy against his person. Not that he had any real proof of Seneca's being concerned in this plot, but only that he was glad of any pretence for destroying him. He left Seneca, however, at liberty to choose his manner of dying; who caused his veins to be opened immediately. His wife Paulina, who was very young in comparison of himself, had yet the resolution and affliction to bear him company, and thereupon ordered her veins to be opened at the same time; but Nero gave orders to have her death prevented; upon which her wounds were bound up, and the blood stopped, just in time to save her; though, as Tacitus says, she looked miserably pale and wan all her life after. In the mean time Seneca, finding his death slow and lingering, desired Statius Annæus, his physician, to give him a dose of poison; but, this not having its usual effect, he was carried to a hot bath, where he was at length stifled with the steams. He died, as Lipsius thinks, in the sixty-third or sixty-fourth year of his age, and in about the tenth or eleventh of Nero's reign. Tacitus, on mentioning his death, observes, that, as he entered the bath, he took of the water, and with it sprinkled some of his nearest domestics, saying, 'That he offered those libations to Jupiter the deliverer.' These words are an evident proof that Seneca was not a Christian.

as some have imagined him to have been ; and that the thirteen epistles from Seneca to St. Paul, and from St. Paul to Seneca, are supposititious pieces. His philosophical works are well known. They consist of 124 epistles and distinct treatises ; and, except his books of physical questions, are chiefly of the moral kind, treating of anger, consolation, providence, tranquillity of mind, constancy, clemency, the shortness of life, a happy life, retirement, benefits. He has been justly censured, by Quintilian and other critics, as one of the first corrupters of the Roman style ; but his works are highly valuable, on account of the vast erudition which they discover, and the beautiful moral sentiments which they contain.

SENECA, a county of the United States, westward of Albany, erected from Cayuga county, in 1804. It is bounded by Cayuga county north, east by Cayuga county and lake, south by Tompkins county, and west by Seneca lake. The surface of this county is either quite level, or gently undulated with hill and dale ; though Hector and Ulysses, the two southern townships, are considerably hilly. The soil is principally a calcareous loam, or a well mixed vegetable mould, and in general will suit both grain and grass. Chief towns Waterloo and Ovid.

SENECA, a river of New York, which rises in the former country of the Seneca Indians, runs east and receives the waters of the Seneca and Cayuga lakes ; and afterwards falls into the Onondago, at Three Rivers, fourteen miles above the falls.

SENECA, GUM, properly Senegal gum. See SENEGAL. The consumption of this article in our manufactories is so considerable as to make it an object to find any kind of substitute that is cheaper and that will answer the purpose. In the Repertory, vol. iii., we find the following patent receipt for making a gum, which the inventor recommends under the name of the 'Britannic Elastic Gum,' and which, among a variety of less important uses, is said to be suitable 'for painting, pencilling, and staining silks, calicoes, &c., and in dressing of silk, linen, and cotton, in the loom.' The receipt is, linseed, or nut-oil, one gallon ; bees' wax, one pound ; glue or size, six pounds ; verdigris, four ounces ; and the same of litharge. These he directs to be put into an iron kettle with two quarts of water, and the whole melted down together. Another invention is described in the same work, professedly as a 'substitute for gum, in thickening colors for printing.' The patent was granted to Blakie of Glasgow, in 1788, and he describes his invention in the following words :—'The gum substitute, to thicken colors for calico-printing, and making up or furnishing printers' color-tubs, and which may also be applied to several other uses, is prepared by boiling any quantity of flax-seed in a sufficient quantity of water, until the whole substance be extracted thereby ; and, having strained it through a linen or woollen cloth, again boil down the liquor to the consistence of a jelly. Put it into a close vessel, and, for preservation, put in a little strong spirits, or pour a little sweet-oil on the top of it ; bitters may also be used to preserve it. In using the substitute,

the printer may either put a certain quantity into a gallon of color, according to the nature of it, and the particular kind of work to be done, and regulate himself by trial, as is common in using gum ; or reduce the substitute, by boiling in water to the consistence wanted.'

SENECAI, or SENECE (Anthony Bauderon de), a French poet, born at Maçon, in 1645, was great-grandson of Brice Bauderon, a physician, famed for his Pharmacopœia. He purchased the place of first valet-de-chambre to queen Mary Theresa, wife to Louis XIV. He wrote many novels, satires, and epigrams ; but was most famed for his poem, entitled *Les Travaux d'Apollon*, which is highly praised by Rousseau. He died in 1737.

SENECIO (Sossius), a learned Roman, the intimate friend of Plutarch. He was four times consul. See PLUTARCH.

SENECIO, groundsel, in botany, a genus belonging to the class of syngenesia, and to the order of polygamia superflua ; natural order forty-ninth, compositæ. The receptacle is naked ; the pappus simple : cal. cylindrical and calyculated. The scales are equal and contiguous, so as to seem entire ; those at the base are few, and have their apices or points decayed. There are fifty-seven species. Of these seven are British, viz. :—1. *S. crucifolius*, hoary perennial ragwort ; the corollæ are radiant ; the leaves are pinnatifid, dentated, and downy beneath ; the stem is erect, and two feet high ; the flowers are yellow, and grow in clusters. It is frequent in woods and hedges. 2. *S. jacobæus*, common ragwort ; the corollæ are radiant ; the leaves pinnated and lyre-shaped, and of a dark-green color ; the stalk is erect, round, and generally purplish ; the flowers grow in clusters on the tops of the stalks. The leaves have a bitterish subacid taste, and extremely nauseous. Simon Paulli says that a decoction of them cured many soldiers of an epidemic dysentery. 3. *S. paludosus*, marsh ragwort ; the corollæ are radiant ; the leaves sword-shaped, acutely serrated, and somewhat downy underneath ; the stem is erect, branched towards the top, and four or five feet high ; the flowers are large and yellow. It is frequent in fens and ditches in England. 4. *S. saracenicus*, or sarrasin, broad-leaved ragwort ; the corollæ are radiant ; the leaves are lanceolated, serrated, and somewhat smooth ; the stem is erect, simple, and four or five feet high ; there are several flowers on each foot-stalk, which are yellow, and grow in clusters on the top. It grows in moist pastures in England ; and flowers in July or August. 5. *S. sylvaticus*, or mountain groundsel, has its corollæ revolute, its leaves pinnatifid and dentated, the stem comybus and erect. It flowers in July, and is frequent in woods and heaths. 6. *S. viscosus*, or cotton groundsel, has its corollæ revolute, its leaves pinnatifid, viscid, and downy. The scales of the calyx are lax and hairy, and are of the same length with the perianthium. 7. *S. vulgaris*, the common groundsel, has its corollæ naked ; its leaves sessile, smooth, and sinuated ; their segments short, broad, and minutely serrated ; the flowers are yellow, and without radii. It grows in cultivated ground every where, and flowers in May.

Its leaves have been used in medicine externally as a vulnerary and refrigerant, and internally as a mild emetic; but they have little efficacy.

SENEGAL, a remarkable river of Africa, one of the principal which falls into the sea on its western coast. In early maps of Africa it was laid down as identical with the Niger, and delineated as coming from the most distant regions of the interior. The French, however, having fixed their head settlement at St. Louis, at the mouth of the Senegal, in the beginning of the last century, penetrated up the river as far as Gallam, where they established a fort. Tombuctoo, early celebrated as the centre of African wealth, being situated on the Niger, anxious enquiries were made as to the means of penetrating to that city by the Senegal. It was found, however, that about sixty miles above Gallam the country assumed a mountainous aspect, and the rocks intersected the river in such a manner as to render it impossible for barks to ascend. This was called the cataract of Felu; and about forty leagues higher were the falls of Govinea, which have not been carefully examined, but have been reported as very formidable. These obstacles served to account for the fact, which was soon ascertained, that there was no instance of a vessel sailing between Tombuctoo and Gallam. Still it was conceived that, by transporting goods from the rock of Felu to beyond that of Givonea, the benefit of the navigation of the supposed Niger might be obtained. In endeavouring, however, to trace the higher part of its course, the parties sent were perplexed by various and contradictory reports. According to some the Niger, after passing Tombuctoo, continued to flow westward, till it discharged itself into the Atlantic: others asserted that the river passing Tombuctoo flowed eastward, and had no communication with the Senegal. These last statements appeared so well attested that the learned French geographers, Delisle and D'Anville, hesitated not, in the course of the century, to make an essential change in the geography of this part of Africa, describing the Senegal as a completely distinct river from the Niger. They derived it erroneously, however, from the lake Maberia, which appears to be the same described by Mr. Park, under the name of Dibbe. At this time the persons best acquainted with the French settlement on the Senegal continued to cherish the old ideas, and to hope for a navigable intercourse with Tombuctoo.

The journey of Park, however, clearly ascertained the distinction between the two rivers and the eastward course of the Niger, to which a portion of what even Delisle and D'Anville had assigned to the Senegal belonged. He learned moreover the source of the Senegal, in the great range of mountains which traverses Manding and Jallonkadoo; from the other side of which the Niger takes its rise. Hence indeed descend a succession of rivers, the principal of which, called the Ba Fing, or Black River, is considered as the principal branch of the Senegal. Its source may be fixed pretty nearly in 7° 0' W. long. and 11° 50' N. lat. The Faleme, and the Ba Lee, or Kokoro, are also great streams, which joining

the Senegal, in Gallam, render it a river of the first magnitude. The whole of the early course of this river, and its tributaries, is through a country diversified by rugged and precipitous hills, and intersected by numerous streams, the sands of which, being impregnated with gold dust, afford a considerable source of wealth. The gold is extricated by women, by the mere process of agitation. Having passed Gallam, the Senegal rolls over a level plain, through Foota Torra, the states of the Siratik, and the country of the Foulahs: after passing Podor, about sixty leagues from its mouth, the level is so complete that Adamson does not conceive it to descend more than two feet and a half. The river in this part is bordered with vast woods, filled with numberless species of birds, and all the different kinds of monkeys and parrots in particular. Crocodiles, and other species of amphibia, also abound here, where finally the Senegal separates into branches, which form several large islands. The entrance is obstructed by a formidable bar, or ridge of sand, stretching across it at a little distance under water. It is in lat. 16° 5' N.

There are two principal channels used by vessels, named the great and little passes. The former, though its breadth and direction often vary, is usually 100 fathoms wide, and from nine to thirteen feet deep, but, on account of the swell on it, vessels of eight feet only can pass it with safety, and even the smallest craft requires a pilot, who visits the pass every day; its length is about a mile and a half, and when within it the water becomes perfectly smooth, and the depth increases to four and six fathoms. The little pass is only fit for canoes. The most favorable time for entering the river is from April to June, when the winds blow from the south, and, the water being low, there is little current setting out. The most dangerous time is from September to December, when strong easterly winds and a rapid current cause a heavy surf to break quite across the bar. The river is navigable at all seasons for small vessels to Podor, sixty leagues from the bar, and in the rainy season for vessels of 150 tons to Galam, 200 leagues farther. From the bar the direction of the river is to the north; the western, or right bank, which separates it from the sea, being a narrow strip of sand, only 100 fathoms broad, and devoid of all vegetation. Its extremity is named Barbary Point, from which the bar stretches across to the main.

Four leagues above the bar is the isle St. Louis, the principal establishment of the French in Senegal. It is about a mile and a half long, and no where more than 300 yards broad; it is flat, and without other vegetation than mangroves at the northern extremity, some scattered palms, and some kitchen vegetables raised in gardens. It has no fresh water, and, that of the river being brackish from December to July, during this period the inhabitants are obliged either to send boats for the necessary supply above the reach of the tide, or to content themselves with what they can procure from holes dug in the sand on the shores of the island, but which loses little of its salt. The establishment of St. Louis consists

of a fort, an hospital, a church, about twenty brick houses, and the huts of the negroes. The fort is of an irregular form, consisting of walls of brick, with four round towers and some bastions; the magazines are within the fort. On the west side of the island is a battery of fourteen twenty-four pounders, which commands the strip of sand that separates the river from the sea; another battery of sixteen heavy guns on the south point of the island; a third on the north point of five guns; and a fourth a little north of the town of six eighteen pounders. The population of the island in 1801 was 10,000 persons, of whom 300 only were whites and free people of color, the remainder being slaves. The garrison in time of war ought to consist of 600 Europeans, and of 400 in peace; but these numbers were never complete.

Twenty-five leagues from St. Louis, ascending the Senegal, is *L'Escale de Desert*, on the right bank, a considerable trading place for gum. A little higher up on the opposite bank is a creek, or natural canal, called *Portuguese River*, which communicates with a lake called *Panier Foulah*, into which the waters of the Senegal rush with great rapidity in the rainy season. Sixty leagues above St. Louis is the fort of *Podor* on the left bank, and on the opposite bank below *Podor* the establishment *Du Coq*, and above it the settlement named *Terrier Rouge*; 255 leagues above St. Louis on the left bank is *Galam*, to which the free people of color of St. Louis and *Goree* make an annual voyage on the river, to purchase slaves. The boats, to the number of about forty, leave St. Louis in July, and do not arrive at *Galam* before October. A fair is held here the first fifteen days of November, where are exchanged European goods for gold dust, ivory, bullocks' hides, slaves, rice, millet, and maize, the latter for the provisioning of *Goree* and St. Louis. When the waters of the river begin to fall the boats descend, and arrive at St. Louis in fifteen days. Besides the tedious ascent of the river, and the unhealthiness at this season, which is almost certain destruction to Europeans, the merchants are laid under heavy contributions by the chiefs on the banks. The journey to *Galam* by land, it is said, may be made in twenty-five days with ease, during eight months of the year; but the most favorable season is in April, when the strong north winds moderate the heat.

Under the reign of Louis XIV. the energies of France began first to be directed towards colonies and commerce. When, in 1637, *Jannequin* undertook his voyage to the Senegal, he found no settlement by any European nation, and his party were obliged to erect temporary habitations at the village of *Biyurt*, on the left bank of the river. In 1664 the first West India company, being established at *Dieppe*, directed its operations towards this part of Africa: but it was soon involved in bankruptcy; and several similar companies, which followed in succession, were equally unfortunate. Each, however, at their commencement, made vigorous exertions to promote the trade, of which they had obtained the monopoly; so that the settlement soon acquired prosperity; and St. Louis, the capital of the new settlers, having the great advantage

of a secure situation, began to flourish. The present streets are said to be well arranged.

The chief branch of the commerce of this settlement consists in procuring the gum known by the name of gum Senegal. It has been ascertained, by experiment, that this is much superior to all the eastern kinds, and even to that of Arabia; that it is both more mucilaginous and gummy; that in some arts and trades no other gum can be used as a substitute; in short the use of it has become general within the last half century, it is now sought after with avidity. The acacia forests, from which this substance exudes, are in the track of desert extending northwards from the Senegal, and in the possession of three tribes of Moors, called *Trarshaz*, *Braknaz*, and *Darmanko*, who occupy about seven oases or verdant spots, in that vast tract bounded on the south by the Senegal, on the west by the Atlantic, and on the east and north, which extends indefinitely into the expanse of the *Sehara*. The three great gum forests are called *Sahel*, *Al Fatack*, and *El Hiebar*. The former, producing the white gum, held in highest estimation, is in the possession of the *Trarshaz*; the forest of *Al Fatack* belongs to the *Braknaz*; and that of *El Hiebar* to the *Darmanko*. These two last produce the red gum. 'The gum tree of the Senegal is in general not more than eighteen or twenty feet high, and its circumference seldom exceeds three feet. On the banks of the river, the trees have been observed from twenty-five to twenty-eight feet high; but there the soil is covered with a stratum of vegetable earth, and the trees are also few in number. In general, too, the gum tree of the desert is crooked, and has a rough and irregular appearance; such an appearance is common to all the productions of this tract, which are, as it were, stunted, so that the plants appear rather like bushes than shrubs. The aridity of the soil, and the severity of the winds, are probably the causes of this imperfect growth. The leaves of these trees are alternate, of a dry and dirty green; the branches are thorny at the points where the leaves project, the blossoms are white and very short, the bark is smooth, and of dark green. The period when the trees begin to give out their gum is about the 10th of November, when the great periodical rains have newly ceased. No artificial incision is necessary; for, as soon as the harmattan or hot wind of the desert begins to blow, the drying process is so powerful that the bark cracks in numberless places. The gum then issues out in various forms, but chiefly in drops about the size of a partridge's egg. The tenacity of the substance, however, is such as to prevent the drops from falling to the ground, when they would be in danger of being buried in the sand. They remain attached to the bark, near the spot whence they issued; they are always transparent and brilliant at the part where they are broken off, and, when they have been kept a few moments in the mouth, have all the clearness, limpidity, and transparency of the finest rock crystal. About the beginning of December the Moors of the three tribes quit their residences in the desert, where they leave only the aged, decrepid, and infants, with a few who are ne-

cessary to tend the cattle; all the rest set out in a confused and tumultuous crowd, the kings, princes, and rich men, riding on horses and camels, while the poor march on foot. In twelve days, or a fortnight, each tribe reaches the forest which belongs to it, and on the borders of which it forms an encampment. The harvest continues about six weeks, when the gum, being collected in heaps, is placed on the backs of camels and oxen, for the purpose of being transported to the banks of the Senegal. The camel generally carries from 4 cwt. to 5 cwt.; the ox about 150 lbs.; and the gum is contained in immense leathern sacks, made of tanned ox hides. The great gum fair is at a spot on the northern bank of the Senegal, about mid-way between Podor and Fort St. Louis. There is not in the world a more barren and desolate spot; it is merely an immense plain, formed of white and moving sands; not a herb, plant, or shrub, varies the uniformity of this immense solitude. It does not even afford a drop of potable water, which must be brought from the river, or from the neighbourhood. Hither, at the usual time, the French merchants repair, to wait the arrival of the Moors. On the morning of their approach, there may be heard, even at a great distance, the confused noise of their armies in motion; and, towards noon, this vast and solitary plain appears covered with a multitude of men, women, camels, oxen, and goats, all enveloped in clouds of dust. Some of these animals carry the tents and baggage; on others are placed the women, who may be seen in the act of suckling their children. The kings and chiefs are mounted on beautiful horses, while their wives appear seated on a few chosen camels, elegantly caparisoned, in a kind of baskets covered with an awning. A band of Moors, armed with muskets and lances, escort this ambulatory horde, and vainly attempt to preserve some appearance of order. The air resounds with the voices of men, women, children, and animals; and the living creatures who fill the plain appear truly innumerable. At length, when the whole of this barbarous assemblage is collected, the camps are fixed; a cannon is then fired as a signal for beginning the fair. In carrying on the treaty there is no artifice to which these Moors do not resort; no lies which they do not invent to obtain a higher price for their merchandise; address and threats are alternately employed; and the kings and chiefs invent a hundred lies to extract higher prices, and more considerable presents. The most ridiculous pretensions are every year renewed by these artful savages, who purposely raise innumerable difficulties in the course of the negotiation. Europeans are driven almost distracted by the extreme slowness and apathy of the Moors, who incessantly defer the termination of the business. Between the years 1785 and 1787 the quantity of gum actually bought by the French amounted to 800,000 lbs., independently of 400,000 lbs. carried to Portendick, and sold to the English. It is purchased in kantars, which originally contained about 500 lbs.; but the French, that they might not be behind hand in cheating, gradually increased the size of the kantar, without any observation being made by the Moors, who are

entire strangers to this kind of geometry. The kantar thus amounts now to about 2000 lbs. It is paid almost exclusively in East India cotton cloths, dyed with indigo, called pieces of guinea; each of these is seven or eight ells long, and half an ell broad. Attempts have been made to make them receive cottons of French manufacture; but the Moors immediately distinguish, by the smell, the genuine productions of the East Indies, and will accept of no other. The standard price of the kantar is fifteen pieces of guinea; and as these may be averaged at 25 francs, the original price of the kantar will be 375 francs (15s. 7½d.), which gives the pound of gum at nearly 3 sols, 6 deniers (not quite 2d.). The gum has sold in Europe at from 30 to 40 sols (15d. to 20d.); so that, after ample allowance for freight and charges, the profit must still be very great. The trade might admit of considerable extension, as there are two other forests at Guerouf and Gallani, farther up the Senegal, the gum from which might be procured at a cheaper rate, though with greater expense of transport.—Edinb. Gazetteer.

In 1786, besides gum, there were exported from the Senegal slaves to the number of 2200, valued at 2,640,000 livres; gold to the amount of 90,000 livres; ivory and miscellaneous articles to 130,000 livres. In the war of 1756 this settlement yielded to the victorious arms of Britain, and was ceded to this country at the peace of 1763. The French, however, retook it in 1779, and retained it at the peace of 1783. They lost it again in the revolutionary war; but, on the restoration of the Bourbons, it was again ceded to France. In sailing to resume possession, the *Medusa* frigate sustained that terrible shipwreck which seems to have paralysed all the further attempts to restore the importance of these settlements.

SENEGAMBIA, a name which has been given to those countries of Africa lying between the south limits of the Great Sahara and the mountains of Kong. They are watered by the Gambia, Senegal, and Rio Grande.

On passing from Sahara to the banks of the Senegal, we exchange an ocean of sand for a region of fertility, and the morose and ferocious Moor for the cheerful and placid negro; but the first feeling that springs from the transition is a recollection of that iniquitous traffic which equally degraded the negro and disgraced the European. Though the Senegal is the common line of demarcation, a few Moors are scattered among the negroes on the south of that river, and some negroes are intermixed with the Moors on its northern banks.

The interior of this part of western Africa had scarcely been visited by Europeans, previously to the end of the eighteenth century. The French had long before settled near the mouth of the Senegal, and the English had possessed themselves of the Gambia; but, as their object was trade, their descriptions were confined to the productions and inhabitants of the coast and the banks of the rivers. Since 1790, however, various travels have been undertaken, and several valuable works relative to Senegambia published. The two journeys of Park are well

known; the works of Golberry and Durand have added much to our knowledge of this part of Africa; the accounts published by the African Association have further increased our store of information; and M. Mollien's late travels to the interior, and to the sources of the Senegal and the Gambia, have also disclosed several particulars. For the following brief sketch of the results, we are principally indebted to Dr. Myers.

The coast of this part of Africa is flat and sandy. The heights near Cape Verd, and some sand-hills about the fourteenth parallel, alone break the uniformity, till we reach the southern bank of the river of Sierra Leone, which presents some considerable elevations, in the prolongation of the mountains of the interior. The part of the country near the sea, as far as below 12° lat., is flat and sandy, and altogether free from stones. Eastward of this, for more than 100 miles, the soil is partly sandy, and partly argillaceous, quite smooth, and without stones. This tract ends toward the south on the banks of the river Rio Nunez. The third district, stretching as far as the base of the mountains, exceeds 150 miles in breadth, and terminates at the river Sierra Leone. The soil of this division is argillaceous, hilly, and stony. Beyond the waving line that bounds the eastern part of this district, the country is mountainous for about 10° long., rising in parallel terraces and chains, which increase in altitude as they approach the south, till they attain their greatest elevation between 8° and 10° N. lat. They begin to decline about 7° W. long.; and the declivity appears to be steeper towards the east than the west, and on the southern than the northern side. The extent of this mountainous country towards the south remains to be explored. Having entered the northern part of Fouta Jallo, M. Mollien observes, 'from the summits of these heights, I discovered a considerable tract of country, studded with rocky mountains, whose summits were lost in the clouds, and separated from each other by frightful precipices! Desolation reigned throughout; some meadows, situated at the foot of these steep hills, but partially interrupted the dreary uniformity.' Having reached the top of the mountains of Tangue, about 11° of lat., and a little north of the source of the Gambia, the same traveller remarks, 'the mountains situated at the foot of that on which I stood resembled immense plains covered with a thick fog. The mountains of Tangue are of great elevation, and are crowned by a peak which is frequently concealed in the clouds. In the rainy season the clouds gather round their tops, the thunder is incessantly rolling there, and deluges of rain inundate the country below.' The air was so cold, in these elevated tracts, that this traveller was glad to find a sheltered place exposed to the rays of the sun to rest in. The whole of these elevated regions are said to be metallic, and particularly to abound in gold and iron. The courses of the rivers are often interrupted by ridges of rock which produce cataracts.

From M. Mollien's observations it appears that the sources of the great rivers which issue from the nucleus of African Mountains are

situated a little north-west of Teemboo. Another object which this French traveller was instructed to accomplish, if possible, was to discover the source of the Dialli Bâ, or Niger; but this he was not able to reach. From the inhabitants of Teemboo, however, he learned, that the river was well known by that name, and that its source was situated in the mountains between Kouranco and Soliman. The account places it about eight days' journey south-east of that city. Its distance from Sierra Leone was also stated to be eleven days' journey on foot, which, through such a rugged district, cannot be estimated at much more than fifteen miles a day, which, therefore, makes it 165 miles.—The countries beyond the basins of these rivers we shall consider as belonging to the interior of the continent. This space, which stretches from about 8° to 17° N. lat., and from 5° to 17° W. long., is divided into such a labyrinth of small states that it would be impossible with our present knowledge to describe the boundaries and physical peculiarities of each. The most conspicuous view of this group of kingdoms, countries, and people, will therefore, be exhibited by first specifying a few of the leading distinctions of territory, and then delineating the peculiarities of the different tribes by whom they are inhabited. The most numerous people of these regions are the Jaloffs, or Yaloffs, which the French call the Oualofs. The empire of the Jaloffs was anciently bounded on the north by the Senegal, and on the south by the Gambia, and it stretched from the sea to the Faleme. But this empire has been dismembered, and split into a variety of states, the principal of which are the following:—The kingdom of Brack or Wallo, occupies the north-west corner, and is situated on the south bank of the Senegal, where that river makes its principals weep before it enters the sea. The title of the reigning prince is Brack, and the crown is hereditary; but it is the eldest son of the sovereign's sister who is the legitimate heir.

Cayor is the name of a kingdom extending along the coast, beyond Cape Verd. Between the southern confines of Cayor, and the northern bank of the Gambia, the kingdoms of Baol, Sin, and Burra, border on the coast. Behind the latter that of Badiloo extends along the same bank of the Gambia, till it forms nearly a line with the eastern parts of Baol and Sin. East of these three, stretches the kingdom of Salum, which, from its extent, with the number and civilisation of its inhabitants, is one of the most important of the Senegambian states. East of Salum and Cayor is the extensive kingdom of the Bourb-Jaloffs. In the interior of these lie the kingdoms of Fouta-Toro and Woolli; the former stretching along the southern bank of the Senegal to about 11° W. long.; and the latter along the northern shore of the Gambia.

In the mountainous region, near the sources of the Senegal, spreads the native country of the Mandingoes. Its precise limits are uncertain; but if we may judge from the celebrity of the people, the conquests they have made, the civilisation they have attained, the commercial spirit they have manifested, and the colonies they have

established, the kingdom must have been extensive, and the people powerful. It seems to be bounded on the west by Bambarra, on the north by Fouladoo and on the south by Jallonkadoo. Fouladoo is considered as the native region of the Foulahs, who are now so widely spread through various parts of Western Africa. Their most important and populous kingdom is Fouta-Jallo, a mountainous country near the source of the Gambia. The hilly regions that approach the interior comprise a number of separate states, among which are Bondou, Bambouk, Galam, or Kajaaga, and some others; but their limits, and even their names and situations, become more uncertain as we approach the interior.—South of the Gambia, the Feloops, the Bissagos, and other tribes, are intermixed with the Mandingoes and the Foulahs, as far as the British colony of Sierra Leone.

From the coast the ground rises imperceptibly to the confines of Fouta-Toro, where it becomes level, and forms what may be denominated the first terrace in this part of Africa. Fouta-Toro is one of the most extensive and important kingdoms of Senegambia. The country is watered by several rivers, and much of it is fertile. The land in the vales throughout which the rivers flow has been compared to the richest parts of France. Much of it is cultivated with great care; but the planting of trees is neglected, which gives the country a naked appearance. These cultivated grounds produce good crops of rice, millet, indigo, and tobacco. Various fruits are also grown, and many domestic cattle reared, while lions, panthers, hyænas, and jackals, are very numerous, and elephants are sometimes met with. Ostriches, vultures, Guinea-fowls, pigeons, turtle doves, partridges, paroquets, and several other birds, are common. The heat in this country is often intense, as Fahrenheit's thermometer frequently rises to 96° in the shade. The population is also considerable, and has been estimated at 2,000,000. The inhabitants trade with the Moors on the north, with the Fouta Jalloes on the south, and with Europeans by means of the Senegal. The government of Fouta Toro, a kind of theocratic oligarchy, is virtually exercised by seven chiefs, each of whom possesses a part of the country, and all appear to be descendants of the original nation. These seven choose an almayy, or iman, from the common Maraboos, who is the nominal sovereign. All the acts of government are performed in his name, but he cannot take any step without consulting the council, formed of the seven electors. When they are not satisfied with the conduct of the almayy they retire during the night to an elevated spot, and deliberate on the choice of another, and, having fixed upon one, they desire attendance, and address him, saying, 'We have chosen thee to govern our country with wisdom.' He is then brought to the people, who are addressed by one of the chiefs, saying, 'Here is your king, obey him.' The people applaud the choice, salute the new king by discharging muskets, and the former almayy returns to the class of private citizens. So precarious, however, is the sovereign power, that they had no less than three successive almayies in 1818.

Bondou, which lies in the east of Fouta Toro, is of an elongated form, and is little more than a vast forest, much of which is either covered with hills or stones. Springs are common, and the lands, where free from stones and woods, are fertile. The soil near the banks of the Falemé is rich, but the drought is such as only to admit of cultivation in the rainy season. The western parts of the kingdom contain iron, the eastern gold. Where it is cultivated, cotton, maize, millet, indigo, and tobacco, are grown. Wild beasts and game are plentiful, and afford the hunter a rich booty. The crown of Bondou is elective in the king's family, and the brother of the late king, when there is one, is usually preferred. The government is despotic.

Bambouk, which has always been considered the Peru of Africa, joins Bondou on the east. It is a country of mountains, which serve as a defence against the inhabitants of Bondou and Bambarra, by whom its gold has always been considered a tempting prize. Nor have the contiguous people been the only rapacious enemies with whom the Bamboukians have had to contend; for the ruins of the forts erected by the Portuguese show that their zeal for the possession of this precious metal had early led them to the conquest of this distant region, but which they were long since obliged to abandon. The gold is generally found in conical hills of moderate elevation, mixed with earth and other substances, from which it is separated by the simple process of washing. Notwithstanding the imperfect manner in which these mines are worked, the quantity of gold obtained in Bambouk must be very great, as not only most of that which is brought down the Senegal and the Gambia is originally procured there, but much is carried to the east, and afterwards across the desert to Northern Africa and Egypt. Very malleable iron also abounds in this mountainous country, but want of skill in the working renders the quantity obtained comparatively small. Some parts of Bambouk are excessively hot; yet the mountainous nature of the country gives rise to numerous springs which diffuse a partial freshness through the atmosphere, and favor the growth of vegetation. Many of the valleys, therefore, produce rice, millet, peas, and other vegetables; while the baobab and the tamarind tree are very common. Herds of goats and horned cattle are kept in most parts of the country.

Galam, which lies between Bambouk and the Senegal, is esteemed one of the most fertile in Africa; millet, cotton, rice, maize, tobacco, and indigo, grow in great plenty; while milk, flesh, and fish, form a great part of the food of the inhabitants. Cameleopards, lions, and wild boars of large size, abound in the forests; and the hippopotamus and crocodile, with abundance of fish, stock the Senegal and its tributary streams. Large trees also shade the banks of many of these rivers.

Fouta-Jallo spreads over the hilly region south of Bondou, where the great rivers of this part of Africa take their rise. It is a mountainous country, and the ranges by which it is intersected are considered as the branches of a

more lofty chain, situated south-east; the elevated summits of which, the negroes say, are constantly covered with a white hat. If this representation be correct, the mountains of Kong, to which it refers, and which are situated about 10° lat., in the hottest part of the globe, must be very elevated. The soil of the valleys in Fouta Jallo is a rich mould which the torrents have washed from the mountains, and, being watered by numerous streams, is rendered very productive. Rice and maize are cultivated. The orange, the banana, and the papaw tree abound; but the immense baobab, the queen of the forest, is not met with, though other trees of large growth form almost impenetrable woods. The climate and temperature of Fouta Jallo are subject to great variation. In the valleys the heat is often intense, while the elevation of some of the mountains exposes the traveller to the sensation of severe cold, though it does not cause that depression of the thermometer which would produce the same feeling in colder climates. Teembo, or Timbo, is the capital of this country, and is esteemed one of the largest cities in this part of Africa, where scarcely any thing but villages, composed of a few huts, are to be met with. It is situated at the foot of a high mountain, and is supposed to contain about 9000 or 10,000 inhabitants. It has a spacious mosque and three forts, one of which contains the king's palace, which is composed of five or six large huts. The fortifications of the town are of earth, and in some places have loop holes; but when M. Mollien was there, in 1818, they were falling into decay. He thinks Teembo an ancient place, as all the country round it bears the name. Though the houses are only huts, they are built with taste, and many of them have courts planted with papaw and banana trees. According to the same traveller, Tenda Maie is a small country enclosed by a bend of the Rio Grande, west of Fouta Jallo, not yet mentioned by any geographer. It is a flat fertile tract, though in some places sandy. The rains do not last so long by a month as among the hills of Fouta Jallo. It produces millet, maize, rice, and cattle. Deer and wild cattle are also to be seen; but the elephant is not found, and beasts of prey are rarely met with. Many valuable woods grow in the forests, and iron is obtained, which is in much request among the neighbouring nations. The inhabitants are a mixture of Mahometans and Pagans.

The Jaloffs, or Oualoffs, which have also been called Yaloffs, occupy the greatest part of the country between the lower parts of the Senegal and the Gambia. M. Golberry estimates the extent of their territory at 4800 square leagues. They are considered as the handsomest negroes in this part of Africa. Their color is a bright black, their hair woolly, their noses flat, and lips protuberant, but less so than in the Mandingoes. Their features, however, are regular, and their physiognomy open and agreeable. They consider themselves the most ancient inhabitants of these regions, and were formerly all subject to one empire, called the Bourb-Jaloff, which still occupies a large tract of country in the interior. The Jaloffs are professed Mahometans, but the doctrines and precepts of the Koran are inter-

mixed with the superstitious practices of their ancient paganism. The number of pagans among them is still great, the religion of whom is pure fetishism. A tree, a stone, a serpent, a ram's-horn, or a scrap of paper covered with Arabic characters, or any other figures, are equally deities to them. Their language is superior to that of their neighbours; but, like them, they have no written characters. They reckon by five figures only, instead of ten, as in our mode of notation, and all their computations are performed by the motions of the fingers. They are great hunters, and excel in the number and management of their horses. They are also reputed to be courageous warriors when engaged with negroes, but pusillanimous in opposition to the Moors. The Jaloffs are not entirely destitute of manufactures, though these are still in their infancy among all the African nations. Some few metallic articles and domestic utensils are made, and the Jaloffs surpass most of the others in manufacturing and dyeing cotton; but, as among the other negroes, necessity and industry are correlative terms. As they find dexterity more congenial than laborious exertion, it is much practised, and those who reside in the neighbourhood of European settlements are considered as accomplished thieves.

The Feloops are spread over a wide space on the south of the Gambia. Their country is extensive, and being a low tract, produces rice and other kinds of grain, where properly cultivated. They have also plenty of goats and poultry, with which they supply European traders that touch at the coast. They are described as a wild unsocial race, speaking a peculiar language, which few Europeans understand. They have abundance of honey, of which they make an intoxicating liquor like mead. They appear to be complete Pagans.

SENESCENCE, *n. s.* Lat. *senesco*. The state of growing old; decay by time.

The earth and all things will continue in the state wherein they now are, without the least *senescence* or decay; without jarring, disorder, or invasion of one another. *Woodward.*

SENESCHAL, *n. s.* Fr. *seneschal*. See its etymology below. One who had in great houses the care of feasts or domestic ceremonies.

John earl of Huntingdon, under his seal of arms, made Sir John Arundel of Trerice, *seneschal* of his household, as well in peace as in war.

Carew's Survey of Cornwall.

Marshall'd feast,
Served up in hall with sewers and *seneschals*,
The skill of artifice, or office, mean!

Milton's Paradise Lost.

The *seneschal* rebuked in haste withdrew;
With equal haste a menial train pursue.

Pope's Odyssey.

SENESCHAL (*seneschallus*), derived from the German *seim*, a house or place, and *scale*, an officer, is a steward, and signifies one who has the dispensing of justice in some particular cases: as the high *seneschal* or steward of England; *seneschal de la hotel de roi*, 'steward of the king's household, *seneschal*, or steward of courts,' &c.—Co. Lit. 61. Kitch. 83. See **STEWARD**. This is the most ancient of all the

titles or dignities which were attached to those individuals that undertook the command of armies, when the kings of France, belonging to the second race, ceased to go in person. The seneschal was selected by the sovereign from among those vassals and subjects who were highest in nobility, and were most distinguished for their rank, wealth, and talents. The title of grand seneschal of France was first created by Lotharius, in 928, and conferred upon Geoffrey, count of Anjou, surnamed Grisegonnelle. This rank or situation continued to be attached to the count of Anjou, until the reign of Philip Augustus, in whom it was extinguished, when he ascended the throne of France in 1121. The grand seneschal likewise exercised the functions of lord steward of the king's household; having under him several subordinate seneschals, who also held places of considerable trust. These were called seneschaux de France, seneschals of France.

SEÑILE, *adj.* Lat. *senilis*. Belonging to old age; consequent on old age.

My green youth made me very unripe for a task of that nature, whose difficulty requires that it should be handled by a person in whom nature, education, and time, have happily matched a *senile* maturity of judgment with youthful vigor of fancy.

Boyle on Colours.

SENIOR, *n. s.* } Lat. *senior*. One older
SENIORITY. } than other; one who, on account of longer time, has some superiority: the state or honor of a senior; eldership.

How can you admit your *seniors* to the examination or allowing of them, not only being inferior in office and calling, but in gifts also. *Whitgift.*

A *senior* of the place replies,
Well read, and curious of antiquities. *Dryden.*

As in insurrections the ringleader is looked on with a peculiar severity, so, in this case, the first provoker has, by his *seniority* and primogeniture, a double portion of the guilt.

Government of the Tongue.

He was the elder brother, and Ulysses might be consigned to his care by the right due to his *seniority*.
Broom.

SENLIS, an old town in the department of the Oise, France, situated on a rising ground, in the middle of an extensive forest, near the Nonette. Its streets are narrow and the houses ill-built; the cathedral is, however, admired. Senlis has some trade in corn, wine, and wood, and manufactures on a small scale of cotton, coarse woollens, paper, lace, and porcelain. Its quarries afford good stone. Here are two great yearly fairs, one in April, the other in October. Inhabitants 4300. Thirty miles north of Paris.

SENN, a kind of itinerant cow-keeper in Switzerland, particularly in the canton of Appenzell. These men do not grow so much hay themselves as they require for their cattle during the winter season, and some of them have no grass lands at all. To supply this deficiency, they employ agents throughout the canton, who are to inform them where good hay may be obtained, which farmers made in favorable weather, &c., and then the senn, or the great cow-keeper, who is in want of fodder, makes his agreements for the winter with the wealthier farmers, to whom he successively drives his cattle as soon

as they return from grass. Thus the itinerant senn, with his cows, often visits five different places during the winter season. He who sells the hay furnishes the senn not only with stabling for his beasts, but boards and lodges him as well as his whole family. In return, the senn, besides paying the stipulated price for the hay, allows to his host as much milk, whey, and zieger (a kind of lean cheese), as may be used in the house, and leaves him also the manure of his cows. In the middle of April, when nature revives, the senn again issues forth with his herd to the meadows and fertile Alps, which he rents for the summer. Thus the life of these men is constant migration, affording the most pleasing variety, and blessing them with health, content, and cheerfulness; but they had not been then cursed with French fraternity. Fine cattle are the pride of the cow-keeper who inhabits the Alps; but, not satisfied with their natural beauty, he will likewise please his vanity. He adorns his best cows with large bells suspended from broad thongs; and the expense in such bells is carried even to a luxurious excess. Every senn has an harmonious set of at least two or three bells, chiming in with the famous *ranz des vaches*, or song of the cow-herds. The Tyrolese bring bells of all sizes to every fair kept in the canton of Appenzell. They are fixed to a broad strap, neatly pinked, cut out, and embroidered; which is fastened round the cow's neck by a large buckle. A bell of the largest size measures upwards of a foot in diameter, is of a uniform width at top, swells out in the middle, and tapers towards the end. It costs from forty to fifty guilders; and the whole peal of bells, including the thongs, will sometimes be worth 140 or 150 guilders; while the whole apparel of the senn himself, when best attired, does not amount to the price of twenty guilders. The finest black cow is adorned with the largest bell, and those next in appearance have two smaller. These ornaments, however, are not worn every day, but only on solemn occasions; viz. when in the spring they are driven up the Alps, or removed from one pasture to another; or when they descend in the autumn, or travel in the winter, to the different farms where their owner has contracted for hay. On such days, the senn, even in the depth of winter, appears dressed in a fine white shirt, of which the sleeves are rolled up above the elbow; neatly embroidered red braces keep up his yellow linen trousers, which reach down to the shoes; a small leather cap or hat covers his head, and a new milk bowl of wood, skilfully carved, hangs across the left shoulder. Thus arrayed, the senn precedes, singing the *ranz des vaches*, and followed by three or four fine goats; next comes the handsomest cow with the great bell; then the two other cows with smaller bells; and these are succeeded by the rest of the cattle walking one after another, and having in their rear the bull with a one-legged milking-stool hanging on his horns; the procession is closed by a trianeu, or sledge, on which are placed the implements for the dairy. It is surprising to see how proud and pleased the cows stalk forth when ornamented with their bells. Who would imagine that even these animals are

sensible of their rank, nay, touched with vanity and jealousy! If the leading cow, who hitherto bore the largest bell, be deprived of her honors, she very plainly manifests her grief at the disgrace, by lowing incessantly, abstaining from food, and growing lean. The happy rival, on whom the distinguishing badge of superiority has devolved, experiences her marked vengeance, and is butted, wounded, and persecuted by her in the most furious manner; until the former either recovers her bell, or is entirely removed from the herd. However singular this phenomenon may appear, it is placed beyond all doubt by the concurring testimony of centuries. The cows, when dispersed on the Alps, are brought together by the voice of the senn, who is then said to allure them (locken). How well the cattle distinguish the note of their keeper, appears from the circumstance of their hastening to him, though at a great distance, whenever he begins to hum the *ranz des vaches*. He furnishes that cow which is wont to stray farthest with a small bell, and knows by her arrival that all the rest are assembled.

SENNA, *n. s.* Lat. *sena*. A physical tree.

What rhubarb; *senna*, or what purgative drug, Would scour these English hence.

Shakspeare. Macbeth.

Senna tree is of two sorts; the bastard *senna*, and the scorpion *senna*; both which yield a pleasant leaf and flower.

Mortimer.

SENNA is the leaf of the cassia senna of Linnaeus. See CASSIA. It appears to have been cultivated in England, in the time of Parkinson (1640); and Miller tells us that, by keeping these plants in a hot-bed all the summer, he frequently had them in flower; but adds, it is very rarely that they perfect their seeds in England. Senna, which is in common use as a purgative, was first known to the Arabian physicians Serapion and Mesue; the first among the Greeks who takes any notice of it is Actuarius, but he only speaks of the fruit not of the leaves. To remove the disagreeable taste of this medicine, Dr. Cullen recommends coriander seeds; and, for preventing the griping with which it is sometimes attended, he thinks the warmest aromatics, as cardamoms or ginger, would be more effectual.

SENNA, ITALICA, or blunt-leaved senna, is a variety of the Alexandrian species; which, by its cultivation in the south of France (late Provence), has been found to assume this change. It is less purgative than the pointed-leaved senna, and is therefore to be given in larger doses. It was employed as a cathartic by Dr. Wright at Jamaica, where it grows on the sandbanks near the sea.

SENNAAR, an extensive country of the ancient Abyssinia, on the southern borders of Nubia, appears to be contiguous to both Abyssinia and Kordofan. Where the soil is overflowed by the Nile it is extremely fertile, and produces abundant crops of dhourra, the principal food of the inhabitants. Wheat and rice are also grown in small quantities. Though rich in vegetable products, and contributing so largely to the support of both man and beast, the soil of this country is said to be singularly unfavorable to their propagation. This Mr.

Bruce ascribes to some noxious quality in the earth. Most of it is impregnated with a species of salt, which is extracted in great quantities in various parts of the country, particularly at Holfaia.

Sennaar has to boast of an excellent breed of horses, praised alike for their size, strength, movements, and general symmetry, their capability of enduring fatigue, and their docility of temper. The town of Sennaar stands on the bank of the Nile, and is described as very populous, and containing many good houses, at least in comparison with the other places. They are all built of clay with a little straw intermixed. Poncet says in his time they had only one story; but now all the principal have two, and parapet roofs, though in most other regions within the influence of the tropical rains the roofs are conical.

Sennaar is a place of considerable trade. Caravans travel in various directions, to Egypt, to Souakin, on the shores of the Red Sea, to Darfur, and other places in the interior. Commerce is indeed the very life of society, and there is not a single family which is not more or less connected with some branch of trade.

The people of Berber, Shendy, and Sennaar, appear to be traders in the strictest sense of the term. Their dress is extremely simple. A long shirt of blue Surat cloth, called marowty, covers them from the lower part of the neck down to the feet; the neck itself is left open, which alone distinguishes the dress of the men from that of the women, who button this shirt round the neck. The men sometimes tie a sash round the middle; and respectable people of both sexes go through the house barefooted. The apartments, particularly those of the females, have the floor covered with Persian carpets. In going out they wear sandals, and a kind of wooden patten, ornamented with shells. With a view to coolness, they have buckets of water thrown upon them in the middle of the day; and, in order to preserve themselves from cutaneous eruptions, of which they entertain a great dread, they anoint themselves daily with camel's grease mixed with civet; and for the same reason, though they put on every day a clean shirt, they lie all night upon one dipt in grease, which forms their only covering. The couch itself is made generally of a tanned bull's hide, much softened by this constant greasing, which occasions a smell from which nothing can free them. The principal diet of the poor consists of bread and flour made of millet. The rich make it into a pudding toasted before the fire, with milk and butter; besides which they eat beef, partly roasted and partly raw. Their horned cattle are the largest and fattest in the world; but camel's flesh is the meat chiefly sold in the market. The liver of the animal and the spare-rib are eaten raw. Hog's flesh is not sold in the market, but is eaten publicly by the people at large, and secretly by those who pretend to be Mahometans. The prevalent diseases are the dysentery and the bloody flux, frequently accompanied by intermitting fever, for which bark is found a sovereign cure. Epilepsies and schirrous livers are likewise very frequent. Those who live much in

camps, or in quarters distant from rivers, have more or less the gravel, occasioned probably by the use of well water; but at Sennaar this malady is rare. The elephantiasis is not known, nor is the small pox endemic.

The commerce of Sennaar consists chiefly in exchanging the productions of interior Africa with those of Egypt and Arabia. The most extensive communication is with Suakin and Jidda, by Shendi, and across the track extending from the Nile to the Red Sea. With Egypt the intercourse is conducted by two different routes. One leads along the east of the Nile, and follows the course of that river to Shendi, when the caravans strike across the vast deserts of Nubia. The other track is west of the Nile. The caravans here, in coming from Egypt, quit the Nile at Siout, then strike across the equally extensive desert to the west of that river. They refresh themselves at Charje or the Great Oasis, then proceed for some time by the same track as the caravans to Darfur, till they rejoin the Nile at Moscho, in the territory of Dangola. After passing through the capital of that kingdom, they come to Korti, where they proceed across the desert of Bahiouda, and, joining the Nile at Derri, follow its course to Sennaar. The commodities drawn from interior Africa, for export to Egypt and Arabia, are gold dust, called tibbar, ivory, civet, rhinoceros' horns, but, above all, slaves. The gold still maintains its reputation as the purest and best in Africa. The foreign commodity chiefly sought after is blue cloth from Surat. They receive also spices, hardware, and toys, particularly a kind of black beads made at Venice.

In the early ages of Christianity this country, like Abyssinia, underwent a nominal conversion. The greater part of the inhabitants are now Mahometans however; but practise Pagan as well as Christian rites. The government is an absolute monarchy, founded as late as the sixteenth century by a body of Shilluk negroes. On the accession of a new king, all his brothers who can be found are almost invariably put to death: no female is allowed to reign, and the princesses, who are very numerous, meet with little more respect than their female attendants. This absolute power, however, is tempered by an extraordinary limitation, which is, that the king may lawfully be put to death by a council of the great officers, whenever they choose to decide that his reign is no longer for the benefit of the public. The execution of the sentence is entrusted to an officer called the sid-el-koom, who is a member of the monarch's own family, and master of his household. The fact appears to be, that the hereditary kings have sunk into a species of pageants, kept up merely to amuse the people, and that the real power is now in the hands of the chief officers, civil and military. The troops stationed immediately around the capital consist of about 14,000, of a race of negroes called Nuba, from which is derived the general name of Nubia. The infantry are armed with a short javelin and a round shield, and appear to be by no means good troops; but the horse amounting to 1800, though armed only with coats of mail and a broad Slavonian

sword, appeared to Mr. Bruce equal to any he had seen. Sennaar, has three tributary governments: Kordofan, situated between Sennaar and Darfur, to which latter country it is occasionally subjected; Fazuelo, to the south, a mountainous territory, affording a large supply of gold and slaves, the staples of interior Africa. The government of Sennaar, on conquering this territory, continued its mek or sovereign in the capacity of governor. The third government is that of El Acie, or Alleis, on the Bahr el Abiad, including the original country of the Shilluk tribes. The inhabitants are fishermen, and possess a vast number of boats, with large fleets of which they made their invasion in 1504, and possessed themselves of this sovereignty.

Mr. Bruce, who passed through this country in his return from Abyssinia, gives a list of twenty kings who have reigned in it since its conquest by the Shilluks, and of the remarkable custom by which the king ascends the throne with the expectation of being murdered, whenever the general council of the nation thinks proper. The dreadful office of executioner belongs to a single officer, he says, styled, in the language of the country, Sid-el-Coom; and who is always a relation of the monarch himself. It was from his registers that Mr. Bruce took the list of the kings already mentioned, with the number of years they reigned, and which may therefore be received as authentic. The Sid-el-Coom in office at the time that Mr. Bruce visited this country was named Achmet, and was one of his best friends. He had murdered the late king, with three of his sons, one of whom was an infant at its mother's breast; he was also in daily expectation of performing the same office to the reigning sovereign. He was by no means reserved concerning the nature of his office. When asked by Mr. Bruce why he murdered the king's young son in his father's presence? he answered that he did it from a principle of duty to the king himself, who had a right to see his son killed in a lawful and regular manner, which was by cutting his throat with a sword, and not in a more painful or ignominious way, which the malice of his enemies might possibly have inflicted. The king, he said, was very little concerned at the sight of his son's death, but he was so very unwilling to die himself that he often pressed the executioner to let him escape; but, finding his entreaties ineffectual, he submitted at last without resistance. On being asked whether he was not afraid of coming into the presence of the king, considering the office he might possibly have to perform? he replied that he was not in the least afraid on this account; that it was his duty to be with the king every morning, and very late in the evening; that the king knew he would have no hand in promoting his death; but that, when the matter was absolutely determined, the rest was only an affair of decency; and it would undoubtedly be his own choice rather to fall by the hand of his own relation in private than by a hired assassin, an Arab, or a Christian slave, in sight of the populace. On the death of any of the sovereigns of this country, his eldest son succeeds; on which as many of his brothers as can be found are apprehended,

and put to death by the Sid-el-Coom. Women are excluded from the sovereignty here as well as in Abyssinia. The princesses of Sennaar, however, are worse off than those of Abyssinia, having no settled income, nor being treated in any degree better than the daughters of private persons. The king is obliged, once in his lifetime, to plough and sow a piece of ground, whence he is named Baady, the 'countryman or peasant,' a title as common among the monarchs of Sennaar as Cæsar was among the Romans. The royal family marry Arab women; the white color of the mother is communicated to the child. This, we are told by Mr. Bruce, is invariably the case when a negro man of Sennaar marries an Arab woman; and it holds equally good when an Arab man marries a negro woman; and he likewise informs us that he never saw one black Arab all the time that he was at Sennaar. The soil and climate of this country is extremely unfavorable both to man and beast. The men are strong and remarkable for their size, but short-lived; and there is such a mortality among the children that, were it not for a constant importation of slaves, the metropolis would be depopulated. The shortness of their lives, however, may perhaps be accounted for, from their indulging themselves from their infancy in every kind of excess. No horse, mule, nor ass, will live at Sennaar, or for many miles round it. The case is the same with bullocks, sheep, dogs, cats, and poultry; all of them must go to the sands every half year. Bruce assures us this is the case every where about the metropolis of this country, where the soil is a fat earth during the first season of the rains. Two greyhounds which he brought along with him from Atbara, and the mules he brought from Abyssinia, lived only a few weeks after their arrival at Sennaar. Several of the kings of Sennaar have tried to keep lions, but it was almost found impossible to preserve them alive after the rains. They will live, however, as well as other quadrupeds, in the sands, at no great distance from the capital. No species of tree, except the lemon, flowers near this city. In other parts the soil of Sennaar is exceedingly fertile, being said to yield 300 fold.

About twelve miles to the north-west of Sennaar is a collection of villages named Shaddly, from a great saint of that name who constructed several granaries here. These granaries are large pits dug in the ground, and well plastered in the inside with clay, then filled with grain when it is at its lowest price, and afterwards covered up and plastered again at top: these pits they call matamores. On any prospect of dearth they are opened, and the corn sold to the people. About twenty-five miles north of Shaddly there is another set of granaries named Wed-Aboud, still greater than Shaddly; and upon these two the subsistence of the Arabs principally depends: for as these people are at continual war with each other, and direct their fury rather against the crops than the persons of their enemies, the whole of them would be unavoidably starved, were it not for this extraordinary resource. Small villages of soldiers are scattered up and down this country to guard the grain after it is sown,

which is only that species of millet named dora. There are great hollows made in the earth at proper distances throughout the country, which fill with water in the rainy season, and are afterwards of great use to the Arabs as they pass from the cultivated parts of the sands. The fly, which is such a dreadful enemy to the cattle, is never seen to the northward of Shaddly. To the west of these granaries the country is quite full of trees as far as the river Abiad, or El-aice. In this extensive plain there are two ridges of mountains, one called Jebbel Moira, or the Mountain of Water; the other Jibbel Segud, or the Cold Mountain. Both enjoy a fine climate, and serve for a protection to the farms about Shaddly and Aboud already mentioned. Here also are fortresses placed in the way of the Arabs, which oblige them to pay tribute in their flight from the cultivated country, during the rains, to the dry lands of Atbara. Each of these districts is governed by the descendants of their ancient and native princes, who long resisted all the power of the Arabs. Sacrifices of a horrid nature are said to have been offered up on these mountains till about the year 1554, when one of the kings of Sennaar besieged first one and then the other of the princes in their mountains; and, having forced them to surrender, he fastened a chain of gold to each of their ears, exposed them in the market-place at Sennaar, and sold them for slaves at less than a farthing each. Soon after this they were circumcised, converted to the Mahometan religion, and restored to their kingdom. 'Nothing,' says Mr. Bruce, 'is more pleasant, than the country around Sennaar in the end of August and beginning of September. The grain, being now sprung up, makes the whole of this immense plain appear a level green land, interspersed with great lakes of water, and ornamented at certain intervals, with groups of villages; the conical tops of the houses presenting at a distance the appearance of small encampments. Through this very extensive plain winds the Nile, a delightful river there, above a mile broad, full to the very brim, but never overflowing. Every where on these banks are seen herds of the most beautiful cattle of various kinds. The banks of the Nile about Sennaar resemble the pleasantest part of Holland in summer: but soon after, when the rains cease, and the sun exerts its utmost influence, the dora begins to ripen, the leaves to turn yellow and to rot, the lakes to putrefy, smell, become full of vermin, and all its beauty suddenly disappears: bare scorched Nubia returns, and all its terrors of poisonous winds and moving sands, glowing and ventilated with sultry blasts, which are followed by a troop of terrible attendants; epilepsies, apoplexies, violent fevers, obstinate agues, and lingering painful dysenteries, still more obstinate and mortal. War and treason seem to be the only employments of this horrid people, whom Heaven has separated by almost impassable deserts from the rest of mankind; confining them to an accursed spot, seemingly to give them an earnest in time of the only other curse which he has reserved to them for an eternal hereafter.'

With regard to the climate of the country round Sennaar, Mr. Bruce has several very curious obser-

uations. The thermometer rises in the shade to 119° ; but the degree indicated by this instrument does not at all correspond with the sensations occasioned by it, nor with the color of the people who live under it. 'Nations of blacks,' says he, 'live within lat. 13° and 14° ; about 10° south of them, nearly under the line, all the people are white, as we had an opportunity of observing daily in the Galla Sennaar, which is in lat. 13° , and is hotter by the thermometer 50° , when the sun is most distant from it, than Gondar, which is a degree farther south when the sun is vertical. At Sennaar, from 70° to 78° of Fahrenheit's thermometer is cool; from 79° to 92° temperate; at 92° begins warmth. Although the degree of the thermometer marks a greater heat than is felt by us strangers, the sensations of the natives bear still a less proportion to that degree than ours. On the 2nd of August, while I was lying perfectly enervated on a carpet in a room deluged with water at twelve o'clock, the thermometer at 116° , I saw several black laborers pulling down a house, working with great vigor, without any symptoms of being incommoded.' The dress of the people of Sennaar consists only of a long shirt of blue cloth, which wraps them up from the under part of the neck to the feet. The men sometimes have a sash tied about their middle; and both men and women go barefooted in the houses, whatever their rank may be. The floors of their apartments, especially those of the women, are covered with Persian carpets. Both men and women anoint themselves, at least once a day, with camels' grease mixed with civet, which, they imagine, softens their skins, and preserves them from cutaneous eruptions, of which they are so fearful that they confine themselves to the house, if they observe the smallest pimple on their skins. With the same view of preserving their skins, though they have a clean shirt every day, they sleep with a greased one at night, having no other covering but this. Their bed is a tanned bull's hide, which this constant greasing softens very much; it is also very cool, though it gives a smell to their bodies from which they cannot be freed by any washing. Our author gives a very curious description of the queens and ladies of the court at Sennaar. He had access to them as a physician, and was permitted to pay his visit alone. He was first shown into a large square apartment, where there were about fifty black women, all quite naked, excepting a very narrow piece of cotton rag about their waists. As he was musing whether these were all queens, one of them took him by the hand, and led him into another apartment much better lighted than the former. Here he saw three women sitting upon a bench or sofa covered with blue Surat cloth; they themselves being clothed from the neck to the feet with cotton shirts of the same color. These were three of the king's wives; his favorite, who was one of the number, appeared to be about six feet high, and so corpulent that our traveller imagined her to be the largest creature he had seen next to the elephant and rhinoceros. Her features perfectly resembled those of a negro; a ring of gold passed through her under lip, and weighed it down, till, like a flap, it

covered her chin, leaving her teeth bare, which were small and very fine. The inside of her lip was made black with antimony. Her ears reached down to her shoulders, and had the appearance of wings; there was a gold ring in each of them about five inches in diameter, and somewhat smaller than a man's little finger; the weight of which had drawn down the hole, where her ear was pierced, so much that three fingers might easily pass above the ring. She had a gold necklace of several rows, one below another; to which were hung rows of sequins pierced. She had two manacles of gold upon her ankles, larger than those used for chaining felons. Our author could not imagine how it was possible for her to walk with them, till he was informed that they were hollow. The others were dressed much in the same manner; only there was one who had chains coming from her ears to the outside of each nostril, where they were fastened. A ring was also put through the gristle of her nose, and which hung down to the opening of her mouth; having altogether something of the appearance of a horse's bridle; and Mr. Bruce thinks that she must have breathed with difficulty.

SENNACHERIB, king of Assyria, succeeded his father Salmanasar, about A. A. C. 714. Hezekiah, king of Judea, having refused to pay him tribute, though he afterwards submitted, he invaded Judah with a great army, took several forts, and after repeated insolent and blasphemous messages besieged Jerusalem; but his army being suddenly smitten with a pestilence, which cut off 185,000 in a night, he returned to Nineveh, where he was murdered in the temple of Nisroch by his sons Adramelech and Sharezer, and was succeeded by his other son Esar-haddon. (See ASSYRIA, and 2 Kings xviii. and xix.) Herodotus tells us that he also attempted to invade Egypt, but was defeated by an army of rats. See EGYPT.

SENNAR. See SENNAAR.

SENNE, a river of the French empire, in the department of the Dyle, and ci-devant province of Austrian Brabant, which runs into the Demer, a little below Malines.

SENNEFIELD, an imperial town of Germany, allotted by the division of the indemnities to the king of Bavaria, the same with Sennfeld in Franconia, two miles south-east of Schweinfurt.

SENNERTUS (Daniel), an eminent physician, born in 1572 at Breslaw. In 1593 he was sent to Wirtemberg, where he made great progress in philosophy and physic. He visited the universities of Leipsic, Jena, Francfort on the Oder, and Berlin; but soon returned to Wirtemberg, where he obtained the degree of M. D., and soon after a professorship in the same faculty. He was the first who introduced the study of chemistry into that university, and gained great reputation by his works, his practice, and his benevolent disposition. He died of the plague at Wirtemberg, in 1637. By contradicting the ancients, he raised himself enemies. Having asserted that the seed of all living creatures is animated, and that the soul of this seed produces organisation, he was accused of impiety, and even blasphemy. Among his writings

are, *Epitome Naturalis Scientiæ*, 1618, 8vo., repeatedly printed; *Liber de Chymicorum consensu et dissensu cum Aristotelicis et Galenicis*, 1629, 4to.; and *Hypomnemata Physica*, 1650. These were much in request in the seventeenth century, and were published collectively at Lyons, 1676, 6 vols. folio.

SENNERTUS (Andrew), eldest son of the preceding, also received his education at Wirtemberg, and after visiting Leipsic, Jena, and Strassburg, and the Dutch universities, became professor of the oriental languages in that university. He died in 1679, aged sixty-three. Besides a number of philological dissertations, he was the author of *Hypotyposis Harmonica Linguarum Orientalium*, Chaldaeæ, Syrae, Arabicæ cum Matre Hebraea, 1666, 4to.; *Sciagraphia, Doctrinæ inextricabilis adhuc dei Accentibus Hebræorum*, 1664, 4to.; *Dissertatio de Linguarum Orientalium Originibus, Antiquitate, Progressione, Incrementis*, 1669; &c. &c.

SEN'NIGHT, *n. s.* Contracted from seven-night. The space of seven nights and days; a week. See *FOURNIGHT*. If mention is made, on Monday, of Thursday sennight, the Thursday that follows the next Thursday is meant.

Time trots hard with a young maid between the contract of her marriage and the day it is solemnized; if the interim be but a *se'nnight*, time's pace is so hard that it seems the length of seven years.

Shakspeare. As You Like It.

SENO'CULAR, *adj.* Lat. *seni* and *oculus*. Having six eyes.

Most animals are binocular, spiders octonocular, and some *senocular*. *Derham's Physico-Theology.*

SENOGALLIA, or SENA, an ancient town of Italy, in Umbria, on the Adriatic; built by the Galli Senones, A. U. C. 396.

SENONES, in ancient history and geography, a people of Gallia Celtica, situated on the Sequana to the south of the Parisii, near the confluence of the Jeavana or Yonne with that river. Their most considerable exploit was their invasion of Italy, and taking and burning of Rome. See *ROME*. This was done by a colony of them long before transported into Italy, and settled on the Adriatic. Their chief towns in Italy were Sena, Pisaurum, Ariminum, and Fanum Fortunæ. Their capital Agendicum, in Gaul, was in the lower age called Senones, now Sens. In Italy, the Senones extended themselves as far as the river Aesis; but were afterwards driven beyond the Rubicon, which became the boundary of Galla Cisalpina.—Polybius, Strabo.

SENS, a considerable town of France, in the department of the Yonne, situated on a hill watered by that river, and by the Vanne. It is the see of an archbishop, and to the college belongs a museum and library. It has manufactures of woollens, velvet, stockings, gloves, and leather; the trade consists in corn, wine, wool, coal, and hemp. Several ecclesiastical councils have been held here; among others that of 1140, in which the famous Abelard was condemned. It was taken by an allied force, chiefly Austrian, on the 11th of February, 1814, but evacuated soon after. Thirty-four miles west of Troyes, and eighty-four south-east of Paris.

SENSE, *n. s.*

SENSATION,

SENS'ED, *adj*

SENSE'FUL,

SENSE'LESS,

SENSE'LESSLY, *adv.*

SENSE'LESSNESS, *n. s.*

SENSIBI'LITY,

SENS'IBLE, *adj.*

SENS'IBLENESS, *n. s.*

SENS'IBLY, *adv.*

SENS'ITIVE, *adj.*

SENS'ITIVELY, *adv.*

SENSO'RIUM, *n. s.*

SENS'ORY,

SENSU'OUS, *adj.*

Fr. *sens*; Lat. *sen-*
sus. Faculty or power
by which external ob-
jects are perceived;
perception of such
objects; hence intel-
lectual perception;
apprehension; under-
standing; reason;
consciousness; hence
also, meaning; im-
port: sensation is, per-
ception by means of
the senses; hence men-
tal emotion; sensed
(obsolete), perceived
by the senses: senseful, reasonable, judicious
(also disused): senseless, wanting sense of any
kind; ignorant; stupid; unreasonable: the
adjective and adverb corresponding: sensibility
is quickness or delicacy of sensation; delicate
perception: sensible, having the use of the
senses or power of perception by them; percep-
tible by the senses or by the mind; perceiving
by the mind or senses; having moral or intel-
lectual perception; convinced, persuaded; ju-
dicious; wise: the noun substantive and adverb
following correspond: sensitive is having sense
or perception as distinct from reason; the adverb
corresponding: the sensorium or sensory is the
seat of sense, or that part of the body whence
the senses transmit the perceptions to the mind:
sensuous is tender; pathetic; (used only by
Milton).

This Basilus, having the quick *sense* of a lover,
took as though his mistress had given him a secret
reprehension. *Sidney.*

The charm and venom which they drunk,
Their blood with secret filth infected hath,
Being diffused through the *senseless* trunk,
That through the great contagion direful deadly
stunk. *Faerie Queene.*

In this *sense*, to be preserved from sin is not im-
possible. *Hooker.*

Endless and *senseless* effusions of indigested prayers
oftentimes disgrace, in most unsufferable manner,
the worthiest part of Christian duty towards God.

Id.

By reason man attaineth unto the knowledge of
things that are and are not *sensible*: it resteth, there-
fore, that we search how man attaineth unto the
knowledge of such things unsensible as are to be
known. *Id.*

That church of Christ, which we properly term
his body mystical, can be but one; neither can that
one be *sensibly* discerned by any, inasmuch as the
parts thereof are some in heaven already with Christ.
Id.

Would your cambrick were as *sensible* as your
finger, that you might leave picking it for pity.

Shakspeare.

If thou wert *sensible* of courtesy,
I should not make so great a shew of zeal. *Id.*

The *sensibleness* of the eye renders it subject to
pain, as also unfit to be dressed with sharp medica-
ments. *Id.*

He should have lived,
Save that his riotous youth, with dangerous *sense*.
Might in the times to come have ta'en revenge. *Id.*

My hearty friends,
You take me in too dolorous a *sense*. *Id.*

You blocks! you worse than *senseless* things! *Id.*

He is your brother, lords; *sensibly* fed
Of that self-blood that first gave life to you. *Id.*

These be those discourses of God, whose effects
those that live witness in themselves; the *sensible* in
their *sensible* natures, the reasonable in their reason-
able souls. *Raleigh.*

Spiritual species, both visible and audible, will
work upon the *sensories*, though they move not any
other body. *Bacon.*

In a living creature, though never so great, the
sense and the effects of any one part of the body in-
stantly make a transcurſion throughout the whole.

Id. Bacon's Natural History.

This color often carries the mind away, yea, it
deceiveth the *sense*; and it seemeth to the eye a
shorter distance of way, if it be all dead and con-
tinued, than if it have trees or buildings, or any
other marks whereby the eye may divide it.

Bacon.

Though things *sensible* be numberless,

Yet only five the *senses'* organs be!

And in those five all things their forms express,
Which we can touch, taste, feel, or hear, or see.

Davies.

If we had nought but *sense*, then only they
Should have sound minds which have their *senses*
sound;

But wisdom grows when *senses* do decay,

And folly most in quickest *sense* is found. *Id.*

To draw Mars like a young Hippolitus, with an
effeminate countenance, or that hot-spurred Harpa-
lice in Virgil, proceedeth from a *senseless* and over-
cold judgment. *Peaſham.*

The brain, distempered by a cold, beating against
the root of the auditory nerve, and protracted to the
tympanum, causes the *sensation* of noise.

Harvey on Consumption.

If we be not extremely foolish, thankless, or *sense-
less*, a great joy is more apt to cure sorrow than a
great trouble is. *Taylor.*

Some balances are so exact as to be *sensibly*
tuned with the eightieth part of a grain.

Wilkins's Math. Magic.

They would repent this their *senseless* perverseness
when it would be too late, and when they found
themselves under a power that would destroy them.

Clarendon.

Both contain
Within them every lower faculty
Of *reſe*, whereby they hear, ſee, ſmell, touch, taſte.

Milton.

God, to remove his ways from human *ſenſe*,
Placed heaven from earth ſo far. *Id.*

All before Richard I. is before time of memory,
and what is ſince, is, in a legal *ſenſe*, within the time
of memory. *Hale.*

Diversity of conſtitution, or other circumſtances,
vary the *ſenſations*; and to them of Java pepper is
cold. *Glauville's Scēpis.*

Let the ſcioliſt tell me, why things muſt needs be
ſo as his individual *ſenſes* repreſent them; is he ſure
that objects are not otherwiſe *ſenſed* by others, than
they are by him? And why muſt his *ſenſe* be the
infallible criterion? It may be, what is white to us,
is black to negroes. *Id.*

A blind man conceives not colours, but under the
noſion of ſome other *ſenſible* faculty. *Id.*

The ſpace left and acquired in every *ſenſible* mo-
ment in ſuch ſlow progreſſions, is ſo inconſiderable,
that it cannot poſſibly move the *ſenſe*. *Id.*

I ſpeak my private but impartial *ſenſe*,
With freedom, and, I hope, without offence.

Roscommon.

A haughty *preſumption*, that becauſe we are en-
Vol. XX

couraged to believe that in ſome *ſenſe* all things are
made for man, that therefore they are not made at
all for themſelves. *More.*

In one *ſenſe* it is, indeed, a building of gold and
ſilver upon the foundation of Chriſtianity. *Tillotſon.*

The great deſign of this author's book is to prove
this, which I believe no man in the world was ever
ſo *ſenſeſs* as to deny. *Id.*

Of the five *ſenſes* two are uſually and moſt properly
called the *ſenſes* of learning, as being moſt capable
of receiving communication of thought and notions
by ſelected ſigns: and theſe are hearing and ſeeing.

Holder's Elements of Speech.

Idleneſs was puniſhed by ſo many ſtripes in pub-
lic, and the diſgrace was more *ſenſible* than the pain.

Temple.

A ſudden pain in my right foot increaſed *ſenſibly*.

Id.

All the actions of the *ſenſitive* appetite are in
painting called paſſions, becauſe the ſoul is agitated
by them, and becauſe the body ſuffers and is *ſenſibly*
altered. *Dryden.*

Even I, the bold, the *ſenſible* of wrong,
Reſtrained by ſhame, was forced to hold my tongue.

Id.

Such is the mighty ſwiftness of your mind,

That, like the earth's, it leaves the *ſenſe* behind. *Id.*

In the due *ſenſe* of my want of learning, I only
make a confeſſion of my own faith. *Id.*

The wretch is drenched too deep;

His ſoul is ſtupid, and his heart aſleep,

Fattened in vice; ſo callous and ſo groſs,

He ſins and ſees not, *ſenſeſs* of his loſs. *Id.*

Some are ſo hardened in wickedneſs as to have no
ſenſe of the moſt friendly offices. *L'Eſtrange.*

I do not ſay there is no ſoul in man becauſe he is
not *ſenſible* of it in his ſleep; but I do ſay he cannot
think at any time, waking or ſleeping, without being
ſenſible of it. *Locke.*

Other creatures, as well as monkeys, little wiſer
than they, deſtroy their young by *ſenſeſs* fondneſs
and too much embracing. *Id.*

If any one ſhould be found ſo *ſenſeſsly* arrogant
as to ſuppoſe man alone knowing and wiſe, and but yet
the product of mere ignorance and chance, and that all
the reſt of the univerſe acted only by that blind hap-
hazard, I ſhall leave with him that very rational and
emphatical rebuke of Tully. *Id.*

This great ſource of moſt of the ideas we have de-
rived wholly upon our *ſenſes*, and derived by them
to the underſtanding, I call *ſenſation*. *Id.*

Vegetables have many of them ſome degrees of
motion, and, upon the different application of other
bodies to them, do very briskly alter their figure and
motion, and ſo have obtained the name of *ſenſitive*
plants, from a motion which has ſome reſemblance to
that which in animals follows upon *ſenſation*. *Id.*

Bodies are ſuch as are endued with a vegetative
ſoul, as plants; a *ſenſitive* ſoul, as animals; or a
rational ſoul, as the body of man. *Ray.*

The *ſenſitive* plant is ſo called becauſe, as ſoon as
you touch it, the leaf ſhrinks. *Mortimer.*

The *ſenſeſsneſs* of the tradition of the crocodile's
moving his upper jaw, is plain, from the articulation
of the occiput with the neck, and the nether jaw with
the upper. *Greſ.*

Men, otherwiſe *ſenſeful* and ingenious, quote ſuch
things out of an author as would never paſs in con-
verſation. *Norris.*

It is a *ſenſeſs* thing, in reaſon, to think that one
of theſe intereſts can ſtand without the other, when,
in the very order of natural cauſes, government is
preſerved by religion. *South's Sermons.*

The *ſenſeſs* grave feels not your pious ſorrows.

Roué

F

We name the *sensitive*, should move and feel?
 Whence know her leaves to answer her command,
 And with quick horror fly the neighbouring hand?
Prior.

She saw her favour was misplaced;
 The fellows had a wretched taste;
 She needs must tell them, to their face,
 They were a *senseless* stupid race.
Swift.

SENSES. The internal organs of the five senses—seeing, hearing, feeling, smelling, and tasting—are the nerves, small, thread-like fibres, distributed all over the body, and all connected with the brain. (See *Nerves*.) Few subjects, in comparative anatomy and physiology, have given rise to more various and contradictory opinions than the external organs of sense in some classes. Much misunderstanding on this point has arisen from the hasty application of inferences drawn from the human subject to other animals. Thus it has been supposed that those which possess a tongue must have it for the purpose of tasting, and that the sense of smell must be wanting where we are unable to trace the existence of a nose. But, in many instances, the tongue cannot, from its substance and mechanism, be considered as an organ of taste, and must be merely subservient to the ingestion and deglutition of food; while in many animals, particularly insects, an acute sense of smell seems to exist, although no part can be pointed out in the head which analogy would justify us in describing as the nose. The sense of touch appears to exist only in four classes of animals,—in most mammalia, in a few birds, in serpents, and probably in insects; and although all animals may possess that feeling which makes them sensible to the impressions of warmth and cold, very few possess, like the human subject, organs exclusively appropriated to the sense of touch, and expressly constructed for the purpose of feeling, examining, and exploring the qualities of external objects. (See *Touch*.) The sense of taste, as we have above remarked, does not appear to be confined to the tongue, that member being wanting in many animals which do not seem destitute of the sense; and in many which possess it, the tongue is employed for other and different purposes. (See *Taste*.) The sense of smelling prevails much more extensively in the animal kingdom than that of taste, since it not only assists several genera in selecting their food, which they have not afterwards the power of tasting, but is also of service in finding out proper objects for the satisfaction of their sexual appetites. (See *Smell*.) We should naturally expect to find an organ of hearing in most classes of animals, when we consider the various services which this sense performs, as that of indicating the approach of danger, of conducting beasts of prey to their food, &c.; and even in those animals, in which no external organ of hearing is discoverable, the sense is evidently not wanting. (See *Ear*, and *Hearing*.) The power of vision is confined to those animals which are provided with eyes for the reception of the images of external objects. Some species, even of the higher orders, are destitute of the organ of vision, which is also entirely wanting

in the lower classes of the animal creation. (See *Eye*, and *Optics*.) It is by the senses that the mysterious communication between the spiritual soul and the external world of being is kept up. The manner in which this is done, is unknown to us; we can trace the operation of outward matter, upon the organized material system, a few steps; but we soon lose sight even of these vestiges, and are obliged to acknowledge our ignorance of the workings of our own frame. We cannot give even a sketch of the speculations of philosophers on this subject, on which the history of philosophy, in fact, chiefly turns.

SENSE, COMMON, is a term that has been variously used both by ancient and modern writers. With some it has been synonymous with public sense; with others it has denoted prudence; in certain instances it has been confounded with some of the powers of taste; and, accordingly, those who commit egregious blunders with regard to decorum, saying and doing what is offensive to their company, and inconsistent with their own character, have been charged with a defect in common sense. Some men are distinguished by an uncommon acuteness in discovering the characters of others; and this talent has been sometimes called common sense; similar to which is that use of the term which makes it to signify that experience and knowledge of life which is acquired by living in society. To this meaning Quintilian refers, speaking of the advantages of a public education, lib. i. cap. 2. But the term common sense hath in modern times been used to signify that power of the mind which perceives truth, or commands belief, not by progressive argumentation, but by an instantaneous, instinctive, and irresistible impulse; derived neither from education nor from habit, but from nature; acting independently of our will whenever its object is presented, according to an established law, and therefore called sense; and acting in a similar manner upon all, or at least upon a great majority of mankind, and therefore called common sense. See *METAPHYSICS*, and *MORAL PHILOSOPHY*.

SENSE, MORAL, is a determination of the mind to be pleased with the contemplation of those affections, actions, or characters, of rational agents, which we call good or virtuous. This moral sense of beauty in actions and affections may appear strange at first view; some of our moralists themselves are offended at it in lord Shaftesbury, as being accustomed to deduce every approbation or aversion from rational views of interest. It is certain that his lordship has carried the influence of the moral sense very far, and some of his followers have carried it farther. The advocates for the selfish system seem to drive their opinions to the opposite extreme, and we have elsewhere endeavoured to show that the truth lies between the contending parties. See *MORAL PHILOSOPHY*.

SENSE, PUBLIC, is defined by the noble author of the *Characteristics* to be an innate propensity to be pleased with the happiness of others, and to be uneasy at their misery. It is found, he says, in a greater or less degree in all men, and was sometimes called *κοινωνικα*, or *sensus communis*, by ancient writers. Of the reality of this

public sense, we have great doubts. The conduct of savages, who are more under the influence of original instinct than civilised men, gives no countenance to it. Their affections seem all to be selfish, or to spring from self-love variously modified. For the happiness of their wives they have very little regard; considering them merely as instruments of their own pleasure, and valuing them for nothing else. Hence they make them toil, while they themselves indulge in listless idleness. To their children, we believe, they exhibit strong symptoms of attachment, as soon as they derive assistance from them in war, or in the business of the chase; but, during the helpless years of infancy, the child is left by the selfish father wholly to the care and protection of its wretched mother; who, impelled by the storgé of all females to their young, cherishes her offspring with great fondness. The savage is, indeed, susceptible of strong attachments, similar to that which we call friendship; but such attachments are no proofs of disinterested benevolence, or what his lordship calls the public sense. Two barbarous heroes are probably first linked together by the observation of each other's prowess in war, or their skill in pursuing their game; for such observations cannot fail to show them that they may be useful to one another; and we have elsewhere shown how real friendship may spring from sentiments originally selfish. The savage is very much attached to his horde or tribe, and this attachment resembles patriotism; but patriotism itself is not a sentiment of pure benevolence, delighting in the happiness of others and grieving at their misery: for the patriot prefers his own country to all others, and is not very scrupulous with respect to the rectitude of the means by which he promotes its interest, or depresses its rivals. Witness Cato, whose patriotic attachment to his own country was equalled or exceeded by his vindictive malice against the Carthaginians. See CATO. The savage pursues with relentless rigor the enemies of himself, or the tribe to which he belongs; shows no mercy to them when in his power, but puts them to the cruellest death, and carries their scalps to the leader of his party. These facts, which cannot be controverted, are perfectly irreconcilable with innate benevolence, or a public sense, comprehending the whole race of men; and show the truth of that theory by which we have in another place endeavoured to account for all the passions, social as well as selfish. See MORAL PHILOSOPHY.

SENSIBILITY, is a nice and delicate perception of pleasure or pain, beauty or deformity. It is very nearly allied to taste; and, as far as it is natural, seems to depend upon the organization of the nervous system. It is capable, however, of cultivation, and is experienced in a much higher degree in civilised than in savage nations, and among persons liberally educated than among boors and illiterate mechanics. He who has been long accustomed to that decorum of manners which characterises the polite part of the world, perceives almost instantaneously the smallest deviation from it, and feels himself almost as much hurt by behaviour harmless in itself, as by the grossest rudeness; and the man

who has long proceeded steadily in the paths of virtue, and often reflected on the deformity of vice, and the miseries of which it is productive, is more quickly alarmed at any deviation from rectitude, than another who, though his life has been stained by no crime, has yet thought less upon the principles of virtue and consequences of vice. That sensibility which we either have from nature, or necessarily acquire, of the miseries of others, is of the greatest use when properly regulated, as it powerfully impels us to relieve their distress; but, if it by any means becomes so exquisite as to make us shun the sight of misery, it counteracts the end for which it was implanted in our nature, and only deprives us of happiness, while it contributes nothing to the good of others. Indeed there is reason to believe that all such extreme sensibilities are selfish affectations, employed as apologies for withholding from the miserable that relief which it is in our power to give; for there is not a fact better established in the science of human nature, than that passive perceptions grow gradually weaker by repetition, while active habits daily acquire strength. It is every man's duty to cultivate his moral sensibilities, so as to make them subservient to the purposes for which they were given to him; but if he either feel, or pretend to feel, the miseries of others to so exquisite a degree as to be unable to afford them the relief which they have a right to expect, his sensibilities are perverted. That the man of true sensibility has more pains and more pleasures than the callous wretch, is universally admitted, as well as that his enjoyments and sufferings are more exquisite in their kinds; but as no man lives for himself alone, no man will acknowledge his want of sensibility, or express a wish that his heart were callous. See PHYSIOLOGY.

SENSITIVE PLANT. See DIONEÆ, HEDYSARUM, and MIMOSA. The sensitive plants are well known to possess a kind of motion, by which the leaves and stalks are contracted and fall down upon being slightly touched, or shaken with some degree of violence. The contraction of the leaves and branches of the sensitive plant when touched is a very singular phenomenon. Different hypotheses have been formed by botanists to explain it; but these have generally been deduced rather from analogical reasoning than from a collection of facts and observations. The following are the most important facts collected upon this curious subject. 1. It is difficult to touch the leaf of a healthy sensitive plant so delicately that it will not immediately collapse, the foliola or little leaves moving at their base till they come into contact, and then applying themselves close together. If the leaf be touched with a little more force, the opposite leaf will exhibit the same appearance. If a little more force be applied the partial foot-stalks bend down towards the common foot-stalk from which they issue, making with it a more acute angle than before. If the touch be more violent still, all the leaves situated on the same side with the one that has been touched will instantly collapse, and the partial foot-stalk will approach the common foot-stalk to which it is attached, in the same manner as the partial foot-stalk of the leaf approaches the

stem or branch from which it issues; so that the whole plant, from having its branches extended, will immediately appear like a weeping willow. 2. These motions of the plant are performed by means of three distinct and sensible articulations. The first, that of the foliola or lobes to the partial foot-stalk; the second, that of the partial foot-stalk to the common one; the third, that of the common foot-stalk to the trunk. The primary motion of all is the closing of the leaf upon the partial footstalk, which is performed in a similar manner, and by a similar articulation. This, however, is much less visible than the others. These motions are wholly independent on one another. 3. Winds and heavy rains make the leaves of the sensitive plant contract and close; but no such effect is produced from slight showers. 4. At night, or when exposed to much cold in the day, the leaves meet and close in the same manner as when touched, folding their upper surfaces together, and in part over each other, like scales or tiles, so as to expose as little as possible of the upper surface to the air. The opposite sides of the foliola or leaves do not come close together in the night, for when touched they apply themselves closer together. Dr. Darwin kept a sensitive plant in a dark place for some hours after day-break; the leaves and foot-stalks were collapsed as in its most profound sleep; and on exposing it to the light above twenty minutes passed before it was expanded. 5. In August a sensitive plant was carried in a pot out of its usual place into a dark cave, the motion that it received in the carriage shut up its leaves, and they did not open till twenty-four hours afterwards; at this time they became moderately open, but were afterwards subject to no changes at night or morning, but remained three days and nights with their leaves in the same moderately open state. At the end of this time they were brought out again into the air, and there recovered their natural periodical motions, shutting every night, and opening every morning as naturally and as strongly as if the plant had not been in this forced state; and while in the cave it was observed to be very little less affected with the touch than when abroad in the open air. 6. The great heats of summer, when there is open sunshine at noon, affect the plant in some degree like cold, causing it to shut up its leaves a little, but never in any very great degree. The plant, however, is least of all affected about 9 A. M., and that is consequently the most proper time to make experiments on it. A branch of the sensitive plant cut off, and laid by, retains yet its property of shutting up and opening in the morning for some days; and it holds it longer if kept with one end in water, than if left to dry more suddenly. 7. The leaves only of the sensitive plant shut up in the night, not the branches; and if it be touched at this time the branches are affected in the same manner as in the day, shutting up, or approaching to the stalk or trunk, in the same manner, and often with more force. It is of no consequence what the substance is with which the plant is touched; but there is a little spot, distinguishable by its paler color in the articulation of its leaves, where the greatest and nicest sensibility is evidently placed. 8. Du

Hamel having observed, about the 15th of September, in moderate weather, the natural motion of a branch of a sensitive plant, remarked that at 9 A. M. it formed with the stem an angle of 100° ; at noon 112° ; at 3 P. M. it returned to 100° ; and after touching the branch the angle was reduced to 90° . Three-quarters of an hour after it had mounted to 112° ; and at 8 P. M. it descended again without being touched to 90° . The day after, in finer weather, the same branch, at 8 A. M., made an angle of 135° with the stem; after being touched the angle was diminished to 80° ; an hour after it rose again to 135° ; being touched a second time it descended again to 80° ; an hour and a half after it had risen to 145° ; and upon being touched a third time descended to 135° ; and remained in that position till 5 P. M. when, being touched a fourth time, it fell to 110° . 9. The parts of the plant which have collapsed afterwards unfold themselves, and return to their former expanded state. The time required for that purpose varies according to the vigor of the plant, the season of the year, the hour of the day, the state of the atmosphere. Sometimes half an hour is requisite, sometimes only ten minutes. The order in which the parts recover themselves varies in like manner; sometimes it is the common foot-stalk; sometimes the rib to which the leaves are attached; and sometimes the leaves themselves are expanded before the other parts have made any attempt to recover their former position. 10. If, without shaking the other smaller leaves, we cut off the half of a leaf or lobe belonging to the last pair, at the extremity or summit of a wing, the leaf cut, and its antagonist, that is to say, the first pair, begin to approach each other; then the second, and so on successively, till all the lesser leaves, or lobes of that wing, have collapsed in like manner. Frequently, after twelve or fifteen seconds, the lobes of the other wings, which were not immediately affected by the stroke, shut; whilst the stalk and its wing, beginning at the bottom, and proceeding in order to the top, gradually recover themselves. If, instead of one of the lesser extreme leaves, we cut off one belonging to the pair that is next the foot-stalk, its antagonist shuts, as do the other parts successively, from the bottom to the top. If all the leaves of one side of a wing be cut off, the opposite leaves are not affected, but remain expanded. With some address it is possible even to cut off a branch without hurting the leaves, or making them fall. The common foot-stalk of the winged leaves being cut as far as three-fourths of its diameter, all the parts which hang down collapse, but quickly recover without appearing to have suffered any considerable violence by the shock. An incision being made into one of the principal branches, to the depth of half the diameter, the branches betwixt the section and the root will fall down; those above the incision remain as before, and the lesser leaves continue open; but this direction is soon destroyed by cutting off one of the lobes at the extremity. A whole wing being cut off with precaution, near its insertion into the common foot-stalk, the other wings are not affected by it and its own lobes do not shut. No motion ensues from piercing the branch with a needle or

other sharp instrument. 11. If the end of one of the leaves be burned with the flame of a candle, or by a burning glass, or by touching it with hot iron, it closes up in a moment, and the opposite leaf does the same, and after that the whole series of leaves on each side of the partial or little foot-stalk; then the foot-stalk itself; then the branch or common foot-stalk; all do the same if the burning has been in a sufficient degree. This proves that there is a very nice communication between all the parts of the plant, by means of which the burning, which only is applied to the extremity of one leaf, diffuses its influence through every part of the shrub. If a drop of aquafortis be carefully laid upon a leaf of the sensitive plant, so as not to shake it in the least, the leaf does not begin to move till the acrid liquor corrodes the substance of it; but at that time not only that particular leaf, but all the leaves placed on the same foot-stalk, close themselves up. The vapor of burning sulphur has also this effect on many leaves at once, according as they are more or less exposed to it; but a bottle of very acrid and sulphureous spirit of vitriol, placed under the branches unstopped, produces no such effect. Wetting the leaves with spirit of wine has been observed also to have no effect, nor the rubbing oil of almonds over them; though this last application destroys many plants. From the preceding experiments the following conclusions may be fairly drawn:

1. The contraction of the parts of the sensitive plant is occasioned by an external force, and the contraction is in proportion to the force. 2. All bodies which can exert any force affect the sensitive plant; some by the touch or by agitation, as the wind, rain, &c.; some by chemical influence, as heat and cold. 3. Touching or agitating the plant produces a greater effect than an incision or cutting off a part, or by applying heat or cold. Attempts have been made to explain these curious phenomena. Dr. Darwin, in the notes to his admired poem entitled the Botanic Garden, lays it down as a principle, that 'the sleep of animals consists in a suspension of voluntary motion; and, as vegetables are subject to sleep as well as animals, there is reason to conclude, says he, that the various action of closing their petals and foliage may be justly ascribed to a voluntary power; for without the faculty of volition sleep would not have been necessary to them.' Whether this definition of sleep when applied to animals be just, we shall not enquire; but it is evident that the supposed analogy between the sleep of animals and the sleep of plants has led Dr. Darwin to admit this astonishing conclusion, that plants have volition! As volition presupposes a mind or soul, it were to be wished that he had given us some information concerning the nature of a vegetable soul, which can think and will. We suspect, however, that this vegetable soul will turn out to be a mere mechanical or chemical one; for it is affected by external forces uniformly in the same way, its volition is merely passive, and never makes any successful resistance against those causes by which it is influenced. All this is a mere abuse of words. The sleep of plants is a metaphorical expression, and has not the least resemblance to the sleep of

animals. Plants are said to sleep when the flowers or leaves are contracted or folded together; but we never heard that there is any similar contraction in the body of an animal during sleep. See *PHYSIOLOGY*. The fibres of vegetables have been compared with the muscles of animals, and the motions of the sensitive plant have been supposed the same with muscular motion. Between the fibres of vegetables and the muscles of animals, however, there is not the least similarity. If muscles be cut through, so as to be separated from the joints to which they are attached, their powers are completely destroyed; but this is not the case with vegetable fibres. The following very ingenious experiment, which was communicated to us by a respectable member of the university of Edinburgh, is decisive on this subject. He selected a growing poppy, at that period of its growth, before unfolding, when the head and neck are bent down almost double. He cut the stalk where it was curved half through on the under side, and half through at a small distance on the upper side, and half through in the middle point between the two sections, so that the ends of the fibres were separated from the stalk. Notwithstanding these several cuttings on the neck, the poppy raised its head, and assumed a more erect position. There is, therefore, a complete distinction between muscular motion and the motions of a plant; for no motion can take place in the limb of an animal when the muscles of that limb are cut. In fine, we look upon all attempts to explain the motions of plants as absurd, and all reasoning from supposed analogy between animals and vegetables as the source of wild conjecture, and not of sound philosophy. We view the contraction and expansion of the sensitive plant in the same light as we do gravitation, chemical attraction, electricity, and magnetism, as a singular fact, the circumstances of which we may be fully acquainted with, but must despair of understanding its cause. What has been said under this article chiefly refers to the *mimosa sensitiva* and *pudica*. For a full account of the motions of vegetables in general, see *MOTION*.

SENSITIVE PLANT, *BASTARD*. See *ÆSCHYNOMENE*.

SENSORIUM, in anatomy. See *ANATOMY*.

SENSUAL, *adj.* } Fr. *sensual*. Consisting
 SENSUALIST, *n. s.* } in sense; depending on
 SENSUALITY, } or affecting the senses;
 SENSUALIZE, *v. a.* } devoted to sense; affect-
 SENSUALLY, *adv.* } ing the senses; lewd: all
 the derivatives follow these senses.

The greatest part of men are such as prefer their own private good before all things, even that good which is *sensual* before whatever is most divine.

Hooker.

But you are more intemperate in your blood
 Than Venus, or those pampered animals

That rage in savage *sensuality*. *Shakspeare.*

Kill not her quickening power with surfeitings;

Mar not her sense with *sensuality*;

Cast not her serious wit on idle things;

Make not her free-will slave to vanity. *Davi. s.*

From amidst them rose
 Belial, the dissolutes spirit that fell;

The *sensualist*, and after Asmodai

The fleshliest incubus.

Milton.

Men in general are too partial in favour of a *sensual* appetite, to take notice of truth when they have found it.
L'Estrange.

Let atheists and *sensualists* satisfy themselves as they are able; the former of which will find, that, as long as reason keeps her ground, religion neither can nor will lose hers.
South.

Sensuality is one kind of pleasure, such an one as it is.
Id.

They avoid dress, lest they should have affections tainted by any *sensuality*, and diverted from the love of him who is to be the only comfort and delight of their whole beings.
Addison.

No small part of virtue consists in abstaining from that wherein *sensual* men place their felicity.
Atterbury.

Impure and brutal *sensuality* was too much confirmed by the religion of those countries, where even Venus and Bacchus had their temples.
Bentley.

Far as creation's ample range extends,
The scale of *sensual*, mental powers ascends. *Pope.*

Not to suffer one's self to be *sensualized* by pleasures, like those who were changed into brutes by Circe.
Id.

SENTENCE, <i>n. s. & v. a.</i>	} Fr. <i>sentence</i> ; Latin <i>sententia</i> . Determination or decision; legal decision or doom ; maxim ; short paragraph or period : <i>sententious</i> is comprehension in a sentence : <i>sententious</i> , abounding in maxims or proverbs ; comprising sentences : the adverb and noun substantive corresponding.
SENTENTIOSITY,	
SENTENTIOUS, <i>adj.</i>	
SENTENTIOUSLY, <i>adv.</i>	
SENTENTIOUSNESS, <i>n. s.</i>	

Now also will I give *sentence* against them.

Jeremiah iv. 12.

An excellent spirit, knowledge, understanding, and shewing of hard *sentences* were found in Daniel.

Dan. v. 12.

If we have neither voice from heaven, that so pronounceth of them, neither *sentence* of men grounded upon such manifest and clear proof, that they, in whose hands it is to alter them, may likewise infallibly, even in heart and conscience, judge them so : upon necessity to urge alteration, is to trouble and disturb without necessity.
Hooker.

After this cold consideration *sentence* me ;
And, as you are a king, speak in your state,
What I have done that misbecame my place.

Shakspeare.

He is very swift and *sententious*.

Id. As You Like It.

By the consent of all laws, in capital causes, the evidence must be full and clear ; and if so, where one man's life is in question, what say we to a war, which is ever the *sentence* of death upon many ?

Bacon's Holy War.

They describe her in part finely and elegantly, and in part gravely and *sententiously* : they say, look how many feathers she hath, so many eyes she hath underneath.
Id. Essays.

Eyes are vocal, ears have tongues :
Sententious showers ! O let them fall !

Their cadence is rhetorical.

Crashaw

What rests but that the mortal *sentence* pass ?

Milton

Came the mild judge and intercessor both
To *sentence* man.

Id.

Vulgar precepts in morality carry with them nothing above the line, or beyond the extemporary *sententiousness* of common conceits with us.

Broune's Vulgar Errors.

Eloquence, with all her pomp and charms,
Foretold us useful and *sententious* truths. *Waller.*
Idleness, *sentenced* by the decurions, was *punished*
by so many stripes. *Temple.*

Could that decree from our brother come ?

Nature herself is *sentenced* in your doom :

Piety is no more.

Dryden.

The Medea I esteem for the gravity and *sententiousness* of it, which he himself concludes to be suitable to a tragedy.
Id.

The making of figures being tedious, and requiring much room, put men first upon contracting them, as by the most ancient Egyptian monuments it appears they did : next, instead of *sententious* marks, to think of verbal, such as the Chinese still retain.

Grew's Cosmologia.

If matter of fact breaks out with too great evidence to be denied, why, still there are other lenitives, that friendship will apply, before it will be brought to the decretory rigours of a condemning *sentence*.
South's Sermons.

How he apes his sire,
Ambitiously *sententious* !

Addison's Cato.

Let him set out some of Luther's works, that by them we pass *sentence* upon his doctrines.

Atterbury.

A *sentence* may be defined a moral instruction couched in few words. *Broune's Notes on Odyssey.*

Nausicaa delivers her judgment *sententiously*, to give it more weight.
Broune.

SENTENCE, in grammar, denotes a period, or a set of words comprehending some perfect sense or sentiment of the mind. The business of pointing is to distinguish the several parts or members of sentences, so as to render the sense thereof as clear, distinct, and full as possible. See PUNCTUATION. In every sentence there are two parts necessarily required : a noun for the subject, and a definite verb ; whatever is found more than these two affects one of them, either immediately, or by the intervention of some other, whereby the first is affected. Again, every sentence is that consisting of one single subject and one finite verb. A compound sentence contains several subjects and finite verbs, either expressly or implicitly. A simple sentence needs no point or distinction ; only a period to close it : as, 'A good man loves virtue for itself.'—In such a sentence the several adjuncts affect either the subject or the verb in a different manner. Thus the word good expresses the quality of the subject, virtue the object of the action, and for itself, the end thereof. Now none of these adjuncts can be separated from the rest of the sentence ; for if one be why should not all the rest ? and, if all be, the sentence will be minced into almost as many parts as there are words. But if, several adjuncts be attributed in the same manner either to the subject or the verb, the sentence becomes compound, and is to be divided into parts. In every compound sentence as many subjects, or as many finite verbs as there are, either expressly or implied, so many distinctions may there be. Thus, 'My hopes, fears, joys, pains, all centre in you.' And thus, Catilina abiit, excessit, evasit, erupit. The reason of which pointing is obvious ; for as many subjects or finite verbs as there are in a sentence, so many members does it really contain. Whenever, therefore, there occur more nouns than verbs, or contrariwise, they are to be conceived as equal. Since, as every subject requires its

verbs, so every verb requires its subject, where-with it may agree; excepting, perhaps, in some figurative expressions.

SENTICOSE (from *sentis*, a briar or bramble), the name of the thirty-fifth order in Linnaeus's fragments of a natural method, consisting of rose, bramble, and other plants, which resemble them in port and external structure. See **BOTANY**, Index.

SENTIENT, *adj.* Lat. *sentiens*. Perceiving; having perception.

This acting of the *sentient* phantasy is performed by a presence of sense, as the horse is under the sense of hunger, and that, without any formal syllogism, presseth him to eat.

If the *sentient* be carried, *passibus æquis*, with the body whose motion it would observe, supposing it regular, the remove is insensible.

Glanville's Scep sis.

SENTIMENT, *n. s.* Fr. *sentiment*. Thought; notion; opinion; the sense or meaning of a composition; a particular or striking thought.

The consideration of the reason why they are annexed to so many other ideas, serving to give us due *sentiments* of the wisdom and goodness of the sovereign Disposer of all things, may not be unsuitable to the main end of these enquiries. *Locke.*

Those who could no longer defend the conduct of Cato, praised the *sentiments*. *Dennis.*

One of differing *sentiments* would have drawn Luther over to his party. *Atterbury.*

Alike to council or the assembly came,
With equal souls and *sentiments* the same. *Pope.*

Thomas Tusser, who though he wrote in verse now almost unintelligible, was a very honest and a very sensible man, was a great friend to inclosures, and for this reason quoted by Blith and others in support of their concurring *sentiments* on this subject.

Campb. Pol. Surv.

There is nothing in itself valuable or despicable, desirable or hateful, beautiful or deformed; but these attributes arise from the particular constitution and fabric of human *sentiment* and affection.

Hume.

SENTIMENT, according to lord Kames, is a term appropriated to such thoughts as are prompted by passion. It differs from a perception; for a perception signifies the act by which we become conscious of external objects. It differs from consciousness of an internal action, such as thinking, suspending thought, inclining, resolving, willing, &c. And it differs from the conception of a relation among objects; a conception of that kind being termed opinion.

SENTIMENTS, in poetry. To talk in the language of music, each person has a certain tone, to which every sentiment proceeding from it ought to be tuned with the greatest accuracy: which is no easy work, especially where such harmony ought to be supported during the course of a long theatrical representation. To reach such delicacy of execution, it is necessary that a writer assume the precise character and passion of the personage represented; which requires an uncommon genius. But it is the only difficulty; for the writer, who, annihilating himself, can thus become another person, need be in no pain about the sentiments that belong to the assumed character: these will flow without study, or even preconception; and will fre-

quently be as delightfully new to himself as to his reader. But if a lively picture even of a single emotion require an effort of genius, how much greater the effort to compose a passionate dialogue with as many different tones of passion as there are speakers! With what ductility of feeling must that writer be endued, who approaches perfection in such a work; when it is necessary to assume different and even opposite characters and passions in the quickest succession! Yet this work, difficult as it is, yields to that of composing a dialogue in genteel comedy, exhibiting characters without passion. The reason is, that the different tones of character are more delicate, and less in sight, than those of passion; and, accordingly, many writers, who have no genius for drawing characters, make a shift to represent, tolerably well, an ordinary passion in its simple movements. But of all works of this kind, what is truly the most difficult is a characteristical dialogue upon any philosophical or philological subject; to interweave characters with reasoning, by suiting to the character of each speaker a peculiarity not only of thought but of expression, requires the perfection of genius, taste, and judgment. A deficiency in this leads a writer to convert himself into a spectator, so as to figure, in some obscure manner, an action as passing in his sight and hearing. In that figured situation, being led to write like a spectator, he entertains his readers with his own reflections, with cool description, and florid declamation; instead of making them eye-witnesses, as it were, to a real event, and to every movement of genuine passion. Thus most of our plays appear to be cast in the same mould; personages without character, the mere outlines of passion, a tiresome monotony, and a pompous declamatory style. Unhappy is the player of genius who acts a part in what may be termed a descriptive tragedy; after assuming the very passion that is to be represented, how he is cramped in action, when he must utter, not the sentiments of the passion he feels, but a cold description in the language of a by-stander! It is that imperfection, undoubtedly, in the bulk of our plays, which confines our stage almost entirely to Shakspeare, notwithstanding his many irregularities. In our late English tragedies, we sometimes find sentiments tolerably well adapted to a plain passion: but we must not in any of them expect a sentiment expressive of character; and, upon that very account, our late performances of the dramatic kind are for the most part intolerably insipid. But it is proper to illustrate this subject by examples. The first examples shall be of sentiments that appear the legitimate offspring of passion; to which shall be opposed what are descriptive only, and illegitimate; and, in making this comparison, the instances shall be borrowed from Shakspeare and Corneille, who for genius in dramatic composition stand uppermost in the rolls of fame. I. Shakspeare shall furnish the first example, being of sentiments dictated by a violent and perturbed passion:—

Learn.

· Filial ingratitude!

Is it not as if this mouth should tear this hand

For lifting food to't?—But I'll punish home:

No, I will weep no more.—— In such a night

To shut me out! ———— Pour on, I will endure.
In such a night as this! O Regan, Goneril!
Your old kind father, whose frank heart gave all—
O! that way madness lies; let me shun that;
No more of that. ———— Act 3, sc. 3.

With regard to the French author, truth obliges us to acknowledge that he describes in the style of a spectator, instead of expressing passion like one who feels it; which naturally betrays him into a pompous declamatory style. It is scarcely necessary to give examples, for he never varies from that tone. We shall, however, take two passages at a venture, to be confronted with the above. In the tragedy of *Cinna*, after the conspiracy was discovered, *Æmilia*, having nothing in view but racks and death to herself and her lover, receives a pardon from Augustus, attended with the brightest circumstances of magnanimity and tenderness. This is a lucky situation for representing the passions of surprise and gratitude in their different stages, which seem naturally to be what follow. These passions, raised at once to the utmost pitch, and being at first too big for utterance, must, for some moments, be expressed by violent gestures only; so soon as there is vent for words, the first expressions are broken and interrupted: at last, we ought to expect a tide of intermingled sentiments, occasioned by the fluctuation of the mind between the two different passions. *Æmilia* is made to behave in a very different manner: with extreme coolness she describes her own situation, as if she were merely a spectator; or rather the poet takes the task off her hands:—

Et je me rends, Seigneur, à ces hautes bontés;
Je recouvre la vie auprès de leurs clartés.
Je connois mon forfait qui me sembloit justice;
Et ce que n'avoit pu la terreur du supplice,
Je sens naître en mon ame un repentir puissant,
Et mon cœur en secret me dit, qu'il y consent, &c.
Act 5, sc. 3.

So much in general upon the genuine sentiments of passion. We proceed to particular observations. And, first, passions seldom continue uniformly any considerable time; they generally fluctuate, swelling and subsiding by turns, often in a quick succession, and the sentiments cannot be just unless they correspond to such fluctuation. Accordingly, a climax never shows better than in expressing a swelling passion; the following passage may suffice for an illustration:—

I would not be the villain that thou think'st
For the whole space that's in the tyrant's grasp,
And the rich earth to boot. *Macbeth*, act 4, sc. 4.
The following passage expresses finely the progress of conviction:—

Let me not stir nor breathe, lest I dissolve
That tender, lovely form, of painted air,
So like *Alberia*. Ha! it sinks, it falls;
I'll catch it ere it goes, and grasp her shade.
'Tis life! 'tis warm! 'tis she! 'tis she herself!
It is *Alberia*! 'tis, it is my wife!

Mourning Bride, act 2, sc. 6.

In the progress of thought, our resolutions become more vigorous as well as our passions:—

If ever I do yield or give consent,
By any action, word, or thought, to wed
Another lord, may then just heav'n shower down,
&c. *Mourning Bride*, act 1, sc. 1.

This leads to a second observation, That the different stages of a passion, and its different directions, from birth to extinction, must be carefully represented in their order, because otherwise the sentiments, by being misplaced, will appear forced and unnatural. Resentment, for example, when provoked by an atrocious injury, discharges itself first upon the author; sentiments therefore of revenge come always first, and must in some measure be exhausted before the person injured think of grieving for himself. See examples of this in the *Cid* of *Corneille*, act 1, sc. 7; the *Aminta* of *Tasso*, act 4, sc. 2, and the tragedy of *Jane Shore*, act 3, sc. 1. 3. A person sometimes is agitated at once by different passions; and the mind in that case, vibrating like a pendulum, vents itself in sentiments that partake of the same vibration.

Queen. Would I had never trod this English earth,

Or felt the flatteries that grow upon it!
Ye've angel's faces, but heav'n knows your hearts.
What shall become of me now? wretched lady!
I am the most unhappy woman living.
Alas! poor wenches, where are now your fortunes?

[To her woman.]

Shipwreck'd upon a kingdom, where no pity,
No friends, no hope, no kindred weep for me!
Almost no grave allowed me.

Henry VIII., act 3, sc. 1.

Æmilia. Oh! my good lord, I would speak a word with you.

Othello. Yes, 'tis *Æmilia*—By and by.—She's dead.

'Tis like she comes to speak of *Cassio's* death;
The noise was high—Ha! no more moving?
Still as the grave. Shall she come in? we'll good?
I think she stirs again—No—what's the best?
If she come in, she'll sure speak to my wife:
My wife! my wife! what wife? I have no wife;
Oh insupportable! oh heavy hour?

Othello, act 5, sc. 7.

4. A fourth observation is, That nature, which gave us passions, and made them extremely beneficial when moderate, intended undoubtedly that they should be subjected to the government of reason and conscience. It is therefore against the order of nature that passion in any case should take the lead in contradiction to reason and conscience: such a state of mind is a sort of anarchy which every one is ashamed of and endeavours to hide or dissemble. Even love, however laudable, is attended with a conscious shame when it becomes immoderate; it is covered from the world, and disclosed only to the beloved object:—

Et que l'amour souvent de remors combattu
P'aroisse une foiblesse, et non une vertu.

Boileau, l'Art Poet, chant. 3, l. 101.

O, they love least that let men know they love.

Two Gentlemen of Verona, act 1, sc. 3.

Hence a capital rule in the representation of immoderate passions, that they ought to be hid or dissembled as much as possible. And this holds in a special manner with respect to criminal passions: one never counsels the commission of a crime in plain terms; guilt must not appear in its native colors, even in thought; the proposal must be made by hints, and by representing the action in some favorable light. Of the propriety

of sentiment upon such an occasion, Shakspeare, in the *Tempest*, has given us a beautiful example, in a speech by the usurping duke of Milan, advising Sebastian to murder his brother the king of Naples :—

Antonio. ————— What might, Worthy Sebastian,—O, what might,—no more. And yet, methinks I see it in thy face What thou should'st be : the occasion speaks thee, and

My strong imagination sees a crown Dropping upon thy head. Act 2, sc. 2.

A picture of this kind, perhaps still finer, is exhibited in king John, where that tyrant solicits (act 3, sc. 5.) Hubert to murder the young prince Arthur ; but it is too long to be inserted here. II. As things are best illustrated by their contraries, we proceed to faulty sentiments, of which we shall quote examples from the most approved authors. The first class contains faulty sentiments of various kinds, which we shall endeavour to distinguish from each other. 1. Of sentiments that are faulty by being above the tone of the passion, the following is an example :—

Othello. ————— O my soul's joy ! If after every tempest comes such calms, May the winds blow till they have waken'd death ; And let the laboring bark climb hills of seas Olympus high, and duck again as low As hell's from heaven ! *Othello*, act 2, sc. 6.

This sentiment may be suggested by violent and inflamed passion, but is not suited to the satisfaction, however great, that one feels upon escaping danger. 2. Instance of sentiments below the tone of the passion. Ptolemy, by putting Pompey to death, having incurred the displeasure of Cæsar, was in the utmost dread of being dethroned : in that agitating situation, Corneille makes him utter a speech full of cool reflection, that is in no degree expressive of the passion. See *La Mort de Pompé*, act 4, sc. 1. 3. Sentiments that agree not with the tone of the passion ; as where a pleasant sentiment is grafted upon a painful passion, or the contrary. In the following instances the sentiments are too gay for a serious passion :—

No happier task these faded eyes pursue ; To read and weep is all they now can do.

Eloisa to Abelard, l. 47.

4. Sentiments too artificial for a serious passion. The first example is a speech of Percy expiring :—

O, Harry, thou hast robb'd me of my growth : I better brook the loss of brittle life, Than those proud titles thou hast won of me ; They wound my thoughts worse than thy sword my flesh.

But thought's the slave of life, and life time's fool ; And time, that takes survey of all the world Must have a stop.

First Part, Henry IV., act 5, sc. 9.

The sentiments of the Mourning Bride are for the most part no less delicate than just copies of nature. In the following exception the picture is beautiful, but too artful to be suggested by severe grief :—

Almeria. O no ! Time gives increase to my afflictions. The circling hours, that gather all the woes

Which are diffused through the revolving year, Come heavy laden with the oppressive weight To me ; with me, successively, they leave The sighs, the tears, the groans, the restless cares, And all the damps of grief, that did retard their flight ;

They shake their downy wings, and scatter all The dire collected dews on my poor head ; Then fly with joy and swiftness from me.

Act 1, sc. 1.

In the same play, Almeria seeing a dead body, which she took to be Alphonso's, expresses sentiments strained and artificial, which nature suggests not to any person upon such an occasion.

See act 5, sc. 11.

5. Fanciful or finical sentiments. Sentiments that degenerate into point or conceit, however they may amuse in an idle hour, can never be the offspring of any serious or important passion. In the *Jerusalem of Tasso*, Tancred, after a single combat, spent with fatigue and loss of blood, falls into a swoon ; in which situation, understood to be dead, he is discovered by Erminia, who was in love with him to distraction. A more happy situation cannot be imagined to raise grief in an instant to the highest pitch ; and yet, in venting her sorrow, she descends most abominably into antithesis and conceit even of the lowest kind. See Canto 19, st. 105.

Armida's lamentation respecting her lover Ili-naldo is in the same vicious style. See Canto 20, st. 124, 125, 126.

Queen. Give me no help in lamentation ; I am not barren to bring forth complaints ; All springs reduce their currents to mine eyes, That I, being governed by the wat'ry moon, May send forth plenteous tears to drown the world, Ah for my husband, for my dear lord Edward.

King Richard III. act 2, sc. 2.

Jane Shore utters her last breath in a witty conceit :—

Then all is well, and I shall sleep in peace— 'Tis very dark, and I have lost you now— Was there not something I would have bequeath'd you ?

But I have nothing left me to bestow, Nothing but one sad sigh. Oh mercy, Heav'n !

[Dies.

Act 5.

Corneille, in his *Examen of the Cid*, answering an objection, that his sentiments are sometimes too much refined for persons in deep distress, observes that, if poets did not indulge sentiments more ingenious or refined than are prompted by passion, their performances would often be low, and extreme grief would never suggest but exclamations merely. This is to assert that forced thoughts are more agreeable than those that are natural, and ought to be preferred. 2. The second class is of sentiments that may belong to an ordinary passion, but are not perfectly concordant with it, as tainted by a singular character. In the last act of that excellent comedy *The Careless Husband*, Lady Easy, upon Sir Charles's reformation, is made to express more violent and turbulent sentiments of joy than are consistent with the mildness of her character. *Lady Easy.*—O the soft treasure ! O the dear reward of long desiring love.—Thus I thus to have you mine is something more than happiness ; 'tis double life, and madness of abounding joy.

3. The following instances are descriptions rather than sentiments, which compose a third class. Of this descriptive manner of painting the passions there is in the *Hippolytus* of Euripides, act 5, an illustrious instance, viz. the speech of Theseus, upon hearing of his son's dismal exit. In Racine's tragedy of *Esther*, the queen, hearing of the decree issued against her people, instead of expressing sentiments suitable to the occasion, turns her attention upon herself, and describes with accuracy her own situation. *Juste ciel ! tout mon sang dans mes veines se glace.* Act 1, sc. 3.

4. The fourth class is of sentiments expressed too early or too late. The following, from *Venice Preserved*, act 5, at the close of the scene between Belvidera and her father Priuli, is of this class. The account given by Belvidera of the danger she was in, and of her husband's threatening to murder her, ought naturally to have alarmed her relenting father, and to have made him express the most perturbed sentiments. Instead of which, he dissolves into tenderness and love for his daughter, as if he had already delivered her from danger, as if there were a perfect tranquillity :—

I'll henceforth be indeed a father ; never
Never more thus expose, but cherish thee,
Dear as the vital warmth that feeds my life,
Dear as those eyes that weep in fondness o'er thee :
Peace to thy heart.

5. Immoral sentiments exposed in their native colors, instead of being concealed or disguised, compose the fifth class. The *Lady Macbeth*, projecting the death of the king, has the following soliloquy :—

Come, all you spirits
That tread on mortal thoughts, unsex me here,
And fill me from the crown to the toe, top full
Of direct cruelty ; make thick my blood,
Stop up the access and passage to remorse,
That no compunctious visitings of nature
Shake my fell purpose. *Macbeth*, act 1, sc. 7.

This speech is not natural. A treacherous murder was never perpetrated even by the most hardened miscreant without compunction : and that the lady here must have been in horrible agitation appears from her invoking the infernal spirits to fill her with cruelty, and to stop up all avenues to remorse. But in that state of mind it is a never-failing artifice of self-deceit to draw the thickest veil over the wicked action, and to extenuate it by all the circumstances that imagination can suggest ; and, if the crime cannot bear disguise, the next attempt is to thrust it out of the mind altogether, and to rush on to action without thought. This last was the husband's method :—

Strange things I have in head, that will to hand ;
Which must be acted ere they must be scann'd.

Act 3, sc. 5.

The lady follows neither of these courses, but in a deliberate manner endeavours to fortify her heart in the commission of an execrable crime, without even attempting to color it. This, we think, is not natural ; we hope there is no such wretch to be found as is here represented. 6.

The last class comprehends sentiments that are unnatural, as being suited to no character nor passion. These may be subdivided into three branches :—1. Sentiments unsuitable to the constitution of man, and to the laws of his nature ; 2. inconsistent sentiments ; 3. sentiments that are pure rant and extravagance. When the fable is of human affairs, every event, every incident, and every circumstance, ought to be natural, otherwise the imitation is imperfect. But an imperfect imitation is a venial fault, compared with that of running cross to nature. In the *Hippolytus* of Euripides (act iv. sc. 5.) Hippolytus, wishing for another self in his own situation, 'How much,' says he, 'should I be touched with his misfortune !' as if it were natural to grieve more for the misfortune of another than for one's own.

Osmyn. Yet I beheld her—yet—and now no more.

Turn your light inward, eyes, and view my thought ;
So shall you still behold her—'Twill not be.
O impotence of sight ! &c.

Mourning Bride, act 2, sc. 8.

No man in his senses ever thought of applying his eyes to discover what passes in his mind ; far less of blaming his eyes for not seeing a thought or idea. In *Moliere's* *l'Avare* (act iv. sc. 7) Harpagon, being robbed of his money, seizes himself by the arm, mistaking it for that of the robber. This is so absurd as scarce to provoke a smile, if it be not at the author. Of the second branch the following example may suffice :—

—————Now bid me run,
And I will strive with things impossible,
Yea, get the better of them.

Julius Cæsar, act 2, sc. 3.

Of the third branch, take the following samples. Lucan, talking of Pompey's sepulchre, lib. vii. l. 798. According to Rowe's translation :—

Where there are seas, or air, or earth, or skies,
Wh'er Rome's empire stretches, Pompey lies.
If Fate decrees he must in Egypt lie,
Let the whole fertile realm his grave supply.
Yield the wide country to his awful shade,
Nor let us dare on any part to tread,
Fearful we violate the mighty dead !

This supposed omnipresence of Pompey's body is not only unnatural, but ridiculous. The following passages are pure rant. Coriolanus, speaking to his mother, says,

What is this ?
Your knees to me ? to your corrected son ?
Then let the pebbles on the hungry beach
Fillop the stars : then let the mutinous winds
Strike the proud cedars 'gainst the fiery sun :
Mur'd'ring impossibility, to make
What cannot be, slight work !

Coriolanus, act. 5, sc. 3.

Cæsar.—Danger knows full well,
That Cæsar is more dangerous than he,
We were two lions litter'd in one day,
And I the elder and more terrible.

Julius Cæsar, act. 2, sc. 4.

Ventidius. Fram'd in the very pride and boast of
nature
So perfect, that the gods who form'd you wonder'd
At their own skill, and cry'd, A lucky hit
Has mended our design. *Dryden. All for Love*, act .

Not to talk of the impiety of this sentiment, it is ludicrous instead of being lofty. The famous epitaph on Raphael is not less absurd than any of the foregoing passages :

Raphael, timuit, quo sospite, vincit,
Rerum magna parens, et moriente mori.

Imitated by Pope, in his epitaph on Sir Godfrey Kneller :

Living, great Nature fear'd he might outvie
Her works ; and dying fears herself may die.

Such is the force of imitation : for Pope of himself would never have been guilty of a thought so extravagant.

SENTIMENTAL, from sentiment. Of or belonging to sentiments, in the last sense of the primitive word. This adjective, though in very general use, seems to have been almost overlooked by the lexicographers, much as we daily hear of sentimental plays, toasts, songs, and even journeys. See **STERNE**. Applied to a person, it signifies the being endued with the most refined and delicate sentiments ; applied to a literary work, it implies that the work abounds with sentiments of that kind.

SENTINEL, *n. s.* Fr. *sentinelle* ; from Lat. *sentio*. One who watches or keeps guard.

Norfolk, hie thee to thy charge ;
Use careful watch, chuse trusty *sentinels*.

Shakspeare. Richard III.

Counsellors are not commonly so united, but that one counsellor keepeth *sentinel* over another, so that, if any do counsel out of faction or private ends, it commonly goes to the king's ear.

Bacon's Essays.

First, the two eyes, which have the seeing power,
Stand as one watchman, spy, or *sentinel*,

Being placed aloft, within the head's high tower ;
And, though both see, yet both but one thing tell.

DuVies.

Love to our citadel resorts,
Through those deceitful sally ports :
Our *sentinels* betray our forts.

Denham.

Perhaps they had *sentinels* waking while they slept ; but even this would be unsoldierlike.

Browne.

The senses are situated in the head, as *sentinels* in a watchtower, to receive and convey to the soul the impressions of external objects.

Ray on the Creation.

From afar

The watchdog bayed beyond the Tiber ; and
More near from out the Cæsar's palace came
The owl's long cry, and, interruptedly,
Of distant *sentinels* the fitful song

Began and died upon the gentle wind. *Byron.*

And, Sire, your limbs have need of rest,
And I will be the *sentinel*
Of this your troop. *Id.*

SENTINEL, or **SENTRY**, from the Latin *sentio*, or the Italian *sentinella*, a private soldier, placed in some post, to watch the approach of the enemy, to prevent surprises, and to stop such as would pass without order, or being discovered who they are. Sentries are placed before the arms of all guards, at the tents and doors of general officers, colonels of regiments, &c. All sentries are to be vigilant on their posts ; they are not, on any account, to sing, smoke tobacco, nor suffer any noise to be made near them. They are to have a watchful eye over the things

committed to their charge, not to suffer any light to remain, or any fire to be made near their posts in the night time ; neither is any sentry to be relieved, or removed from his post, but by the corporal of the guard. They are not to suffer any one to touch or handle their arms, or in the night time to come within ten yards of their post.

No person is to strike or abuse a sentry on his post ; but, when he has committed a crime, he is to be relieved, and then punished according to the rules and articles of war. A sentinel, on his post in the night, is not to know any body, but by the countersign ; when he challenges, and is answered, relief, he calls out stand, relief ; advance corporal ! upon which the corporal halts his men, and advances alone within a yard of the sentry's firelock, first ordering his party to port arms, on which the sentry does the same, and gives him the same countersign, taking care that no one hears it.

A **RUNNING SENTINEL** is a sentry who is upon the look out, at an advanced post, or near the gates of a fortified place, and is not confined to a particular spot.

SENTINEL PERDU, a soldier posted near an enemy, or in some very dangerous post where he is in hazard of being lost.

SENTINUM, an ancient town of Italy, in Umbria, Liv. x. c. 27 and 30.

SENTIUS (Cneius), a Roman historian, who flourished in the reign of Alexander Severus. He wrote the history of Alexander's life in Latin, or, as others say, in Greek.

SENTRY, or } Corrupted, I believe, from
SENTERY, *n. s.* } *sentinel*, says Johnson ; but
there is in Ital. *sentare*, and Span. *sentar*. A
watch ; sentinel ; one who watches in a garrison,
or army, to keep them from surprise.

If I do send, dispatch
Those *sentries* to our aid ; the rest will serve
For a short holding. *Shakspeare. Coriolanus.*

What strength, what art, can then
Suffice, or what evasion bear him safe
Through the strict *sentries*, and stations thick
Of angels watching round ! *Milton.*

Thou, whose nature cannot sleep,
O'er my slumbers *sentry* keep ;
Guard me 'gainst those watchful foes,
Whose eyes are open while mine close. *Browne.*

The youth of hell strict guard may keep,
And set their *sentries* to the utmost deep. *Dryden.*

One goose they had, 'twas all they could allow,
A wakeful *sentry*, and on duty now. *Id.*

Here toils and death, and death's half-brother,
sleep,
Forms terrible to view, their *sentry* keep. *Id.*

SEPARATE, *v. a., v. n., &c.* Fr. *separer* ;
SEPARABILITY, *n. s.* [*adj.* Lat. *separo*. To
SEPARABLE, *adj.* break ; divide
SEPARABLENESS, *n. s.* into parts ; se-
SEPARATELY, *adv.* ver ; set apart ;
SEPARATENESS, *n. s.* withdraw : as a
SEPARATION, verb neuter, to
SEPARATIST, part ; be divid-
SEPARATOR, ed : as an ad-
SEPARATORY, *adj.* jective, divid-
ed ; disjointed ; secluded ; disunited ; disengaged
from body or matter : separability is the quality
of admitting disunion or division : separable,

divisible; possible to be disjoined from something else; the noun substantive corresponding: separately, separateness, and separation, follow the sense of separate as an adjective: a separatist is one who separates; a schismatic: separator, one who divides or makes a separation: separatory, used in, or conducive to, separation.

Separate thyself from me: if thou wilt take the left, I will go to the right. *Gen. xiii. 9.*

David *separated* to the service those who should prophesy. *1 Chron. xxv. 1.*

Separate me Barnabas and Saul, for the work whereunto I have called them. *Acts xiii. 2.*

I'll to England.

—To Ireland, I: our *separated* fortunes
Shall keep us both the safer. *Shakspeare. Macbeth.*

Did you not hear

A buzzing of a *separation*
Between the king and Catharine? *Shakspeare.*

It is of singular use to princes, if they take the opinions of their council both *separately* and together: for private opinion is more free, but opinion before others is more reserved. *Bacon.*

As the confusion of tongues was a mark of *separation*, so the being of one language was a mark of union. *Id.*

A fifteenth part of silver, incorporate with gold, will not be recovered by any matter of *separation*, unless you put a greater quantity of silver, which is the last refuge in *separations*. *Id.*

The anabaptists', *separatists'*, and sectaries' tenets are full of schisms, and inconsistent with monarchy. *Id.*

They have a dark opinion that the soul doth live after the *separation* from the body. *Abbot.*

Our modern *separatists* pronounce all those heretical, or carnal, from whom they have withdrawn.

Decay of Piety.

Death from sin no power can *separate*. *Milton.*

Eve *separate* he wished. *Id.*

Separability is the greatest argument of real distinction. *Glanville.*

Trials permit me not to doubt of the *separableness* of a yellow tincture from gold. *Boyle.*

Can a body be inflammable, from which it would puzzle a chemist to *separate* an inflammable ingredient? *Id.*

In a secret vale the Trojan sees
A *separate* grove. *Dryden.*

If you admit of many figures, conceive the whole together; and not every thing *separately* and in particular. *Id.*

Expansion and duration have this farther agreement, that though they are both considered by us as having parts, yet their parts are not *separable* one from another. *Locke.*

When there was not room enough for their herds to feed, they by consent *separated*, and enlarged their pasture. *Id.*

Whatever ideas the mind can receive and contemplate without the help of the body, it can retain without the help of the body too, or else the soul, or any *separate* spirit, will have but little advantage by thinking. *Id.*

The greatest argument of real distinction is *separability* and actual *separation*; for nothing can be *separated* from itself. *Norris.*

'Twere hard to conceive an eternal watch whose pieces were never *separate* one from another nor ever in any other form. *Burnet's Theory of the Earth.*

Says the *separatist*, if those who have the rule over you should command you any thing about church

affairs you ought not, in conscience, to obey them.

South's Sermons.

Earths are opaque, insipid, and, when dried, friable, or consisting of parts easy to *separate*, and soluble in water; not disposed to burn, flame, or take fire. *Woodward.*

The infusions and decoctions of plants contain the most *separable* parts of the plants, and convey not only their nutritious but medicinal qualities into the blood. *Arbuthnot.*

The most conspicuous gland of an animal is the system of the guts, where the lacteals are the emissary vessels, or *separatory* ducts.

Cheyne's Philosophical Principles.

SEPHARVAIM, or SEPHARVITES, a tribe of the Samaritans, supposed by Calmet to be originally the Sapires on the north of Media; but by Dr. Gill natives of Sipporhæ in Syro-Phœnicia. They were partly cut off by the Assyrians; and the rest were transplanted into the land of Israel, after the overthrow of that kingdom, and the captivity of the ten tribes.

SEPIA, the cuttle-fish, or ink-fish, a genus belonging to the order of vermes mollusca. There are eight brachia interspersed on the interior side with little round serrated cups, by the contraction of which the animal lays fast hold of any thing. Besides these eight arms, it has two tentacula longer than the arms, and frequently pendunculated. The mouth is situated in the centre of the arms, and is horny and hooked, like the bill of a hawk. The eyes are below the tentacula, towards the body of the animal. The body is fleshy, and received into a sheath as far as the breast. Their food are tunnies, sprats, lobsters, and other shell fish. With their arms and trunks they fasten themselves, to resist the motion of the waves. Their beak is like that of a parrot. The females are distinguished by two paps. They copulate as the polypi do, by a mutual embrace, and lay their eggs upon seaweed and plants, in parcels like bunches of grapes. Immediately after they are laid they are white, and the males pass over and impregnate them with a black liquor, after which they grow larger. On opening the egg, the embryo-cuttle is found alive. The males are very constant, accompany their females every where, face every danger in their defence, and rescue them intrepidly at the hazard of their own lives. The timorous females fly as soon as they see the males wounded. The noise of a cuttle-fish, on being dragged out of the water, resembles the grunting of a hog. When the male is pursued by the sea-wolf or other ravenous fish, he shuns the danger by stratagem. He squirts his black liquor, sometimes to the quantity of a dram, by which the water becomes black as ink, under shelter of which he baffles the pursuit of his enemy. This ink or black liquor has been denominated by M. le Cat æthiops animal, and is reserved in a particular gland. In its liquid state it resembles that of the choroid in man; and would then communicate an indelible dye; when dry, it might be taken for the product of the black liquor in negroes dried, and made a precipitate by spirit of wine. This æthiops animal in negroes, as well as in the cuttle-fish, is more abundant after death than even during life. It may serve either for

writing or printing; in the former of which ways the Romans used it. It is said to be an ingredient in the composition of Indian ink mixed with rice. There are five species:—1. *S. loligo*, the great cuttle, with short arms and long tentacula; the lower part of the body rhomboid and pinnated, the upper thick and cylindric. They inhabit all our seas, where, having blackened the water by the effusion of their ink, they abscond, and with their tail leap out of the water. They are gregarious, and swift in their motions: they take their prey by means of their arms, and, embracing it, bring it to their central mouth. They adhere to the rocks, when they wish to be quiescent, by means of the concave discs placed along their arms. 2. *S. media*, the middle cuttle, with a long slender cylindric body, tail finned, pointed, and carinated on each side; two long tentacula; the body almost transparent green, but convertible into a dirty brown; confirming the remark of Pliny, that they change their color through fear, adapting it, chameleon-like, to that of the place they are in. The eyes are large and smaragdine. 3. *S. octopodia*, the eight-armed cuttle. The arms are connected at their bottom by a membrane. This is the polypus of Pliny, which he distinguishes from the *loligo* and *sepiä* by the want of the tail and tentacula. They inhabit our seas, but abound most in the Mediterranean. In hot climates these are found of an enormous size. The Indians affirm that some have been seen two fathoms broad over their centre, and each arm nine fathoms long. When the Indians navigate their little boats they go in dread of them; and, lest these animals should fling their arms over and sink them, they never sail without an axe to cut them off. When used for food they are served up red from their own liquor, which, from boiling with the addition of nitre, becomes red. Barthol says, upon cutting one of them open, so great a light broke forth, that at night, upon taking away the candle, the whole house seemed to be in a blaze. 4. *S. officinalis*, the officinal cuttle, with an ovated body, has fins along the whole of the sides, almost meeting at the bottom; and two long tentacula. The body contains the bone, the cuttle-bone of the shops, which was formerly used as an absorbent. The bones are frequently flung on all our shores; the animal very rarely. The conger eels bite off their arms or feet; but they grow again, as does the lizard's tail (Plin. ix. 20). They are preyed upon by the plaice. This fish emits (in common with the other species), when frightened or pursued, the black liquor which the ancients supposed darkened the circumambient wave, and concealed it from the enemy. The ancients sometimes made use of it instead of ink. Persius mentions this species in his description of the noble student. This animal was esteemed a delicacy by the ancients, and is eaten even at present by the Italians. Rondeletius gives us two receipts for the dressing. Athenæus also gives the method of making an antique cuttle-fish sausage; and we learn from Aristotle that these animals are in highest season when pregnant. 5. *S. sepiola*, the small cuttle, with a short body rounded at the bottom, has a round fin on each

side and two tentacula. They are taken off Flintshire, but chiefly inhabit the Mediterranean.

SEPIARIÆ (from *sepes*, a hedge), the name of the forty-fourth order of Linnæus's Fragments of a Natural Method, consisting of a beautiful collection of woody plants, some of which, from their size and elegance, are very proper furniture for hedges. See BOTANY, Index.

SEPIAS, in ancient geography, a cape of Thessaly, now called St. George.

SEPS, in zoology. See LACERTA.

SEPT, *n. s.* Fr. *cep*; Lat. *septum*. A clan; race; family; generation. A word used chiefly with regard or allusion to Ireland.

This judge, being the lord's brehon, adjudgeth a better share unto the lord of the soil, or the head of that *sept*, and also unto himself for his judgment a greater portion, than unto the plaintiffs.

Spenser on Ireland.

The English forces were ever too weak to subdue so many warlike nations, or *septs* of the Irish, as did possess this island.

Davies on Ireland.

The true and ancient Russians, a *sept* whom he had met with in one of the provinces of that vast empire, were white like the Danes.

Boyle.

SEPTARIÆ, in the old system of mineralogy, a large class of fossils, named also *ludus Helmontii* and *waxen veins*. They were defined to be fossils not inflammable, nor soluble in water; of a moderately firm texture and dusky hue, divided by several septa or thin partitions, and composed of a sparry matter greatly debased by earth; not giving fire with steel; fermenting with acids, and in great part dissolved by them; and calcining in a moderate fire. Of this class were reckoned two distinct orders of bodies, and under these six genera. The first order were those which are usually found in large masses, of a simple uniform construction, but divided by large septa either into larger and more irregular portions, or into smaller and more equal ones called *talc*. The genera of this order are four: 1. Those divided by septa of spar, called *secomiæ*. 2. Those divided by septa of earthy matter, called *gaiophragmia*. 3. Those divided by septa of the matter of the pyrites, called *pyritercia*. And, 4. Those divided by septa of spar, with an admixture of crystal, called *diagophragmia*. Those of the second order are such as are usually found in smaller masses, of a crustated structure, formed by various incrustations round a central nucleus, and divided by a very thin septa. Of this order were only two genera: 1. Those with a short roundish nucleus, enclosed within the body of the mass; and, 2. Those with a long nucleus, standing out beyond the ends of the mass.

SEPTAS, in botany, a genus of plants belonging to the order of heptagynia, and the class of heptandria; natural order thirteenth, succulentæ: CAL. divided into seven parts; the petals are seven; the germens seven: CAPS. also seven, and contain many seeds. There is only one species, viz.

S. Capensis, which is a native of the Cape of Good Hope, is round-leaved, and flowers in August and September.

SEPTEM [Lat.], seven, forms part of the names of some ancient places: as *Septem Aquæ*,

a lake near Reate, in Italy. Cic. 4. Att. 15. Septem Aquæ Mariæ, the entrance of the seven mouths of the Po into the Adriatic. Septem Fratres [q. d. Seven Brethren], a mountain of Mauritania, with seven summits; now called Gebel or Gebel Mousa.

SEPTEMBER, *n. s.* Fr. *Septembre*; Lat. *September*. The ninth month of the year; the seventh from March.

September hath his name as being the seventh month from March: he is drawn with a merry and cheerful countenance in a purple robe.

Peacham on Drawing.

SEPTEMBER consists of only thirty days; it took its name as being the seventh month from March, with which the Romans began their year.

SEPTEMBRISERS [Fr. *Septembriseurs*], a name invented to stigmatise those bloody Parisians, who, in September 1792, went to the state prisons, and, without trial by judges or juries, massacred most of the prisoners who were confined in them.

SEPTENNIAL, *adj.* Lat. *septennis*. Lasting seven years; happening once in seven years.

Being once dispensed with for his *septennial* visit, by a holy instrument from Petropolis, he resolved to govern them by subaltern ministers.

Houel's Vocal Forest.

The days of men are cast up by *septenaries*, and every seventh year conceived to carry some altering character in temper of mind or body.

Browné's Vulgar Errours.

These constitutions of Moses, that proceed so much upon a *septenary*, or number of seven, have no reason in the nature of the thing.

Burnet.

Every controversy has seven questions belonging to it; though the order of nature seems too much neglected by a confinement to this *septenary* number.

Watts.

SEPTENNIAL ELECTIONS. Blackstone, in his *Commentaries*, vol. i. p. 189, says (after observing that the utmost extent of time allowed the same parliament to sit by the stat. 6 W. & M. c. 2, was three years), 'But by the statute 1 Geo. I. st. 2. c. 38 (in order professedly to prevent the great and continued expenses of frequent elections, and the violent heats and animosities consequent thereupon, and for the peace and security of the government, just [then recovering from the late rebellion], this term was prolonged to seven years; and, what alone is an instance of the vast authority of parliament, the very same house that was chosen for three years enacted its own continuance for seven.'

SEPTETRIO, in astronomy, a constellation more usually called *ursa minor*.

SEPTETRION, *n. s.* & *adj.* } Fr. *septen-*
SEPTE'TRIONALLY, *adv.* } *trion*; Lat.
SEPTE'TRIONATE, *v. n.* } *septentrio*.

The north: northerly: to send northerly.

Thou art as opposite to every good

As the antipodes are unto us,

Or as the south to the *septentrio*.

Shakspeare. Henry VI.

Backed with a ridge of hills,

That screened the fruits of the earth and seats of men

From cold *septentrio* blasts.

Milton's Paradise Regained.

If they be powerfully excited, and equally let fall, they commonly sink down, and break the water, at

that extreme wherent they were *septentrionally* excited.

Browné.

Steel and good iron, never excited by the loadstone, *septentrionate* at one extreme, and *australise* at another.

Id.

If the spring

Proceeding should be destitute of rain,

Or blast *septentrional* with brushing wings

Sweep up the smoky mists and vapours damp,

Then woe to mortals!

Phillips.

SEPTE'RION, a festival observed once in nine years in honor of Apollo. It was a representation of his victory over Python. See **PYTHON**.

SEPTFOIL [from Lat. *septem* and *folia*, q. d. seven leaves], the English name of a species of tormentilla.

SEPTICAL, *adj.* Gr. *σηπτικός*. Having power to promote or produce putrefaction.

As a *septic* medicine Galen commended the ashes of a salamander.

Browné's Vulgar Errours.

SEPTICS, substances which promote putrefaction, chiefly the calcareous earths, magnesia, and testaceous powders. From many curious experiments made by Sir John Pringle, to ascertain the septic and antiseptic virtues of natural bodies, it appears that there are very few substances of a truly septic nature. Those commonly reputed such by authors, as the alkaline and volatile salts, he found to be no wise septic. However, he discovered some, where it seemed least likely to find any such quality; these were chalk, common salt, and testaceous powders. He mixed twenty grains of crabs' eyes, prepared with six drams of ox's gall, and an equal quantity of water. Into another phial he put an equal quantity of gall and water, but no crabs' eyes. Both these mixtures being placed in the furnace, the putrefaction began much sooner where the powder was than in the other phial. On making a like experiment with chalk, its septic virtue was found to be much greater than that of the crabs' eyes: nay, what the doctor had never met with before, in a mixture of two drams of flesh with two ounces of water and thirty grains of prepared chalk, the flesh was resolved into a perfect mucus in a few days. To try whether the testaceous powders would also dissolve vegetable substances, the doctor mixed them with barley and water, and compared this mixture with another of barley and water alone. After a long maceration by a fire, the plain water was found to swell the barley, and turn mucilaginous and sour; but that with the powder kept the grain to its natural size, though it softened it, yet made no mucilage and remained sweet. Nothing could be more unexpected than to find sea salt a hastener of putrefaction; but the fact is thus: one dram of salt preserves two drams of fresh beef, in two ounces of water, above thirty hours uncorrupted, in a heat equal to that of the human body; or, which is the same thing, this quantity of salt keeps flesh sweet twenty hours longer than pure water; but then half a dram of salt does not preserve it above two hours longer; twenty-five grains have little or no antiseptic virtue, and ten, fifteen, or even twenty grains, manifestly both hasten and heighten the corruption. The quantity which had the most putrefying

quality, was found to be about ten grains to the above proportion of flesh and water. Many inferences might be drawn from this experiment: one is, that since salt is never taken in aliment beyond the proportion of the corrupting quantities, it would appear that it is subservient to digestion chiefly by its septic virtue, that is, by softening and resolving meats; an action very different from what is commonly believed. The above experiments were made with the salt kept for domestic uses. See Pringle on the Diseases of the Army, p. 348, et seq.

SEPTILATERAL, *adj.* Lat. *septem* and *latus*. Having seven sides.

By an equal interval they make seven triangles, the bases whereof are the seven sides of a *septilateral* figure, described within a circle.

Browne's Vulgar Errors.

SEPTIMIUS (Titus), a Roman knight, celebrated for his poems, both tragic and lyric. He was intimate with the emperor Augustus, and the poet Horace, who addressed the sixth ode of his second book to him.

SEPTIZON, or **SEPTIZONIUM**, in Roman antiquity, a celebrated mausoleum, built by Septimius Severus, in the tenth region of the city of Rome: it was so called from *septem* and *zona*, by reason it consisted of seven stories, each of which was surrounded by a row of columns.

SEPTUAGINT, *n. s.* Lat. *septuaginta*. The old Greek version of the Old Testament, so called as being supposed the work of seventy-two interpreters. See below.

The three hundred years of John of times, or Nestor, cannot afford a reasonable encouragement beyond Moses's *septuagenary* determination.

Browne's Vulgar Errors.

In our abridged and *septuagesimal* age, it is very rare to behold the fourth generation. *Id.*

Which way soever you try you shall find the product great enough for the extent of this earth; and, if you follow the *Septuagint* chronology, it will still be far higher. *Burnet.*

The **SEPTUAGINT** is said to be the work of seventy-two Jews, who are usually called the seventy interpreters, because seventy is a round number. The history of this version was expressly written by Aristæas, an officer of the guards to Ptolemy Philadelphus. The substance of his account is as follows:—Ptolemy having erected a fine library at Alexandria, which he took care to fill with the most curious and valuable books from all parts of the world, was informed that the Jews had one containing the laws of Moses, and the history of that people; and, being desirous of enriching his library with a Greek translation of it, applied to the high-priest of the Jews; and, to engage him to comply with his request, set at liberty all the Jews whom his father Ptolemy Soter had reduced to slavery. After such a step he easily obtained what he desired; Eleazar the Jewish high-priest sent back his ambassadors with an exact copy of the Mosaic law, written in letters of gold, and six elders of each tribe, in all seventy-two, who were received with marks of respect by the king, and then conducted into the Isle of Pharos, where they were lodged in a house prepared for their reception, and supplied with every thing necessary. They set about the translation without

loss of time, and finished it in seventy-two days, and, the whole being read in the presence of the king, he admired the profound wisdom of the laws of Moses, and sent back the deputies laden with presents, for themselves, the high-priest, and the temple. Aristobulus, who was tutor to Ptolemy Physcon; Philo, who lived in our Saviour's time, and was contemporary with the apostles; and Josephus, speak of this translation as made by seventy-two interpreters, by the care of Demetrius Phalareus, in the reign of Ptolemy Philadelphus. All the Christian writers, during the first fifteen centuries of the Christian era, have admitted this account of the Septuagint as an undoubted fact. But, since the Reformation, critics have boldly called it in question, because it was attended with circumstances which they think inconsistent or improbable. Du Pin has asked, why were seventy-two interpreters employed, since twelve would have been sufficient? Such an objection is trifling. We may as well ask, why did king James I. employ fifty-four translators in rendering the Bible into English, since twelve, or even two, might have been sufficient? 1. Prideaux objects that the Septuagint is not written in the Jewish, but in the Alexandrian dialect, and could not therefore be the work of natives of Palestine. But these dialects were probably at that time the same; for both Jews and Alexandrians had received the Greek language from the Macedonians about fifty years before. 2. Prideaux farther contends that all the books of the Old Testament could not be translated at the same time; for they exhibit great difference of style. To this it is sufficient to reply that they were the work of seventy-two men, each of whom had separate portions assigned him. 3. The dean also urges that Aristæas, Aristobulus, Philo, and Josephus, all directly tell us that the law was translated without mentioning any of the other sacred books. But nothing was more common among writers of the Jewish nation than to give this name to the Scriptures as a whole. In the New Testament *law* is used as synonymous with what we call the Old Testament. Besides, it is expressly said by Aristobulus, in a fragment quoted by Eusebius (Præp. Evan. l. 1), that the whole sacred Scripture was rightly translated through the means of Demetrius Phalareus, and by the command of Philadelphus. Josephus indeed, says the learned dean, asserts, in the preface of his Antiquities, that the Jewish interpreters did not translate for Ptolemy the whole Scriptures, but the law only. Here the evidence is contradictory, and we have only to enquire whether Aristobulus or Josephus had the best opportunity of knowing the truth. Aristobulus was an Alexandrian Jew, tutor to an Egyptian king, and lived within 100 years after the translation was made, and certainly had access to see it in the royal library. Josephus was a native of Palestine, and lived not until 300 years or more after the translation was made, and many years after it was burnt, along with the whole library of Alexandria, in the wars of Julius Cæsar. Supposing the veracity of these two writers equal, as we have no proof of the contrary, which of them ought we to consider as the best evidence? Aristobulus surely. If the writings which have passed under his name were

a forgery of the second century, it is surprising that they should have imposed upon Clemens Alexandrinus, who lived in the same century, and was a man of abilities, learning, and well acquainted with the writings of the ancients. Eusebius, too, in his *Præp. Evan.*, quotes the commentaries of Aristobolus. And in answer to the dean's objections, that neither Philo nor Josephus have quoted Aristobolus, it is sufficient to observe that it was not the uniform practice of these times to name the authors from whom they derived their information. 4. Prideaux farther contends that the sum which Ptolemy is said to have given to the interpreters is too great to be credible. If his computation were just, it certainly would be so. He makes it £2,000,000 sterling; but Dr. Blair reduces it to £85,421, and others to £56,947; neither of which is a sum so very extraordinary in so great and magnificent a prince as Philadelphus, who spent, according to a passage in Athenæus, lib. v., no less than 10,000 talents on the furniture of one tent; which is six times more than what was spent in the whole of the embassy and translation, which amounted only to 1552 talents. 5. Prideaux says, that which convicts the whole story of Aristæus of falsity is, that he makes Demetrius Phalæreus to be the chief actor in it, and a great favorite of the king; whereas Philadelphus, as soon as his father was dead, cast him into prison, where he soon after died. But it is replied that Philadelphus reigned two years jointly with his father Lagus; and it is not said by Hieronymus that Demetrius was out of favor with Philadelphus during his father's life. Now, if the Septuagint was translated in the beginning of the reign of Philadelphus, as Eusebius and Jerome think, the difficulty will be removed. Demetrius might have been librarian during the reign of Philadelphus, and yet imprisoned on the death of Lagus. Indeed, as the cause of Philadelphus's displeasure was the advice which Demetrius gave to his father, to prefer the sons of Arsinoë before the son of Berenice, he could scarcely show it till his father's death. The Septuagint translation might therefore be begun while Philadelphus reigned jointly with his father, but not be finished till after his father's death. 6. Besides the above objections, there is only one more that deserves notice. The ancient Christians not only differ from one another concerning the time in which Aristobolus lived, but even contradict themselves in different parts of their works. Sometimes they tell us he dedicated his book to Ptolemy Philometer, at other times they say it was addressed to Philadelphus and his father. Sometimes they make him the same person who is mentioned in 2 Maccabees, chap. i., and sometimes one of the seventy-two interpreters, 152 years before. It is difficult to explain how authors fall into such inconsistencies; but it is probably occasioned by their quoting from memory. This was certainly the practice of almost all the early Christian writers, and sometimes of the apostles themselves. Mistakes were therefore inevitable. Josephus has varied in the circumstances of the same event, in his *Antiquities* and *Wars of the Jews*, probably from the same cause; but we do not hence conclude that every circumstance of such a relation is entirely false. In the account

of the marquis of Argyle's death, in the reign of Charles II., we have a very remarkable contradiction. Lord Clarendon relates that he was condemned to be hanged, which was performed the same day: on the contrary, Burnet, Woodrow, Heath, and Echard, concur in stating that he was beheaded; and that he was condemned upon the Saturday and executed upon the Monday. Was any reader of English history ever sceptic enough to raise from hence a question, whether the marquis of Argyle was executed or not? Yet this ought to be left in uncertainty, according to the way of reasoning in which the facts respecting the translation of the Septuagint are attempted to be disproved. Such are the objections which the learned and ingenious Prideaux has raised against the common account of the Septuagint translation, and such are the answers which may be given to them. We support that opinion which is sanctioned by historical evidence, in preference to the conjectures of modern critics, however ingenious; being persuaded that there are many things recorded in history which, though perfectly true, yet, from our imperfect knowledge of the concomitant circumstances, may, at a distant period, seem liable to objections. To those who require positive evidence, it may be stated thus: Aristæus, Aristobolus, Philo, and Josephus, assure us that the law was translated. Taking the law in the most restricted sense, we have at least sufficient authority to assert that the Pentateuch was rendered into Greek under Ptolemy Philadelphus. Aristobolus affirms that the whole Scriptures were translated by the seventy-two. Josephus confines their labors to the books of Moses. He therefore who cannot determine which of the two is the most respectable, may suspend his opinion. It is certain, however, that many of the other books were translated before the age of our Saviour; for they are quoted both by him and his apostles; and, perhaps, by a minute examination of ancient authors, in the same way that Dr. Lardner has examined the Christian fathers to prove the antiquity of the New Testament, the precise period in which the whole books of the Septuagint were composed might, with considerable accuracy, be ascertained. For 400 years this translation was in high estimation with the Jews. It was read in their synagogues in preference to the Hebrew; not only in those places where Greek was the common language, but in many synagogues of Jerusalem and Judea. But, when they saw that it was equally valued by the Christians, they became jealous of it; and at length, in the second century, Aquila, an apostate Christian, attempted to substitute another Greek translation in its place. In this work he was careful to give the ancient prophecies concerning the Messiah a different turn from the Septuagint, that they might not be applicable to Christ. In the same design he was followed by Symmachus and Theodotion, who also, as St. Jerome informs us, wrote out of hatred to Christianity. In the mean time the Septuagint, from the ignorance, boldness, and carelessness of transcribers, became full of errors. To correct these, Origen published a new edition in the beginning of the third century, in which he placed the translations of Aquila, Symmachus, and Theodotion. This edi-

was called Tetrapla; the translations being arranged opposite to one another in four columns. He also added one column, containing the Hebrew text in Hebrew letters, and another exhibiting it in Greek. In a second edition he published two additional Greek versions; one of which was found at Nicopolis, and the other at Jericho; this was called the Hexapla. By comparing so many translations, Origen endeavoured to form a correct copy of the Scriptures. Where they all agreed, he considered them as right. The passages which he found in the LXX., but not in the Hebrew text, he marked with an obelisk: what he found in the Hebrew, but not in the LXX., he marked with an asterisk. St. Jerome says that the additions which Origen made to the LXX., and marked with an asterisk, were taken from Theodotion. From this valuable work of Origen, the version of the LXX. was transcribed in a separate volume, with the asterisks and obelisks, for the use of the churches; and from this circumstance the great work itself was neglected and lost. About the year 300 two new editions of the LXX. were published; the one by Hesychius an Egyptian bishop, and the other by Lucian a presbyter of Antioch. But, as these authors did not mark with any note of distinction the alterations which they had made, their editions do not possess the advantages of Origen's. The best edition of the LXX. is that of Dr. Grabe, which was published in the beginning of the last century. He had access to two MSS., nearly of equal antiquity, the one found in the Vatican library at Rome, the other in the Royal library at St. James's, which was presented to Charles I. by Cyril, patriarch of Alexandria, and hence it is commonly called the Alexandrian MS. Anxious to discover which of these was according to the edition of Origen, Dr. Grabe collected the fragments of the Hexapla, and found they agreed with the Alexandrian MS., but not with the Vatican, where it differed with the other. Hence he concluded that the Alexandrian MS. was taken from the edition of Origen. By comparing the quotations from Scripture in the works of Athanasius and St. Cyril, who were patriarchs of Alexandria at the time St. Jerome says Hesychius' edition of the LXX. was there used, with the Vatican MS., he found they agreed so well that he justly inferred that that MS. was taken from the edition of Hesychius. This version was in use to the time of our blessed Saviour, and is that out of which most of the citations in the New Testament from the Old are taken. It was also the ordinary and canonical translation made use of by the Christian church in the earliest ages; and it still subsists in the churches both of the east and west. Those who desire a more particular account of the Septuagint translations may consult Hody de Bibliorum Textibus, Prideaux's Connections, Owen's Enquiry into the Septuagint Version, Blair's Lectures on the Canon, and Michaelis's Introduction to the New Testament, last edition.

SEPTUAGINT CHRONOLOGY, the chronology which is formed from the dates and periods of time mentioned in the Septuagint translation of the Old Testament. It reckons 1500 years more

VOL. XXX.

from the creation to Abraham than the Hebrew Bible. Dr. Kennicot, in the dissertation prefixed to his Hebrew Bible, has shown it to be very probable that the chronology of the Hebrew Scriptures, since the period just mentioned, was corrupted by the Jews, between the year 178 and 200, and that the chronology of the Septuagint is more agreeable to truth. It is a fact, that during the second and third centuries the Hebrew Scriptures were almost entirely in the hands of the Jews, while the Septuagint was confined to the Christians. The Jews had therefore a very favorable opportunity for this corruption. The following is the reason which is given by oriental writers: it being a very ancient tradition that the Messiah was to come in the sixth chiliad, because he was to come in the last days (founded on a mystical application of the six days' creation), the contrivance was to shorten the age of the world from about 5500 to 3760: and thence to prove that Jesus could not be the Messiah. Dr. Kennicot adds that some Hebrew copies having the larger chronology were extant till the time of Eusebius, and some till the year 700.

SEPTUM, in anatomy, an enclosure or partition; a term applied to several parts of the body, which serve to separate one part from another; as, septum narium, or partition between the nostrils, &c.

SEPTUM LUCIDUM, *See* ANATOMY.

SEPULCHRE, *n. s.* & *Fr. sepulchre*;
SEPULCHRAL, *adj.* [*v. a.*] *Lat. sepulchrum*. A
SEPULTURE, *n. s.* grave; tomb; to
 entomb; bury: sepulture is, burial; interment.

His miracles, and our redemption, wrought;
 Where I, by thee inspired, *he* praises sung,
 And on his sepulchre my offering hung. *Sandys.*

To entail him and 's heirs unto the crown,
 What is it but to make thy sepulchre?
Shakespeare. Henry VI.

Go to thy lady's grave, and call her thence:
 Or, at the least, in hers sepulchre thine. *Shakespeare.*

Flies and spiders get a sepulchre in amber more
 durable than the monument and embalming of any
 king. *Bacon.*

Whilst our souls negotiate there,
 We like sepulchral statues lay;
 All day the same our postures were,
 And we said nothing all the day. *Donne.*

I am glad to see that time survive,
 Where merit is not sepulchred alive;
 Where good men's virtues them to honours bring,
 And not to dangers. *Ben Jonson*

Perpetual lamps for many hundred years have
 continued burning, without supply, in the sepulchres
 of the ancients. *Wilkins.*

Mine eye hath found that sad sepulchral rock,
 That was the casket of heaven's richest store.
Milton.

Thou so sepulchred in such pomp dost lie,
 That kings for such a tomb would wish to die. *Id.*

That Niobe, weeping over her children, was turned
 into a stone, was nothing else but that during that
 life she erected over her sepulture a marble tomb of
 her own. *Bacon.*

If not one common sepulchre contains
 Our bodies, or one *in* our last remains,
 Yet *Ce* *we* *shall* *join*. *Dryden.*
 F

Where we may royal *sepulture* prepare ;
With speed to Meselinda bring relief,
Recal her spirits and moderate her grief. *Id.*

In England *sepulture*, or burial of the dead, may be deferred and put off for the debts of the person deceased. *Ayliffe.*

Disparted streams shall from their channels fly,
And, deep surcharged, by sandy mountains lie
Obscurely *sepulchred*. *Prior.*

Sepulchral lies our holy walls to grace,
And new-year odes. *Pope's Dunciad.*

SEPULCHRE is chiefly used in speaking of the burying places of the ancients, those of the moderns being usually called tombs. Sepulchres were held sacred and inviolable; and the care taken of them has always been held a religious duty, grounded on the fear of God, and the belief of the soul's immortality. Those who have searched or violated them have been thought odious by all nations, and were always severely punished. The Egyptians called sepulchres eternal houses, in contradistinction to their ordinary houses or palaces, which they called inns, on account of their short stay in the one in comparison of their long abode in the other. — See **TOMB**.

SEPULCHRE, KNIGHTS OF THE HOLY, a military order, established in Palestine about the year 1114. The knights of this order in Flanders chose Philip II., king of Spain, for their master, in 1558, and afterwards his son; but the grand-master of the order of Malta prevailed on the last to resign; and, when afterwards the duke of Nevers assumed the same quality in France, the same grand-master by his interest and credit procured a like renunciation of him, and a confirmation of the union of this order to that of Malta.

SEPULCHRE, REGULAR CANONS OF ST., a religious order, formerly instituted at Jerusalem, in honor of the holy sepulchre, or the tomb of Jesus Christ. Many of these canons were brought from the Holy Land into Europe, particularly into France, by Louis the Younger; into Poland, by Jaxa, a Polish gentleman; and into Flanders, by the counts thereof; many also came into England. This order was, however, suppressed by Pope Innocent VIII., who gave its revenues and effects to that of our Lady of Bethlehem; which also becoming extinct, they were bestowed on the knights of St. John of Jerusalem. But the suppression did not take effect in Poland, where they still subsist, as also in several provinces of Germany. These canons follow the rule of St. Augustine.

SEPULVEDA (John Genes de), a Spanish writer, born at Cordova in 1491. He became chaplain and historiographer to the emperor Charles V.; and wrote *A Vindication of the Cruelties of the Spaniards against the Indians*; and other works. He died at Salamanca, in 1572.

SEQUACIOUS, *adj.* } Lat. *sequax*. Duct-
SEQUACITY, *n. s.* } tile; pliant; ductility;
toughness.

Matter whereof creatures are produced, hath a closeness, lensor, and *sequacity*.

Bacon's Natural History.
Orpheus could lead the savage race,
And trees uprooted left their place,

Sequacious of the lyre :
But bright Cecilia raised the wonder higher ;
When to her organ vocal breath was given,
An angel heard,
And straight appeared,
Mistaking earth for heaven. *Dryden.*

In the greater bodies the forge was easy, the matter being ductile and *sequacious*, and obedient to the hand and stroke of the artificer, and apt to be drawn, formed or moulded. *Ray.*

Above those superstitious horrors that enslave
The fond *sequacious* herd, to mystick faith
And blind amazement prone, the' enlightened few
The glorious stranger hail. *Thomson.*

SEQUANA, a river of ancient Gaul, which separated the territories of the Belgæ and the Celtæ. It is now called the Seine. Strabo 4, Mela iii. 2, Lucan i. v. 425.

SEQUANI, a people anciently inhabiting a part of Gallia Celtica, annexed to Belgica by Augustus, separated from the Helvetii by Mount Jura, with the Rhine on the east (Strabo), bordering on the Ædui, and Segustiano to the south, and Lingones to the west (Tacitus). It was lately called *FRANCHE COMTE*. See that article.

SEQUEL, *n. s.* Fr. *sequelle*; Lat. *sequela*. Conclusion; succeeding part.

Let any principal thing, as the sun or the moon, but once cease, fail or swerve, and who doeth not easily conceive that the *sequel* thereof would be ruin both to itself and whatsoever dependeth on it?

Hooker.
What *sequel* is there in this argument? An arch-deacon is the chief deacon: ergo, he is only a deacon. *Whitgift.*

If black scandal or foul-faced reproach
Attend the *sequel* of your imposition,
Your mere enforcement shall acquittance me.

Shakspeare. Richard III.
In these he put two weights,
The *sequel* each of parting and of fight. *Milton.*

Was he not a man of wisdom? Yes, but he was poor: but was he not also successful? True, but still he was poor: grant this, and you cannot keep off that unavoidable *sequel* in the next verse, the poor man's wisdom is despised. *South.*

SEQUENT, *adj.* & *n. s.* } Latin, *sequens*.
SEQUENCE, *n. s.* } Following; suc-
ceeding: a follower: sequence is order of suc-
cession.

How art thou a king,
But by fair *sequence* and succession?

Shakspeare. Richard III.
Let my trial be my own confession:
Immediate sentence then, and *sequent* death,
Is all the grace I beg. *Id. Measure for Measure.*

Here he hath framed a letter to a *sequent* of the stranger queen's, which accidentally miscarried.

Shakspeare.
The cause proceedeth from a precedent *sequence*
and series of the seasons of the year.

Bacon's Natural History.
There he dies, and leaves his race
Growing into a nation; and now grown
Suspected to a *sequent* king, who seeks
To stop their overgrowth. *Milton's Paradise Lost.*

SEQUESTER, *adj.* } Fr. *sequestrer*; low
SEQUESTERABLE, *v. a.* } Lat. *sequestro*. To se-
SEQUESTRATE, *v. n.* } parate from others for
SEQUESTRA'ION, *n. s.* } the sake of privacy;
SEQUESTRA'TOR. } separate generally;
remove; set aside from the owner's use for that

of his creditors : all the derivatives follow one or other of these senses.

A thing as seasonable in grief as in joy, as decent being added unto actions of greatest weight and solemnity, as being used when men most *sequester* themselves from action.

Hooker.

Why are you *sequestered* from all your train ?

Shakspeare.

His addiction was to courses vain ;

I never noted in him any study,

Any retirement, any *sequestration*

From open haunts and popularity. *Id. Henry V.*

Although I had wholly *sequestered* my civil affairs, yet I set down, out of experience in business and conversation in books, what I thought pertinent to this affair.

Bacon.

I am fallen into the hands of publicans and *sequestrators*, and they have taken all from me. *Taylor.*

In shady bower

More sacred and *sequestered*, though but feigned,
Pan or Silvanus never slept.

Milton.

Hartshorn, and divers other bodies belonging to the animal kingdom, abound with a not uneasily *sequestrable* salt.

Boyle.

The metals remain unsevered, the fire only dividing the body into smaller particles, hindering rest and continuity, without any *sequestration* of elementary principles.

Id.

It was his taylor and his cook, his fine fashion, and his French ragouts, which *sequestered* him ; and, in a word, he came by his poverty as sinful as some usually do by their riches.

South.

There must be leisure, retirement, solitude, and a *sequestration* of a man's self from the noise of the world ; for truth scorns to be seen by eyes much fixt upon inferior objects.

Id.

In general contagions more perish for want of necessities than by the malignity of the disease, they being *sequestered* from mankind.

Arbuthnot on Aliments.

Ye sacred Nine ! that all my soul possess,

Whose raptures fire me, and whose visions bless,

Bear me, oh bear me, to *sequestered* scenes

Of bowery mazes, and surrounding greens. *Pope.*

If there be a single spot in the glebe more barren the rector or vicar may be obliged, by the caprice or pique of the bishop, to build upon under pain of *sequestration*.

Swift.

SEQUESTRATION, in common law, is setting aside the thing in controversy, from the possession of both the parties that contend for it. In which sense it is either voluntary, as when done by the consent of the parties ; or necessary, as where it is done by the judge, of his own authority, whether the parties will or not.

SEQUESTRATION, in the civil law, is the act of the ordinary, disposing of the goods and chattels of one deceased, whose estates no man will meddle with. A widow is also said to sequester, when she disclaims having any thing to do with the estate of her deceased husband. Among the Romanists, in questions of marriage, where the wife complains of impotency in the husband, she is to be sequestered into a convent, or into the hands of matrons, till the process be determined.

SEQUESTRATION is also used for the act of gathering the fruits of a benefice void, to the use of the next incumbent. Sometimes a benefice is kept under sequestration for many years, when it is of so small value that no clergyman fit to serve the cure will be at the charge of taking it

by instruction ; in which case the sequestration is committed either to the curate alone, or to the curate and church-wardens jointly. Sometimes the profits of a living in controversy, either by the consent of the parties, or the judge's authority, are sequestered and placed for safety in a third hand till the suit is determined, a minister being appointed by the judge to serve the cure, and allowed a certain salary out of the profits. Sometimes they are sequestered for neglect of duty, for dilapidations, or for satisfying the debts of the incumbent.

SEQUESTRATION, in chancery, is a commission usually directed to seven persons therein named, empowering them to seize the defendant's personal estate, and the profits of his real, and to detain them, subject to the order of the court. It issues on the return of the serjeant at arms, wherein it is certified that the defendant had secreted himself. Sequestrations were first introduced by Sir Nicholas Bacon, lord keeper in the reign of queen Elizabeth ; before which the court found some difficulty in enforcing its process and decrees ; and they do not seem to be in the nature of process to bring in the defendant, but only intended to enforce the performance of the court's decree.

A SEQUESTRATION is also made, in London, upon an action of debt ; the course of proceeding in which case is this :—The action being entered, the officer goes to the defendant's shop or warehouse, when no person is there, and takes a padlock, and hangs it on the door, uttering these words : ' I do sequester this warehouse, and the goods and merchandise therein, of the defendant in this action, to the use of the plaintiff,' &c., after which he sets on his seal, and makes a return of the sequestration in the comptur ; and, four days being passed after the return made, the plaintiff may, at the next court, have judgment to open the shop or warehouse, and to have the goods appraised by two freemen, who are to be sworn at the next court held for that comptur ; and then the serjeant puts his hand to the bill of appraisement, and the court grants judgment thereon ; but yet the defendant may put in bail before satisfaction, and by that means dissolve the sequestration ; and, after satisfaction, may put in bail to disprove the debt, &c.

SEQUIN, a gold coin, struck at Venice, and in several parts of the grand seignior's dominions. In Turkey it is called dahab, or piece of gold, and according to Volney is in value about 6s. 3d. sterling. It varies, however, considerably in its value in different countries. At Venice it is (or was) equal to about 9s. 2d. sterling. The Venetian sequins are in great request in Syria, from the fineness of their standard, and the practice they have of employing them for women's trinkets. The fashion of these trinkets does not require much art ; the piece of gold is simply pierced, to suspend it by a chain, likewise of gold, which flows upon the breast. The more sequins that are attached to this chain, and the greater the number of these chains, the more is a woman thought to be ornamented. This is the favorite luxury, and the emulation of all ranks. Even the female peasants for want of gold wear piastres or smaller pieces : but the women of a

certain rank disdain silver; they will accept of nothing but sequins of Venice, or large Spanish pieces, and crusadoes. Some of them wear 200 or 300, as well lying flat, as strung one on another, and hung near the forehead, at the edge of the head dress. It is a real load; but they do not think they can pay too dearly for the satisfaction of exhibiting this treasure at the public bath, before a crowd of rivals, to awaken whose jealousy constitutes their chief pleasure. The effect of this luxury on commerce is the withdrawing considerable sums from circulation, which remain dead; besides, that when any of these pieces return into common use, having lost their weight by being pierced, it becomes necessary to weigh them. The practice of weighing money is general in Syria, Egypt, and all Turkey. No piece, however effaced, is refused there; the merchant draws out his scales and weighs it, as in the days of Abraham. In considerable payments, an agent of exchange is sent for, who counts paras by thousands, rejects all the false money, and weighs all the sequins, either separately or together.

SEQUINIUS, a native of Alba, who gave one of his daughters in marriage to Curiatius of Alba, and the other to Horatius of Rome. The two sisters were delivered of three sons each on the same day; and these youths, when they grew up, fought the famous battle to decide the superiority of their respective countries, and which ended in favor of Rome. See HORATIUS, and ROME.

SERAGLIO, *n. s.* Italian; perhaps oriental.—Johnson. Heb. שָׂרָא is a mansion. A house of women kept for debauchery.

There is a great deal more solid content to be found in a constant course of well living, than in the voluptuousness of a *seraglio*. Norris.

SERAGLIO is formed from the Persian word *seraw*, or Turkish word *saria*, which signifies a house, and is commonly used to express the house or palace of a prince. In this sense it is frequently used at Constantinople; the houses of foreign ambassadors are called *seraglios*. But it is commonly used by way of eminence for the palace of the grand seignior at Constantinople.

THE SERAGLIO OF THE GRAND SEIGNIOR is in fact his court, where his concubines are lodged, and where the youth are trained up for the chief posts of the empire. It is a triangle about three Italian miles round, wholly within the city of Constantinople, at the end of the promontory *Chrysoceras*, now called the *Seraglio Point*. The buildings run back to the top of the hill, and thence are gardens that reach to the edge of the sea. It is enclosed with a high and strong wall, upon which there are several watch towers: and it has many gates, some of which open towards the sea side, and the rest into the city; but the chief gate is one of the latter, which is constantly guarded by a company of capoochees, or porters; in the night it is well guarded towards the sea. The outward appearance is not elegant; the architecture being irregular, consisting of separate edifices in the form of pavilions and domes. The ladies are a collection of beautiful young women, chiefly sent until of late as pre-

sents from the provinces and the Greek islands, and most of them the children of Christian parents. The brave prince *Heraclius* for some years abolished the infamous tribute of children of both sexes, which Georgia formerly paid every year to the Porte. The number of women in the Harem depends on the taste of the reigning sultan. Sultan *Selim* had 2000, *Achmet* had but 300, and the late sultan had nearly 1600. On their admission they are committed to the care of old ladies, taught sewing, embroidery, music, dancing, &c., and furnished with the richest clothes and ornaments. They all sleep in separate beds, and between every fifth there is a preceptress. Their chief governess is called *Katon Kiaga*. They are said to be obliged to wait on one another by rotation; the last that is entered serves her who preceded her and herself. These ladies are scarcely ever suffered to go abroad, except when the grand seignior removes from one place to another, when a troop of black eunuchs conveys them to the boats, which are enclosed with lattices and linen curtains; and when they go by land they are put into close chariots, and signals are made at certain distances, to give notice that none approach the roads through which they march. Among the emperor's attendants are a number of mutes, who act and converse by signs with great quickness, and some dwarfs, who are exhibited for the sultan's amusement. When he permits the women to walk in the gardens of the *seraglio* all people are ordered to retire, and on every side there is a guard of black eunuchs, with sabres in their hands, while others go their rounds to hinder any person from seeing them. If any one is found in the garden, even through ignorance or inadvertence, he is instantly killed, and his head brought to the feet of the grand seignior, who rewards the guards for their vigilance. Sometimes the grand seignior passes into the gardens to amuse himself when the women are there; and it is then that they make use of their utmost efforts, by dancing, singing, seducing gestures, and amorous blandishments, to attract his affections. It is not permitted that the monarch should take a virgin to his bed, except during the solemn festivals, and on occasion of some extraordinary rejoicings, or the arrival of some good news. Upon such occasions, if the sultan chooses a new companion, he enters into the apartment of the women, who are ranged in files by the governesses, to whom he speaks, and intimates the person he likes best. The others now follow her to the bath, washing, perfuming, and dressing her superbly, and finally conducting her, singing and dancing, to the imperial bed-chamber of the grand seignior. Scarcely has the new elected favorite entered the chamber, introduced by the grand eunuch who is upon guard, than she kneels down, and at the call of the sultan creeps into the foot of the bed: after a certain time, upon a signal given by the sultan, the governess of the girls, with all her suite, enter the apartment, and take her back again, conducting her with the same ceremony to the women's apartments; if by good fortune she becomes pregnant, and is delivered of a boy, she is called *asaki sultanness*, that is to say, *sultanness-mother*;

for the first son she has the honor to be crowned and she has the liberty of forming her court. Eunuchs are also assigned for her guard, and particular service. No other ladies, though delivered of boys, are either crowned or maintained with such costly distinction as the first; however, they have their service apart, and handsome appointments. After the death of the sultan, the mothers of the male children are shut up in the old seraglio, whence they can never come out any more, unless any of their sons ascend the throne. Baron de Tott informs us that the female slave who becomes the mother of a sultan, and lives long enough to see her son mount the throne, is the only woman who at that period alone acquires the distinction of sultana-mother; she is till then in the interior of her prison with her son. The title *bachl-kadun*, or principal woman, is the first dignity of the grand seignior's harem.

SERAGLIO, OR HAREM, OF THE EMPEROR OF MOROCCO.—The account of this seraglio, by M. Lempriere, is still interesting. Being a surgeon, he was admitted into the harem to prescribe for some of the ladies who were indisposed, and was therefore enabled to give a particular account of this female prison. The harem forms a part of the palace. The apartments, which are all on the ground floor, are square, very lofty, and four of them enclose a spacious square court, into which they open by means of large folding doors. In the centre of these courts, which are floored with blue and white chequered tiling, is a fountain, supplied by pipes from a large reservoir on the outside of the palace, which serves for the frequent ablutions recommended by the Mahometan religion. The whole of the harem consists of about twelve of these courts, communicating with each other by narrow passages, which afford a free access from one part of it to another, and of which all the women are allowed to avail themselves. The apartments are ornamented on the outside with beautiful carved wood. In the inside most of the rooms are hung with rich damask of various colors; the floors are covered with beautiful carpets, and there are mattresses disposed at different distances, for the purposes of sitting and sleeping. The apartments are also furnished at each extremity with an elegant European mahogany bedstead, hung with damask, having on it several mattresses placed one over the other, which are covered with various colored silks; but these beds are merely for ornament. In all the apartments the ceiling is wood, carved and painted. The principal ornaments were large and valuable looking glasses, hung on different parts of the walls; clocks and watches of different sizes, in glass cases, were disposed in the same manner. The sultana Lalla Batoom and another favorite were indulged with a whole square to themselves; but the concubines were only each allowed a single room. Each female had a separate daily allowance from the emperor, proportioned to the estimation in which they were held by him. The late emperor's allowance was very trifling: Lalla Douyaw, the favorite sultana, had very little more than half-a-crown English a day, and the others less. He indeed made them occasional presents of money, dress,

and trinkets; but this could never be sufficient to support the expenses they must incur. Their greatest dependence therefore was on the presents they received from those Europeans and Moors who visited the court, and who employed their influence in obtaining some particular favor from the emperor. This was the most successful mode that could be adopted. When M. Lempriere was at Morocco, a Jew, desirous of obtaining a very advantageous favor from the emperor, for which he had been a long time unsuccessfully soliciting, sent to all the principal ladies of the harem presents of pearls to a very large amount: the consequence was that they all went in a body to the emperor, and immediately obtained the wished for concession. The ladies separately furnish their own rooms, hire their own domestics, and, in fact, do what they please in the harem, but are not permitted to go out without an express order from the emperor, who very seldom grants them that favor, except when they are to be removed from one palace to another. In that case a party of soldiers is despatched a little distance before them to disperse the male passengers, and prevent their being seen. This previous step being taken, a piece of linen cloth is tied round the lower part of the face, and afterwards these miserable females cover themselves entirely with their haicks, and either mount mules, which they ride like men, or, what is more usual, are put into a square carriage or litter, constructed for this purpose, which by its lattice-work allows them to see without being seen. In this manner they set off, under a guard of black eunuchs. This journey, and sometimes a walk within the bounds of the palace, is the only exercise they are permitted to take. The late emperor's harem consisted of between sixty and 100 females, besides their numerous domestics and slaves. Many of the concubines were Moorish women: several were European slaves, who had either been made captives, or purchased by the emperor; and some were negroes. In this group the Europeans, or their descendants, had by far the greatest claim to the character of handsome. There was one, in particular, who was a native of Spain, and taken into the harem at about the same age as Lalla Douyaw, who was indeed a perfect beauty; and many others were almost equally handsome. The eunuchs, who have the entire charge of the women, and who in fact live always among them, are the children of negro slaves. They are generally either very short and fat, or else tall, deformed, and lame. Their voices have that particular tone which is observable in youths who are just arriving at manhood; and their persons altogether afford a disgusting image of weakness and effeminacy.

M. Lempriere gives a very curious account of the manners of these immured females:—'Attended by a eunuch,' says he, 'after passing the gate of the harem, which is always locked, and under the care of a guard of eunuchs, we entered a narrow and dark passage, which soon brought us to the court, into which the women's chambers open. We here saw numbers of both black and white women and children; some concubines, some slaves. Upon their observing the unusual figure of a European, the whole

multitude in a body surrounded me, and expressed the utmost astonishment at my dress and appearance. Some stood motionless with their hands lifted up, their eyes fixed, and their mouths open, in wonder and surprise. Some burst into fits of laughter; while others with uncommon attention eyed me from head to foot. The parts of my dress which seemed most to attract their notice were my buckles, buttons, and stockings; for neither men nor women in this country wear any thing of the kind. With respect to the club of my hair, they seemed utterly at a loss in what view to consider it; but the powder they conceived to be employed for destroying vermin. Most of the children, when they saw me, ran away in consternation; and I appeared as singular an animal, and I dare say had the honor of exciting as much curiosity and attention, as a lion or a man-tiger just imported from abroad, and introduced into a country town in England on a market-day. Every time I visited the harem I was surrounded and laughed at by this curious mob, who, on my entering the gate, followed me close to the very chamber to which I was proceeding, and on my return universally escorted me out. The greater part of the women were uncommonly fat and unskillful; had black and full eyes, round faces, with small noses. They were of different complexions; some very fair, some sallow, and others again perfect negroes. One of my new patients being ready to receive me, I was desired to walk within her room; where to my great surprise I saw nothing but a curtain drawn quite across the apartment, similar to that of the theatre which separates the stage from the audience. A female domestic brought a very low stool, placed it near the curtain, and told me I was to sit down there, and feel her mistress's pulse. The lady, who had by this time summoned up courage to speak, introduced her hand from the bottom of the curtain, and desired me to inform her of all her complaints, which she conceived I might perfectly do by merely feeling the pulse. It was in vain to ask her where her pain was seated; the only answer I could procure was a request to feel the pulse of the other hand. I was under the necessity of informing her in positive terms that to understand the disease it was absolutely necessary to see the tongue as well as to feel the pulse; and that without it I could do nothing for her. My eloquence, or that of my Jewish interpreter, was, however, long exerted in vain; and she would have dismissed me without any further enquiry, had not her invention supplied her with a happy expedient. She contrived to cut a hole through the curtain through which she extruded her tongue, and thus complied with my injunction, but most effectually disappointed my curiosity. I was afterwards ordered to look at another of the prince's wives, who was affected with a scrophulous swelling in her neck. This lady was, in the same manner as the other, at first excluded from my sight; but, as she was obliged to show me her complaint, I had an opportunity of seeing her face, and observed it to be very hands. It is curious to observe the childish notions of persons who have been totally secluded from the world. All the ladies of the harem expected that

our author should have instantly discovered their complaints upon feeling the pulse, and that he could cure every disease instantaneously. He found them proud and vain of their persons, and extremely ignorant. 'Among many ridiculous questions, they asked my interpreter,' says M. Lempriere, 'if I could read and write; upon being answered in the affirmative, they expressed the utmost surprise and admiration at the abilities of the Christians. There was not one among them who could do either; these rudiments of learning are indeed only the lot of a few of their men, who on that account are named Talbs, or explainers of the Mahometan law.' Their needlework is performed by Jewesses; their food is dressed, and their chambers taken care of, by slaves and domestics. They have no amusement but a rude and barbarous kind of melancholy music, without melody, variety, or taste; and conversation with one another, which must indeed be very confined, uniform, and inanimate, as they never see a new object. Excluded from the enjoyment of fresh air and exercise, so necessary for the support of health and life; deprived of all society but that of their fellow sufferers, a society to which most of them would prefer solitude itself; they are only to be considered as the most abject of slaves—slaves to the vices and caprice of a licentious tyrant, who exacts even from his wives themselves a degree of submission and respect which borders upon idolatry, and which God never meant should be paid to a mortal.

SERAI, a building on the high-road or in large cities in India, erected for the accommodation of travellers.

SERAMPEI, a district in the interior of Sumatra, bounded on the north and north-west by Korinchi, on the east, south-east, and south, by Pakalang, Jambee, and Sungei-tenang; and on the west and south-west by the greater Ayer Dikit River, and chain of high mountains bordering on the Sungei-ipu country. It comprehends fifteen fortified independent villages, besides several talangs, or small open ones. Their entrenchments consist of large trees laid horizontally between stakes driven into the ground, about seven feet high, and six feet thick, with loop-holes for firing through. The inhabitants further defend themselves by planting ranjans which are small sharp-pointed rods, in the paths and carefully concealed, which wound the feet in a distressing manner. They decapitate the bodies of their enemies, stick the heads on poles, and address abusive language to them. Those taken alive are made slaves. In general the inhabitants seem to be quiet and inoffensive. The women are ugly, and their manners uncouth. These people are very strong, being capable of carrying heavy loads during journeys of twenty or thirty days. They acknowledge themselves the subjects of the sultan of Jambee. The country produces cocoa-nuts and cassia. Of the animal productions the rhinoceros is the most considerable; unless we except an annoying insect which drops in myriads from the trees, and being very long and slender, penetrates the clothes, when travellers sometimes strip, and go into the water in order to wash them off. Part of Serampey is hilly; it is intersected by several

rivers, and contains hot springs, near which columns of smoke are seen to issue from the earth. The inhabitants are Mahometans.

SERAMPORE, so called after Siri Ram, one of the Hindoo deities, a town of Bengal, belonging to the Danes, and pleasantly situated on the western bank of the Bhagarutty or Hoogly River, twelve miles north of Calcutta. The territory attached extends about a mile along the river, by half a mile in breadth. The houses are of brick, plastered with mortar, and have flat roofs, with balconies and Venetian windows, but few of them are more than two stories high. There is a handsome church, and a battery of twelve pieces of cannon near the flag-staff. It carries on a trifling trade with Europe, China, &c., but is principally distinguished as the residence of the Baptist missionaries, and of the British subjects who take refuge here from their creditors. About the year 1676 the Danes obtained this site for their factory, from the nabob Shaista Khan, who gave great countenance to European and other merchants. During the short war with the Danes it was taken possession of by a British force, but soon after restored. Long. 88° 26' E., lat. 22° 45' N.—There are several other places of this name in Hindostan.

SERANGANI, a cluster of islands in the eastern seas, about five leagues from the southern extremity of Magindanao, and between 5° and 6° of N. lat. The largest, named Hummock, is about thirty miles, and the next in size about twenty-five miles in circumference. There is also another of inferior dimensions. This island, which is the most westerly, is very high, making a sugar loaf. Its north coast is bold: it is well cultivated, and is called Belk. It produces most of the tropical fruits, together with rice, sugar-canes, pine-apples, mangoes, sour oranges, limes, jacks, plantains, cocoa-nuts, sago, sweet potatoes, tobacco, Indian corn, and honey. The eastern has not near so good an appearance, neither are there any cocoa-nut trees to be seen on it. These islands abound in refreshments, with which they abundantly supply ships. The articles most in request among them are white or printed cottons, such as loose gowns or jackets, colored handkerchiefs, clasp knives, razors, and bar iron: metal buttons are also in demand, and a coat is soon stripped. The inhabitants speak the same language, and are of the same description, as those on the sea coast of Magindanao, being complete Malays. They have canoes, and larger boats, armed with small brass cannon; and, like the other natives of the eastern isles, are addicted to piracy. Their prows are covered with an awning of split bamboos. The Dutch East India Company claimed a sovereignty here, but do not appear to have exercised any of its functions, or to have founded any colonies.

SERAPEUM, Lat., in archæology, a temple of Serapis, the Egyptian deity. The most famous of these edifices was that at Alexandria. Rufinus, who witnessed it while standing, has left us the following description:—‘This vast mass of building is square, and forms an immense platform, supported on arches, and upon which stands the temple itself. The vaults of the plat-

form are separated into a great number of different apartments, which afford lodging to the priests and attendants; and around are refectories, council chambers, &c. The temple itself is adorned with columns, and has walls of marble.’ Ptolemy, the son of Lagus, had built this serapeum on a spot by which, for a long time before, had stood a chapel consecrated to Serapis and Isis. Both this and the new temple, however, were destroyed by order of the Christian emperor Theodosius. The statue of Serapis, according to Macrobius, was of a human form, with a basket or bushel on his head, signifying plenty. His right hand leaned on the head of a serpent, whose body was wound round a figure with three heads—of a dog, a lion, and a wolf. In his left hand he held a measure of a cubit length, as it were, to take the height of the waters of the Nile. This celebrated statue was destroyed with the temple; its limbs first carried in triumph through the city, and then thrown by the Christians into a fierce fire kindled for that purpose in the amphitheatre. The figure of Serapis is found on many ancient medals.

SERAPHI, *n. s.* } Heb. שֵׂרָפִים, literally, a
SERAPHIC, *adj.* } burning one. One of the
supposed orders of angels: seraphim is the proper plural: seraphic is relating to or like seraphim.

Then flew one of the *seraphims* unto me, having a live coal in his hand. *Isaiah vi. 6.*

To thee cherubim and *seraphim* continually do cry.
Common Prayer.

Love is curious of little things, desiring to be of angelical purity, of perfect innocence, and *seraphical* fervor. *Taylor.*

Of *seraphim* another row. *Milton.*

Seraphick arms and trophies. *Id.*

He is infinitely more remote, in the real excellency of his nature, from the highest and perfectest of all created beings, than the purest *seraph* is from the most contemptible part of matter, and consequently must infinitely exceed what our narrow understandings can conceive of him. *Locke.*

As full, as perfect, in vile man that mourns,
As the rapt *seraph* that adores and burns. *Pope.*

’Tis to the world a secret yet,
Whether the nymph, to please her swain,
Talks in a high romantic strain;
Or whether he at last descends
To like with less *seraphick* ends. *Swift.*

SERAPH, or **SERAPHIM**, has been considered, but upon what grounds we know not, as a spirit of the highest rank in the hierarchy of angels; who are thus called from their being supposed to be most inflamed with divine love, by their nearer and more immediate attendance at the throne of God, and to communicate their fervor to the remoter and inferior orders. See **ANGEL**.

SERAPIAS, in botany, a genus of the dianthia order, and gynandria class of plants; natural order seventh, orchideæ; the nectarium is egg-shaped and gibbous, with an egg-shaped lip. The species, according to Linnæus, are eleven; viz. 1. *S. Capensis*; 2. *cordigera*; 3. *erecta*; 4. *falcata*; 5. *grandiflora*, or *ensifolia*; 6. *lanceifolia*; 7. *latifolia*; 8. *lingua*; 9. *longifolia*; 10. *palustris*; 11. *rubra*. Of these the following are the most remarkable:—1. *S. grandiflora*, or white-flowered helleborine, grows in woods,

and flowers in June. Its characteristics are, fibrous bulbs, sword-shaped leaves, erect flowers; and the lip of the nectarium is obtuse and shorter than the petals. The flowers are large and erect, and consisting of six or eight in a thin spike; the petals are all white, and connive together; the lip of the nectarium is inclosed within the petals, is white and streaked with three yellow prominent lines. It is a native of Britain. 2. *S. latifolia*, the broad-leaved helleborine, is distinguished by fibrous bulbs, by ovate stem-clasping leaves, and pendulous flowers. The stalk is erect, about a cubit high, and furnished with six or eight nervous oval leaves; the spike is about six inches long; the three upper petals are of a green color, and of an oval acute form; the lateral ones are a little shorter, and of a white color, with a little tinge of green. It is a native of Britain. 3. *S. longifolia*, the long leaved helleborine, is also a native of Britain. It has long leaves. 4. *S. palustris*, the marsh helleborine, grows in rough boggy pastures and marshes, and flowers in July. It is distinguished by fibrous bulbs, sword-shaped sessile leaves, pendulous flowers; and the lip of the nectarium is obtuse, somewhat serrated, and longer than the petals. The flowers grow to the number of fifteen or twenty in a loose spike. The three exterior petals are green mixed with red; the lateral ones are white with a red blush; and the nectarium is marked with red lines and yellow tuberculous spots.

SERAPIO, a Greek poet, who flourished in the reign of Trajan. He was intimate with Plutarch.

SERAPION, a physician of Alexandria. He and Philinus of the isle of Cos were both scholars of Herophilus, and founders of the empiric sect; about A. A. C. 287.

SERAPION (John), an Arabian physician, who flourished about A. D. 890. He is by some confounded with the Alexandrian, though he lived 600 years later. His works were printed at Venice, in folio, in 1497, and 1550.

SERAPIS, in mythology, an Egyptian deity, who was worshipped under various names and attributes, as the tutelary god of Egypt in general, and as the patron of several of their principal cities. Herodotus, who describes all the other Egyptian deities, makes no mention of Serapis. Tacitus informs us that he was worshipped as a kind of universal deity that represented Æsculapius, Osiris, Jupiter, and Plato; and he was sometimes taken for Jupiter Ammon, the Sun, and Neptune; and the honors that were rendered to him at Alexandria were more solemn and extraordinary than those of any other place. Plutarch, Clemens of Alexandria, and Tacitus inform us, that while the first Ptolemy was employed in fortifying Alexandria with walls, adorning it with temples and stately buildings, there appeared to him in his sleep a young man of extraordinary beauty, of a stature more than human, admonishing him to dispatch into Pontus some of his most trusty friends to bring thence his statue: he assured him that the city and kingdom which possessed it should prove happy, glorious, and powerful. The young man, having thus spoke, disappeared, mounting up into heaven in a blaze

of fire. Ptolemy discovered his vision to the priests; but, finding them ignorant of Pontus, he had recourse to an Athenian, who informed him that near Sinope, a city of Pontus, there was a temple much resorted to by the natives, which was consecrated to Pluto, where he had a statue, near which stood that of a woman. Ptolemy neglecting the injunctions of the apparition, it again appeared to him in a menacing attitude; and the king immediately dispatched ambassadors to the Serapian monarch, loaded with presents. The king of Sinope consented; but his subjects opposed the removal of the statue. The god, however, of his own accord, as we are informed, conveyed himself to the ambassador's ship, and in three days landed in Alexandria. The statue of Serapis was erected in one of the suburbs of the city, where a magnificent temple was afterwards reared. This statue, according to Macrobius, was of a human form, with a basket or bushel on his head, signifying plenty; his right hand leaned on the head of a serpent, whose body was wound round a figure with three heads, of a dog, a lion, and a wolf; in his left hand he held a measure of a cubit length, as it were to take the height of the waters of the Nile. The figure of Serapis is found on many ancient medals. The famous temple of Serapis at Alexandria was destroyed by order of Theodosius; and the celebrated statue of this deity was broken in pieces, and its limbs carried first in triumph by the Christians through the city, and then thrown into a fierce fire, kindled for that purpose in the amphitheatre. As the Egyptians ascribed the overflowing of the Nile, to which was owing the fertility of their country, to the benign influence of their god Serapis, they concluded that now he was destroyed the river would no longer overflow, and that a general famine would ensue; but when they observed, on the contrary, that the Nile swelled to a greater height than had been known in the memory of man, and thereby produced an immense plenty of all kinds of provisions, many of the Pagans, renouncing the worship of idols, adored the god of the Christians.

SERE, *adj.* Sax. *seapian*, to dry. Dry; withered; no longer green. See SEAR.

The muses, that were wont green bays to wear,
Now bringen bitter elder-branches *sere*. Spenser.

He is deformed, crooked, old, and *sere*,
Ill-faced, worse bodied, shapeless every where;
Vicious, ungentle. *Shakspeare. Comedy of Errors.*

Ere this diurnal star
Leave cold the night, how we his gathered beams
Reflected may with matter *sere* foment. Milton.

They *sere* wood from the rotten hedges took,
And seeds of latent fire from flints provoke. Dryden.

On a *sere* branch,
Low bending to the bank, I sat me down,
Musing and still. *Rowe's Royal Convert.*

SERE, *n. s.* Of this word I know not the etymology. Can it come, like sheers, from Sax. *seapian*, to cut!—Johnson. Ital. *serri*; Fr. *serre*; of Lat. *sero*.—Thomson. Claw; talon

Two eagles,
That mounted on the winds, together still
Their strokes extended; but arriving now
Amidst the council, over every brow

Shook their thick wings, and threatening death's cold fears,

Their necks and cheeks tore with their eager *seres*,

Chapman.

SERF, in hawking, is used for the yellow part of a hawk between the beak and the eyes (see FALCONRY); but this cannot be Chapman's meaning.

SEREGIPPE, or SERGIPPE, a province of Brasil, bounded north by Pernambuco, south by the province of Todos Santos, east by the sea, and west by interior deserts. It is very fertile and well cultivated, abounding in cattle, grain, tobacco, and sugar, in all of which it carries on a flourishing trade. Its ports do not admit large vessels. Population 20,000.

SEREGIPPE, the capital of the above province, is situated on the shore of the river Vazabaris, five miles from the coast. It has a very handsome parish church, but is not a large or very flourishing place.

SERENADE, *n. s.* Fr. *serenade*; Ital. *serenata*, whence in Milton *serenate*, from Lat. *serenus*, the lovers commonly attending their mistresses in fair nights. Music or songs with which ladies are entertained by their lovers in the night.

Mixt dance, or wanton mask, or midnight ball, Or *serenate*, which the starved lover sings To his proud fair; best quitted with disdain.

Milton.

Foolish swallow, what dost thou

So often at my window do,

With thy tuneless *serenade*?

Cowley.

Shall I the neighbours' nightly rest invade,

At her deaf doors, with some vile *serenade*?

Dryden.

He continued to *serenade* her every morning, till the queen was charmed with his harmony.

Spectator.

Will fancies he never should have been the man he is, had not he broke windows, and disturbed honest people with his midnight *serenade*, when he was a young fellow.

Addison.

A SERENADE is a kind of concert given in the night by a lover to his mistress, under her window. These sometimes consist only of instrumental music, but at other times voices are added; the music and songs composed for these occasions are also called serenades.

SERENE, *n. s. & v. a.* Fr. *sercin*; Latin

SERENELY, *adv.* } *serenus.* Calm;

SERENITUDE, *n. s.* } placid; quiet: the

SERENITY. } adverb and noun

substantive corresponding.

Wherever death doth please to appear, Seas, *serenes*, swords, shots, sickness, all are there.

Ben Jonson.

From the equal distribution of the phlegmatick humour will flow quietude and *serenitude* in the affections.

Wotton.

Spirits live inspired

In regions mild of calm and *serene* air.

Milton.

There wanted yet a creature might erect

His stature, and upright with front *serene*

Govern the rest.

Id.

These eyes that roll in vain,

So thick a drop *serene* hath quenched their orbs.

Id.

A general peace and *serenity* newly succeeded a general trouble and cloud throughout all his kingdoms.

Temple.

Whatever practical rule is generally broken, cannot be supposed innate; it being impossible that men would, without shame or fear, confidently and *serenely* break a rule which they could not but evidently know that God had set up.

Locke.

I cannot see how any men should ever transgress those moral rules, with confidence and *serenity*, were they innate, and stamped upon their minds.

Id.

Take care

The muddy beverage to *serene*, and drive

Precipant the baser rosy lees.

Philips.

Exciting them, by a due remembrance of all that is past, unto future circumspection, and a *serene* expectation of the future life.

Grew's Cosmologia.

The nymph did like the scene appear,

Serenely pleasant, calmly fair:

Soft fell her words as flew the air.

Prior.

In the constitution of a perpetual equinox, the best part of the globe would be desolate; and, as to that little that would be inhabited, there is no reason to expect that it would constantly enjoy that admired calm and *serenity*.

Bentley.

The moon, *serene* in glory, mounts the sky.

Pope.

The setting sun now shone *serenely* bright.

Id.

Pure *serenity* apace

Induces thought and contemplation still.

Thomson.

A black cloud hangs hovering over their minds; which, when it falls in showers through their eyes, is dispersed, and all within is *serene* again.

Mason.

Can hopes of Heaven, bright prospects of an hour

That come to waft us out of Sorrow's power,

Obscure or quench a faculty that finds

Is happiest soil in the *serenest* minds?

Religion curbs indeed its wanton play,

And brings the trifler under rigorous sway.

Couper.

SERENE is also a title of honor given to several princes, and to the principal magistrates of republics. The king of Britain, and the children of the king of Spain, are called most *serene*; as were also the late republic and doge of Venice: and, when the pope or the sacred college write to emperors or kings, they give them no other titles.

SERENUS SAMMONICUS, a celebrated physician, who flourished in the reigns of Severus and Caracalla, about A. D. 200. He wrote several treatises on history and the works of nature; but there is only one poem extant, On the Remedies of Diseases. The best edition is that of Amsterdam, in 8vo., 1706. He was murdered, at a festival, by the order of Caracalla. He had a library that contained 62,000 volumes, which Quintus Serenus Sammonicus, his son, gave to Gordian the Younger, to whom he was preceptor.

SERERES, a tribe of the Joloffs, in Western Africa, inhabiting the country in the vicinity of Cape Verd. They are dispersed into small republics, which unite into one body against a common enemy, and go naked. They appear to have few or no ideas of religion; but seem an inoffensive industrious people, and hospitable to strangers.

SERES, or SIRUS, a large inland town of modern Macedon, situated in an elevated plain, at some distance to the east of the ancient Strymon, now the Carasou or Pondus. It has a number of handsome mosques, baths, and other public edifices. Its manufacture of towels and strong

linen cloth is the most noted in the Levant: those of cotton stuffs are also very extensive. The surrounding district is fertile in cotton, tobacco, and different kinds of corn and fruit. It is to this fertility, and the health of the situation, that the town owes its increase. It is the residence of a Greek archbishop. Population 30,000. Forty-five miles north-east of Salonica.

SERGE, *n. s.* Fr. *serge*; Span. *xerga*, which Covarruvias derives from Arab. *xirica*, Skinner from Germ. *serge*, a mat. A kind of woollen cloth.

The same wool one man felts into a hat another weaves into cloth, another into kersey or *serge*, and another into arras. *Hale.*

Ye weavers, all your shuttles throw,
And bid broad-cloths and *serges* grow. *Gay.*

SERGE is a woollen quilted stuff, manufactured commonly on a loom with four treddles, after the manner of rateens, and other stuffs that have a wale. The goodness of serges is known by the quilting, as that of cloth by the spinning. Of serges there are various kinds, denominated either from the different qualities thereof or from the places where they are wrought. The most considerable is the London serge, highly valued abroad, particularly in France, where a manufacture is carried on with considerable success, under the title of *serge façon de Londres*. The method of making the London serge is as follows:—For wool, the longest is chosen for the warp, and the shortest for the woof. Before either kind is used it is first scoured, by putting it in a copper of liquor, somewhat more than lukewarm, composed of three parts of fair water and one of urine. After having staid long enough therein for the liquor to dissolve, and had the grease taken off, &c., it is stirred briskly about with a wooden peel; taken out of the liquor, drained, and washed in a running water, dried in the shade, beaten with sticks on a wooden rack to drive out the coarser dust and filth, and then picked clean with the hands. Thus far prepared, it is greased with oil of olives, and the longest part, destined for the warp, is combed with large combs, heated in a little furnace for the purpose. To clear off the oil again, the wool is put in a liquor composed of hot water with soap melted therein: whence being taken out, wrung, and dried, it is spun on a wheel. The shorter wool, intended for the woof, is only carded on the knee with small cards, and then spun on the wheel, without being scoured of its oil. It must be remarked that the thread for the warp is always to be spun much finer, and better twisted than that of the woof. The wool, both for the warp and the woof, being spun, and the thread divided into skains, that of the woof is put on spools (unless it has been spun upon them) fit for the cavity or eye of the shuttle; and that for the warp is wound on a kind of wooden bobbins, to fit it for warping. When warped, it is stiffened with a kind of size, whereof that made of the shreds of parchment is held the best; and when dry is put on the loom. When mounted on the loom, the workman raising and lowering the threads (which are passed through a reed), by means of four treddles placed underneath the loom, which he makes to act trans-

versely, equally, and alternately, one after another, with his feet, in proportion as the threads are raised and lowered, throws the shuttle across from one side to the other; and each time that the shuttle is thrown, and the thread of the woof is crossed between those of the warp, strikes it with the frame to which the reed is fastened, through those teeth the threads of the warp pass; and this stroke he repeats twice or thrice, or even more, till he judges the crossing of the serge sufficiently close: thus he proceeds till the warp is all filled with woof. The serge now taken off the loom is carried to the fuller, who scours it in the trough of his mill with a kind of fat earth, called fuller's earth, first purged of all stones and filth. After three or four hours' scouring, the fullers' earth is washed out in fair water, brought by little and little into the trough, out of which it is taken when all the earth is cleared: then, with a kind of iron pincers, or plyers, they pull off all the knots, ends, straws, &c., sticking out on the surface on either side, and then return it into the fulling trough, where it is worked with water somewhat more than lukewarm, with soap dissolved therein, for nearly two hours; it is then washed out till the water becomes quite clear, and there be no signs of soap left; then it is taken out of the trough, the knots, &c., again pulled off, and then put on the tenter to dry, taking care as fast as it dries to stretch it out both in length and breadth till it be brought to its just dimensions. When well dried, it is taken off the tenter, and dyed, shorn, and pressed.

SERGEANT, *n. s.* } Fr. *sergent*; Ital. *ser-*
SERGEANTRY, } *gente*; from Lat. *ser-*
SERGEANTSHIP. } *viens*. An officer whose business it is to execute the commands of others; his office: for the legal use see below.

When it was day, the magistrates sent the sergeants, saying, Let these men go. *Acts xvi. 35.*

Had I but time, as this fell sergeant, Death,
Is strict in his arrest, oh! I could tell.

Shakspeare. Hamlet.

This is the sergeant,
Who like a good and hardy soldier fought.

Id. Macbeth.

None should be made sergeants but such as probably might be held fit to be judges afterwards.

Bacon.

Grand *sergeantry* is that where one holdeth lands of the king by service, which he ought to do in his own person unto him: as to bear the king's banner or his spear, or to lead his host, or to be his marshal, or to blow a horn, when he seeth his enemies invade the land; or to find a man at arms to fight within the four seas, or else to do it himself; or to bear the king's sword before him at his coronation; or on that day to be his sewer, carver, butler, or chamberlain. Petit *sergeantry* is where a man holdeth land of the king, to yield him yearly some small thing towards his wars; as a sword, dagger, bow, knife, spear, pair of gloves of mail, a pair of spurs, or such like.

Covel.

SERGEANT, in war, is an uncommissioned officer in a company of foot or troop of dragoons, armed with a halberd, and appointed to see discipline observed, to teach the soldiers the exercise of their arms, to order, straighten, and form their ranks, files, &c. He receives the orders

from the adjutant, which he communicates to his officers. Each company generally has two serjeants.

SERGEANT AT ARMS, or MACE, an officer appointed to attend the person of the king; to arrest traitors, and such persons of quality as offend; and to attend the lord high steward when sitting in judgment on a traitor. Of these, by stat. 13 Rich. II. c. 6, there are not to be above thirty in the realm. There are ordinarily nine at court called the king's serjeants at arms, to distinguish them from others, who are created with great ceremony; the person kneeling before the king, his majesty lays the mace on his right shoulder, and says, Rise up serjeant at arms, and esquire for ever. They have besides a patent for the office, which they hold for life. They have their attendance in the presence-chamber, where the band of gentlemen pensioners wait; and, receiving the king at the door, they carry the maces before him to the chapel door, whilst the band of pensioners stand foremost, and make a lane for the king, as they also do when the king goes to the house of lords. There are four other serjeants at arms created in the same manner; one who attends the lord chancellor; a second the lord treasurer; a third the speaker of the house of commons; and a fourth the lord mayor of London on solemn occasions. They have a considerable share of the fees of honor, and travelling charges allowed them when in waiting, viz. five shillings per day when the court is within ten miles of London, and ten shillings when twenty miles from London. The places are in the lord chamberlain's gift. There are also serjeants of the mace of an inferior kind, who attend the mayor or other head officer of a corporation.

SERGEANT AT LAW, or OF THE COIF, is the highest degree taken at the common law, as that of doctor is of the civil law; and, as these are supposed to be the most learned and experienced in the practice of the courts, there is one court appointed for them to plead in by themselves, which is the common pleas, where the common law of England is most strictly observed: but they are not restricted from pleading in any other court, where the judges, who cannot have that honor till they have taken the degree of serjeant at law, call them brothers.

SERGEANT, COMMON, an officer in the city of London, who attends the lord mayor and court of aldermen on court days, and is in council with them on all occasions, within and without the precincts or liberties of the city. He is to take care of orphans' estates, either by taking account of them, or to sign their indentures, before their passing the lord mayor and court of aldermen: and he was likewise to let and manage the orphans' estate according to his judgment, to their best advantage. See **RECORDER**.

SERGEANT MAJOR, a non-commissioned officer subordinate to the adjutant.

SERGEANTY, *serjentia*, signifies, in law, a service that cannot be due by a tenant to any lord but the king. Though all tenures are turned into socage, by 12 Car. II. c. 24, yet the honorary services of grand serjeanty still remain, being therein excepted. See **KNIGHT-SERVICE**.

This word is the same with serjeantry; but it would puzzle an antiquarian to tell how or why such trifling variations of spelling have been introduced.

SERGESTES, a sailor in Æneas's fleet, from whom the Roman family of the Sergii claimed their descent. Virg. Æn. v. 121.

SERGII, the surname of a patrician family of ancient Rome, which produced several great men and one great villain. See **CATILINE**, and **SERGIVS**.

SERGINES, a town of France, in the department of the Yonne: nine miles north of Sens, and thirteen and a half south of Provins.

SERGIPO DEL REY. See **SEREGIPPE**.

SERGIUS CATILINA. See **CATILINA**.

SERGIVS I., pope of Rome, was born at Palermo, and elected pope in 687. He died in 701, with a good reputation, after a reign of thirteen years and eight months.

SERGIVS II. was a native of Rome; succeeded Gregory IV. in 844; and died in 847.

SERGIVS III. was elected pope by the Romans in 898; but, the party of John IX. prevailing, he was driven from his seat, and did not recover it till A. D. 905. He disgraced his dignity by his vices, and died in 911.

SERGIVS IV. succeeded John XVIII. in 1009. He was humble and liberal minded. He died in 1112.

SERIES, *n. s.* Fr. *serie*; Lat. *series*. Sequence; order.

Draw out that antecedent, by reflecting briefly upon the text, as it lies in the *series* of the epistle.

Ward of Infidelity.

The chasms of the correspondence I cannot supply, having destroyed too many letters to preserve any *series*. Pope.

This is the *series* of perpetual woe,
Which thou, alas! and thine, are born to know.

Id.

SERIES, in general, denotes a continual succession of things in the same order, and having the same relation or connexion with each other; in this sense we say, a series of emperors, kings, bishops, &c. In natural history, a series is used for an order or subdivision of some class of natural bodies; comprehending all such as are distinguished from the other bodies of that class, by certain characters which they possess in common, and which the rest of the bodies of that class have not.

SERIES, in music. See **MUSIC**.

SERIES, in arithmetic and algebra, a rank or number of terms in succession, increasing or diminishing in some certain ratio or proportion. There are several kinds of series; as arithmetical, geometrical, infinite, &c. The two first of these are, however, more generally known or distinguished by the names of arithmetical and geometrical progression. These series have already been explained and illustrated in the article **ALGEBRA**, particularly the two first: it therefore only remains, in this place, to add a little to what has already been done to the last of these; viz. **INFINITE SERIES**.

SERIES, HARMONIC, a series of terms formed in harmonical proportion. It has been observed in the article **PROPORTION**, that if three numbers

be in harmonical proportion the first is to the third as the difference between the first and second is to the difference between the second and third. Let a , b , and x be three terms in harmonical proportion; then $a : x :: a - b : b - x$.

$$\text{whence } a x - b x = a b - a x,$$

$$\text{and } 2 a x - b x = a b$$

$$\text{then } x = \frac{a b}{2 a - b}. \text{ Hence the}$$

first three terms of this is $a, b, \frac{a b}{2 a - b}$.

Again: let x be the fourth term; to find which, in terms of a and b , we have

$$b : x :: b - \frac{a b}{2 a - b} : 2 a - b - \frac{a b}{2 a - b} - x$$

$$\text{Then } b x - \frac{2 a b}{2 a - b} x = \frac{2 a b^2}{3 a b - 2 b^2} - \frac{a b^2}{a b^2}$$

$$x = \frac{2 a - b}{2 a - b} \cdot \frac{2 a - b}{3 a - 1 b^2} = \frac{a b}{3 a - 1 b^2}$$

therefore the first four terms are $a, b, \frac{a b}{2 a - b},$

$$\frac{a b}{a - 2 b}. \text{ Whence the law of the series is ob-}$$

vious, and it may be continued as follows: $a, b,$

$$\frac{a b}{2 a - b}, \frac{a b}{3 a - 2 b}, \frac{a b}{4 a - 3 b}, \frac{a b}{5 a - 4 b}, \&c.,$$

and the ninth term is $\frac{a b}{n - 1. a - n - 2. b}$. If, in

a series in harmonical proportion, a and b be two affirmative quantities, and such that $a < b$; then this series, which is positive at first, will become negative as soon as $n - 2. b$ exceeds $n - 1. a$. But, if $a > b$, the series will converge; and, although produced to infinity, will not become negative. Let a and b be equal to 2 and 1 respectively; then this series becomes $\frac{2}{3}, \frac{2}{5}, \frac{2}{7}, \&c.$; and, since if each term of an harmonical series be divided by the same quantity, the series will still be harmonical, therefore $\frac{1}{3}, \frac{1}{5}, \frac{1}{7}, \&c.$, is an harmonical series: whence the denominators of this series form a series of numbers in arithmetical progression; and conversely, the reciprocals of an arithmetical progression are in harmonical proportion.

SERIES, INFINITE, is formed by dividing the numerator of a fraction by its denominator, being a compound quantity; or by extracting the root of a surd. An infinite series is either converging or diverging. A converging series is that in which the magnitude of the several terms gradually diminish; and a diverging series is that in which the successive terms increase in magnitude. The law of an infinite series is the order in which the terms are observed to proceed. This law is often easily discovered from a few of the first terms of the series; and then the series may be continued as far as may be thought necessary, without any farther division or evolution. An infinite series is obtained by division or evolution; but, as that method is very tedious, various other methods have been proposed for performing the

same in a more easy manner; as, by assuming series with unknown coefficients, by the binomial theorem, &c.

SERIES, INFINITE, method of, by division and evolution.—Rule. Let the division or evolution of the given fraction which is to be converted into an infinite series, performed as in Chap. I. and IV. of the article ALGEBRA, and the required series will be obtained. Examples. 1.

Convert the fraction $\frac{1}{1-x}$ into an infinite series.

$$\begin{array}{r} (1-x) \frac{1}{1-x} \quad (1+x+x^2+x^3+x^4, \&c. \\ \hline 1-x \\ \hline x \\ \hline x-x^2 \\ \hline x^2 \\ \hline x^2-x^3 \\ \hline x^3 \\ \hline x^3-x^4 \\ \hline x^4 \\ \hline x^4-x^5 \\ \hline x^5 \end{array}$$

Hence the fraction $\frac{1}{1-x} = 1 + x + x^2 + x^3 + x^4, \&c.$ From inspection of the terms of this series, it appears that each term is formed by multiplying the preceding term by x ; and hence it may be continued as far as may be thought necessary without continuing the division.

2. Let the fraction $\frac{a y}{1+x}$ be converted into an infinite series.

$$(1+x) a y \quad (a y - a y x + a y x^2 - a y x^3 + a y x^4, \&c.)$$

$$\begin{array}{r} a y + a x \\ \hline - a y x \\ \hline - a y x - a y x^2 \\ \hline a y x^2 \\ \hline a y x^2 + a y x^3 \\ \hline - a y x^3 \\ \hline - a y x^3 - a y x^4 \\ \hline a y x^4 \\ \hline a y x^4 + a y x^5 \\ \hline - a y x^5 \end{array}$$

Hence $\frac{a y}{1+x} = a y \times 1 - x + x^2 - x^3 + x^4, \&c.$, and the law of the series is obvious.

3. Reduce the fraction $\frac{m^2 + x^2}{m + x}$ into an infinite series.

$$\begin{array}{r} (m+x) m^2 + x^2 (m-x + \frac{2 x^2}{m} - \frac{2 x^3}{m^2} + \frac{2 x^4}{m^3}, \&c. \\ \hline m^2 + m x \\ \hline - m x + x^2 \\ \hline - m x - x^2 \\ \hline 2 x^2 \end{array}$$

$$2x^2 + \frac{2x^3}{m}$$

$$2x^3$$

$$m$$

$$2x^3 \quad 2x^4$$

$$\frac{2x^4}{m^2}, \&c.$$

Hence $\frac{m^2 + x^2}{m + x} = m - x + \frac{2x}{m} + \frac{x^2}{m^2} + \frac{x^3}{m^3}$
&c., and the laws of the series is evident.

4. Convert the quantity $\frac{a^2}{a^2 + 2ay + y^2}$ into an infinite series.

$$a^2 + 2ay + y^2 \quad (1 - \frac{2y}{a} + \frac{3y^2}{a^2} - \frac{4y^3}{a^3}, \&c.$$

$$a^2 + 2ay + y^2$$

$$-2ay - y^2$$

$$-2ay - 4y^2 - \frac{2y^3}{a}$$

$$3y^2 + \frac{2y^3}{a}$$

$$3y^2 + \frac{6y^3}{a} + \frac{3y^4}{a^2}$$

$$\frac{4y^3}{a} - \frac{3y^4}{a^2}$$

Whence $\frac{a^2}{a^2 + 2ay + y^2} = 1 - \frac{2y}{a} + \frac{3y^2}{a^2} - \frac{4y^3}{a^3}$,
&c.; and each term is found by multiplying the
preceding by $\frac{y}{a}$ and increasing the coefficient by
unity.

5. Let $\sqrt{a^2 + x^2}$ be converted into an infinite series.

$$\frac{a^2 + x^2}{a^2} = 1 + \frac{x^2}{2a^2} + \frac{x^4}{8a^4} + \frac{x^6}{16a^6} + \frac{x^8}{128a^8}$$

$$2a + \frac{x^2}{2a} \times \frac{x^4}{4a^3}$$

$$2a + \frac{x^2}{a} - \frac{x^4}{8a^3} \times \frac{x^6}{4a^5}$$

$$\frac{x^4}{4a^2} - \frac{x^6}{8a^4} + \frac{x^8}{64a^6}$$

$$a + \frac{x^2}{4a^3} + \frac{x^6}{16a^5} \times \frac{x^8}{8a^7} - \frac{x^6}{8a^4} + \frac{x^{10}}{16a^6} - \frac{x^{12}}{256a^{10}}$$

Hence the square root of $a^2 + x^2 = a + \frac{x^2}{2a} - \frac{x^4}{8a^3}$
+ $\frac{x^6}{16a^5} - \frac{x^8}{128a^7}$, &c.

In continuing the operation, those terms may be

neglected whose dimensions exceed those of the last term to which the root is to be continued.

SERIES, INFINITE, method of, by the assumption of a series with unknown coefficients. — *Rule.* Assume a series with unknown coefficients to represent that required. Let this series be multiplied or involved, according to the nature of the question; and, the quantities of the same dimension being put equal to each other, the coefficients will be determined; and hence the required series will be known.

Examples. 1. Let $\frac{1}{a-x}$ be converted into an infinite series. Assume $\frac{1}{a-x} = A + Bx + Cx^2$
+ $Dx^3 + Ex^4$, &c.

Then this assumed series multiplied by $a-x$ gives $1 = aA + aBx + aCx^2 + aDx^3 + aEx^4$, &c., — $Ax - Bx^2 - Cx^3 - Dx^4$, &c.

Now, by equating the coefficients of the same powers of x , we have $aA = 1$, $aB = 0$, $aC = -B = 0$, $aD = -C = 0$, $aE = -D = 0$, &c. Hence

$$A = \frac{1}{a}, B = \frac{A}{a} = \frac{1}{a^2}, C = \frac{B}{a} = \frac{1}{a^3}, D = \frac{C}{a} =$$

$$\frac{1}{a^4}, E = \frac{D}{a} = \frac{1}{a^5}, \&c.; \text{ whence, by substitution, we have } \frac{1}{a-x} = \frac{1}{a} + \frac{x}{a^2} + \frac{x^2}{a^3} + \frac{x^3}{a^4} + \frac{x^4}{a^5},$$

&c.

2. Convert the quantity $\frac{c^2}{c^2 + 2cy - y^2}$ into an infinite series. Let the assumed series be $A + By + Cy^2 + Dy^3$, which multiplied by $c^2 + 2cy - y^2$, gives

$$c^2 = c^2A + c^2By + c^2Cy^2 + c^2Dy^3, \&c.
+ 2cAy + 2cBy^2 + 2cCy^3
- Ay^2 - By^3.$$

Now, by equating the coefficients of the homologous terms, we have $c^2 = c^2A$, $c^2B + 2cA = 0$, $c^2C + 2cB - A = 0$, $c^2D + 2cC - B = 0$, &c.; whence $A = 1$, $B = -\frac{2A}{c} = -\frac{2}{c}$, $C =$

$$\frac{A - 2cB}{c^2} = \frac{1 + 4}{c^2} = \frac{5}{c^2}, D = \frac{B - 2cC}{c^2} =$$

$$\frac{-2 - 10}{c^3} = -\frac{12}{c^3}, \&c.; \text{ whence } \frac{c^2}{c^2 + 2cy - y^2} =$$

$$1 - \frac{2y}{c} + \frac{5y^2}{c^2} - \frac{12y^3}{c^3}, \&c.$$

3. Required the square root of $a^2 - x^2$. Let $a^2 - x^2 \frac{1}{2} = A + Bx^2 + Cx^4 + Dx^6$, &c., which being squared gives $a^2 - x^2 = A^2 + 2ABx^2 + 2ACx^4 + 2BCx^6$, &c.,

$$\text{Hence } A^2 = a^2, 2AB + 1 = 0, B^2 + 2AC = 0, 2AD + 2BC = 0, \&c. \text{ Then } A = a, B =$$

$$-\frac{1}{2A} = -\frac{1}{2a}, C = -\frac{B^2}{2A} = \frac{1}{8a^3}, D = -\frac{BC}{A} =$$

$$-\frac{1}{16a^5}, \&c.; \text{ whence } a^2 - x^2 \frac{1}{2} = a - \frac{x^2}{2a} -$$

$$\frac{x^4}{8a^3} - \frac{x^6}{16a^5}, \&c.$$

Surd and fractional quantities may be reduced to infinite series by the binomial theorem, which may be consulted. See ALGEBRA and BINOMIAL.

An infinite series may be involved to any given power, or any proposed root of a given series may be extracted by means of the following general theorem:— $z^m \propto (a + bx + cx^2 + dx^3 + ex^4, \&c., = z^n$, multiplied by

$$\left. \begin{aligned} & a^m + mba^{m-1}x + m \cdot \frac{m-1}{2} \cdot a^{m-2}b^2x^2 \\ & \quad + ma^{m-1}c \end{aligned} \right\} x^1$$

$$\left. \begin{aligned} & + m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot a^{m-3}b^3 \\ & + m \cdot \frac{m-1}{2} \cdot 2a^{m-2}bc \\ & + ma^{m-1}d \end{aligned} \right\} x^3$$

$$\left. \begin{aligned} & \times m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot \frac{m-3}{4} \cdot a^{m-4}b^4 \\ & + m \cdot \frac{m-2}{2} \cdot \frac{m-2}{3} \cdot \frac{m-3}{4} \cdot 3a^{m-3}b^2c \\ & + m \cdot \frac{m-1}{2} \cdot a^{m-2} \left\{ \begin{array}{l} 2bd \\ + c^2 \end{array} \right\} \\ & + ma^{m-1}e \end{aligned} \right\} x^4$$

$$\left. \begin{aligned} & + m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot \frac{m-3}{4} \cdot \frac{m-4}{5} \cdot a^{m-5}b^5 \\ & + m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot \frac{m-3}{4} \cdot 4a^{m-4}b^3c \\ & + m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot 3a^{m-3} \left\{ \begin{array}{l} bc^2 \\ + b^2d \end{array} \right\} \\ & + m \cdot \frac{m-1}{2} \cdot 2a^{m-2} \left\{ \begin{array}{l} cd \\ + be \end{array} \right\} \\ & + ma^{m-1}f \end{aligned} \right\} x^5$$

$$\left. \begin{aligned} & + m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot \frac{m-3}{4} \cdot \frac{m-4}{5} \cdot \frac{m-5}{6} \cdot a^{m-6}b^6 \\ & + m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot \frac{m-3}{4} \cdot \frac{m-4}{5} \cdot 5a^{m-5}b^4c \\ & + m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot \frac{m-3}{4} \cdot a^{m-4} \left\{ \begin{array}{l} 6b^2c^2 \\ 4b^3d \\ 3b^2e \\ 6bcd \end{array} \right\} \\ & + m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot a^{m-3} \left\{ \begin{array}{l} 2bf \\ 2cc \\ d^2 \end{array} \right\} \\ & + ma^{m-1}g \end{aligned} \right\} x^6$$

Now each term of the given series is to be compared with the correspondent terms in the first part of the above theorem; and, by substitution in the second, several terms of the required series will be obtained.

Example 1.—What is the square of the series $y - y^3 + y^5 - y^7 + \&c.$?

By comparing this with the general theorem, we find $z = y$, $a = 1$, $b = 0$, $c = -1$, $d = 0$, $g = -1$, $\&c.$, and $m = 2$; whence $y - y^3 + y^5 - y^7 + \&c. = z^2 y^2 \times (1 - 2ax + c^2x^4 - 2cex^6, \&c., = y^2$

$\times (1 - 2y^2 + 3y^4 - 4y^6, \&c., = y^2 - 2y^4 + 3y^6 - 4y^8, \&c.$

2. Required the fourth power of the series $1 + x + x^2 + x^3, \&c.$

Here $z = 1$, $a = 1$, $b = 1$, $c = 1$, $d = 1$, and $m = 4$.

$$\begin{aligned} \text{Then } 1 + x + x^2 + x^3, \&c. \{ &= 1 + 4bx + 6b^2x^2 + 4b^3x^3 + b^4x^4, \&c. \\ &+ 4c \quad + 12bc \quad + 12b^2c \\ &+ 4d \quad + 6c^2 \\ &+ 12bd \\ &+ 4e \\ &= 1 + 4x + 10x^2 + 20x^3 + 35x^4, \&c. \end{aligned}$$

SERIES, RECURRING, a series of which any term is formed by the addition of a certain number of preceding terms, multiplied or divided by any determinate numbers, whether positive or negative. Thus 2, 3, 19, 101, 543, 2917, 15671, $\&c.$, is a recurring series, each term of which is formed by the addition of the two preceding terms, the first of which being previously multiplied by the constant quantity 2 and the other by 5. Thus the third term $19 = 2 \times 2 + 3 \times 5$; the fourth term $101 = 2 \times 3 + 19 \times 5, \&c.$ The principal operation in a series of this nature is that of finding its sum.—For this purpose, the two first and two last terms of the series must be given, together with the constant multipliers. Let $a, b, c, d, e, f, \&c.$, be any number of terms of a series formed according to the above law, each successive term being equal to the sum of the products of the two preceding terms, the first being multiplied by the given quantity m , and the other by the given quantity n . Hence we shall have the following series of equations $c = ma + nb$, $d = mb + nc$, $e = mc + nd$, $f = md + ne$, $\&c.$ Then adding these equations, we obtain $c + d + f + \&c. = m \times a + b + c + d + n \times b + c + d + e$. Now the first member of this equation is the sum

of all the terms except the two first; the quantity by which m is multiplied, in the second member, is the sum of all the terms except the two last; and that by which n is multiplied is the sum of all the terms except the first and last. Now let $s =$ sum of the series; then $s - a - b = m \times s - c - f + n \times s - a - f$. Hence $s = \frac{m \times c \times f \times n \times a \times f - a - b}{m + n - 1}$. Let the sum of the first seven terms of the above series be required.

Two last terms	{ 15671	First term	2
	2917	Last term	15671
Sum	18588	Sum	15673
m	2	n	5
	37176		78364
	78365		
Sum	115541		
$-2+3$	5		
$2+5-1=6$	115536		
	19256	= sum of the series	

SERIES, REVERSION OF, is the method of finding the value of the quantity whose several powers are involved in a series, in terms of the quantity which is equal to the given series. In order to this, a series must be assumed; which being involved and substituted for the quantity equal to the series, and its powers, neglecting those terms whose powers exceed the highest power to which it is proposed to extend the series. Let it be required to revert the series $ax + bx^2 + cx^3 + dx^4 + ex^5$, &c. $= y$; or, to find x in an infinite series expressed in the powers of y . Substitute y^n for x , and the indices of the powers of y in the equation will be $n, 2n, 3n$, &c., and 1, therefore $n = 1$; and the differences are 0, 1, 2, 3, 4, 5, &c. Hence, in this case, the series to be assumed is $Ay + By^2 + Cy^3 + Dy^4$, &c., which being involved, and substituted for the respective powers of x , then we have

$$\begin{aligned} ax &= aAy + aBy^2 + aCy^3 + aDy^4, & \&c. \\ bx^2 &= bA^2y^2 + 2bABy^3 + 2bACy^4 + bB^2y^4, & \&c. \\ cx^3 &= cA^3y^3 + 3cA^2By^4 + cA^2Cy^4, & \&c. \\ dx^4 &= dA^4y^4, & \&c. \end{aligned} \quad \left. \begin{aligned} & \\ & \\ & \\ & \end{aligned} \right\} = y$$

Whence, by comparing the homologous terms, we have $aAy = y$; therefore $A = \frac{1}{a}$, $B = \frac{b}{a^2}$,

$$\begin{aligned} C &= \frac{2bAB + cA^3}{a} = \frac{2b^2 - ac}{a^3}; \quad D \\ &= \frac{2bAC + bB^2 + 3cA^2B + dA^4}{a} = \\ &= \frac{5abc - 5b^2 - a^2d}{a^7}, & \&c., \text{ and consequently } x = \\ &= \frac{y}{a} - \frac{by^2}{a^3} + \frac{2b^2 - ac}{a^5} \times y^3 - \frac{5b^2 - 5abc + a^2d}{a^7} y^4, & \&c. \end{aligned}$$

Example 1.—Let $x = \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4}$, &c., $= y$. Then a being in this case equal to 1, $b = -\frac{1}{2}$, $c = \frac{1}{3}$, $d = -\frac{1}{4}$, &c., we shall, by substituting these values, have $x = y + \frac{y^2}{2} + \frac{y^3}{6} + \frac{y^4}{24}$, &c.

2. Let $x = x^2 + x^3 - x^4 + x^5$, &c., $= y$; to find x . In this example we have $x = x$, $a = 1$, $b = -1$, $c = 1$, $d = -1$, &c.; whence $x = \frac{y}{1} + \frac{1}{1}y^2 + \frac{2-1}{1}y^3 + \frac{-5+5-1}{1}y^4$, &c., $= y + y^2 + y^3 + y^4$, &c.

3. Let $a = r = \frac{x^2}{2r} + \frac{x^4}{24r^3} + \frac{x^6}{720r^5} + \frac{x^8}{4032r^7}$, &c., to find x .

Put $r - a = v$; then $v = \frac{x^2}{2r} - \frac{x^4}{24r^3} + \frac{x^6}{720r^5} - \frac{x^8}{4032r^7}$, &c. By comparison we find $x = x^2$, $y = v$, $a = \frac{1}{2r}$, $b = -\frac{1}{24r^3}$, $c = \frac{1}{720r^5}$, $d = -\frac{1}{4032r^7}$, &c.

$$\text{Hence } x^2 = 2rv = \frac{-1}{24r^3}v^2 + \frac{1}{288r^6} - \frac{1}{1440r^6}$$

$$\begin{aligned} v^3, &\&c., = 2rv + \frac{1}{3}v^3 + \frac{4}{45r}v^3 + \frac{1}{35r^3}v^4, \\ &\&c., \text{ whence } x = \sqrt{2rv} \times \left(1 + \frac{v}{12r} + \frac{3v}{160r^2} + \frac{5r^6}{896r^2}\right) \&c. \end{aligned}$$

SERIES, SUMMATION OF, is the method of finding the sum of the terms of an infinite series produced to infinity, or the sum of any number of terms of such a series. The value of any arithmetical series, as $1^2 + 2^2 + 3^2 + 4^2 + \dots + n^2$ varies according as (n) the number of its terms varies: and, therefore, if it can be expressed in a general manner, it must be explicable by n , and its powers with determinate coefficients; and those powers, in this case, must be rational, or such whose indices are whole positive numbers; because the progression, being a whole number, cannot admit of surd quantities. Lastly, it will appear that the greatest of the said indices cannot exceed the common index of the series by more than unity: for, otherwise, when n is taken indefinitely great, the highest power of n would be indefinitely greater than the sum of all the rest of the terms. Thus the highest power of n in an expression exhibiting the value of $1^2 + 2^2 + 3^2 + 4^2 + \dots + n^2$, cannot be greater than n^3 ; for $1^2 + 2^2 + 3^2 + 4^2 + \dots + n^2$ is manifestly less than n^3 , or $n^3 + n^2 + n^2 + \dots$, &c., continued to n terms; but n^4 , when n is indefinitely great, is indefinitely greater than n^3 , or any other inferior power of n , and therefore cannot enter into the equation. This being premised, the method of investigation may be as follows:—

Example 1.—Required the sum of n terms of the series $1 + 2 + 3 + 4 + \dots + n$. Let $An^2 + Bn$ be assumed, according to the foregoing observations, as a universal expression for the value of $1 + 2 + 3 + 4 + \dots + n$, where A and B represent unknown but determinate quantities. Therefore, since the equation is supposed to hold universally, whatsoever is the number of terms, it is evident that if the number of terms be increased by unity, or, which is the same thing, if $n + 1$ be written therein instead of n , the equation will still subsist; and we shall have $A \times \frac{n+1}{2} + B \times n + 1 = 1 + 2 + 3 + 4 + \dots + n + n + 1$. From which the first equation being subtracted, there remains $A \times \frac{n+1}{2} - An^2 + B + n - 1 = Bn = n + 1$; this contracted will be $2An + A + B = n + 1$; whence we have $2A - 1 \times n + A + B - 1 = 0$: Wherefore by taking $2A - 1 = 0$, and $A + B - 1 = 0$, we have $A = \frac{1}{2}$, and $B = \frac{1}{2}$; and consequently $1 + 2 + 3 + 4 + \dots + n (= An^2 + Bn) = \frac{n^2}{2} + \frac{n}{2} = \frac{n \times n + 1}{2}$.

What is the sum of the ten first terms of the series $1 + 2 + 3$, &c.?

In this case $n = 10$, then $\frac{n \times n + 1}{2} = \frac{10 \times 11}{2} = 55$.

2. Required the sum of the series $1^2 + 2^2 + 3^2 + \dots + n^2$, or $1 + 4 + 9 + 16 + \dots + n$. Let An^3

+ $B n^3 + C n$, according to the aforesaid observations, be assumed $= 1^2 + 2^2 + 3^2 \dots n^2$; then, as in the preceding case, we shall have $A \times n + 1^3 + B \times n + 1^2 + C \times n + 1 = 1^2 + 2^2 + 3^2 \dots n^2 \times n + 1^2$; that is, by involving $n + 1$ to its several powers, $A n^3 + 3 A n^2 + 3 A n + A + B n^2 + 2 B n + B + C n + C = 1^2 + 2^2 + 3^2 \dots n^2 + n + 1^2$; from which subtracting the former equation, we obtain $3 A n^2 + 3 A n + A + 2 B n + B + C (= n + 1)^2 = n^2 + 2 n + 1$; and consequently $3 A - 1 \times n^2 + 3 A + 2 B - 2 \times n + A + B + C - 1 = 0$; whence $3 A - 1 = 0$, $A + 2 B - 2 = 0$, and $A + B + C - 1 = 0$; therefore $A = \frac{1}{3}$, $B = \frac{2-3A}{3} = \frac{1}{3}$, $C = 1 - A - B = \frac{1}{3}$, and consequently $1 + \frac{1}{3} + \frac{1}{3} + \frac{1}{3} \dots n^2 = \frac{n^2}{3} + \frac{n^2}{2} + \frac{n}{6}$, or $\frac{n \cdot n + 1}{6} \cdot \frac{2n + 1}{2} = \frac{n^2 + n^2 + n}{6}$.

What is the sum of the ten first terms of the series $1^2 + 2^2 + 3^2$, &c.? Here $n = 10$, then $n \frac{n+1 \cdot 2n+1}{6} = \frac{10 \times 11 \cdot 21}{6} = 385$.

3. Let the sum of the series $\frac{n-1}{n R} + \frac{n-2}{n R^2}$

+ $\frac{n-3}{n R^2}$ &c., be required? This series is equal to the difference of the two following:—

First, $\frac{n}{n R} + \frac{n}{n R^2} + \frac{n}{n R^2}$, &c., $= \frac{1}{R} + \frac{1}{R^2}$ + $\frac{1}{R^2}$, &c., $= \frac{1-a}{r}$.

Second, $\frac{1}{n R} + \frac{2}{n R^2} + \frac{3}{n R^3}$, &c., $= \frac{1}{n} + \frac{1}{R} + \frac{1}{R^2} + \frac{1}{R^3}$, &c., $= \frac{1}{n} \times \frac{1-a}{r} \times R$.

The difference of these series is $\frac{1-a}{r} - \frac{1-a}{n} \times \frac{R}{r}$, which reduced becomes $\frac{n + a - 1 \times r + a - 1}{n r^2}$.

To proceed farther would lead us far beyond the limits assigned for this article; we must therefore refer those who require more information on this subject to the following authors:—Bertrand's *Developement*, &c., vol. 1; Dodson's *Mathematical Repository*, vol. 1; Emerson's *Algebra*; Appendix to Gravesend's *Algebra*; Hutton's *Paper on Cubic Equations and Infinite Series*, in the *Philosophical Transactions* for 1780; Maclaurin's *Fluxions*; Malcolm's *Arithmetic*; Masere's *Annuities*; and *Scriptores Logarithmici*, &c.; De Moivre's *Doctrine of Chances*, and a Paper by the same author in the *Philosophical Transactions*, No. 240; Simpson's *Algebra*, *Essays*, *Fluxions*, and *Miscellanies*; Stirling's *Summatio et Interpolatio Serierum*; Syntagma *Mathesios*, &c.

SERINAGUR, or Gerwall, a principality of Hindostan, situated chiefly between 30° and 32° of N. lat., and between 77° and 79° of E. long. It is estimated at 140 miles in length by sixty in breadth, and is an assemblage

of hills or mountains, some of which are covered with trees, others bare rocks. The valleys are fertile, but confined. It produces the oak, and several other European trees and fruits; and a number of elephants. Previous to the invasion of Serinagur by the Nepaulese, the revenue was estimated at £65,000 per annum, and was governed by a Hindoo prince, whose authority was absolute. It produces a considerable quantity of copper and some gold. The animals used for the transport of its traffic are sheep and goats, which are loaded with small sacks, containing about twelve pounds of borax, salt, or grain, &c., and travel in flocks of 100 or 200, guarded by dogs and a few shepherds, led on by a stout ram, bearing a large bell, and travel at the rate of ten or fifteen miles per day. The natives are, generally speaking, Hindoos.

This country does not appear ever to have been conquered by the Mahometans; but tribute was frequently exacted from it. In the year 1791 the Nepaulese invaded Serinagur; but the rajah having collected about 5000 men, armed with matchlocks, bows and arrows, &c., defended the passes and a fortress called Sunggur, with such perseverance, that the invaders were compelled to retreat; but in the year 1803 the rajah of Nepal marched in person at the head of his army, and was met at the village of Gurudwara, by the Serinagur chief with a very inferior force. A bloody battle ensued, in which the latter with a number of his followers were killed. After this the Nepaulese became complete masters of the country, and divided into numerous subdivisions, over each of which they appointed a native superintendent. During the war between the Nepaulese and the British, in 1815 and 1816, a relation of the late rajah having joined the latter, was admitted as an auxiliary, and at the conclusion of the peace was re-established in his principality, and the Nepaulese compelled to resign every claim on the country. Serinagur may be therefore now considered as entirely under the British protection and influence.

SERINAGUR, the capital of the above province, is situated in a valley of three miles in length, watered by the river Alcananda. The town is about three-quarters of a mile in length. The houses, of rough stone and mud, are covered with slate, but are seldom more than two stories high. The palace of the rajah is, however, elevated to four stories. The streets are narrow and dirty, but there are some good shops. The river is about eighty yards wide in the dry season, and is crossed by means of a bridge of ropes. Except about seventy Mahometan families the inhabitants are Hindoos. On the opposite side of the river is a celebrated temple, dedicated to Ishwara, which is attended by a number of dancing girls, who are accused of being very licentious. The air is unfavorable to foreigners. Long. $79^\circ 18'$ E., lat. $30^\circ 11'$ N.

SERINGAPATAM, or SIRI RUNGA PATAN, a city of the south of India, once the capital of the province of Mysore, is situated at the upper end of an island of four miles in length, by one and a half in breadth, in the Cavery. It has existed as a fortress from an early period; but in the year 1610 was taken from the viceroy of

the dynasty of Bijanagur, by rajah Wadeyar, and made his capital of Mysore. His successors continued to enlarge the town, and increase its fortifications; but it was not till the reigns of Hyder Aly and Tippoo Sultan that it attained its first degree of splendor and strength. It was frequently besieged by the Mahrattas and by the Nizam, but without any other effect than compelling Hyder to pay sums of money. In February 1792 it was invested by the British and allied armies, under the command of lord Cornwallis, amounting, with their followers, to the immense number of 400,000 men. Terrified by such a host, Tippoo Sultan relinquished half his dominions, and paid the sum of three millions and a half sterling to the conquerors. In 1799, a war having again broken out between the British and Mysore, Seringapatam was again invested by the British and Nizam's forces, on the 14th of April, and was stormed about two o'clock in the afternoon of the 4th of May. On this occasion Tippoo Sultan, and nearly 8000 of his followers, fell, and the whole of his family and treasures were taken by the conquerors. Previous to the siege, the city and island are said to have contained 150,000 inhabitants; but in the following year the number of inhabitants was reduced to less than 32,000. Seringapatam has of course declined since, and, having proved unhealthy, it has been in contemplation to demolish the fortifications. By the treaty made with the allied powers, Seringapatam became the property of the British, and is now protected by a garrison, and is the residence of a judge, collector, &c. Besides the city, the island contains a very celebrated temple, dedicated to Vishnu, and a handsome garden, called the Loll Bang, in which are deposited the remains of Hyder Aly and his son Tippoo Sultan under a handsome mausoleum. See **MYSOORE**.

SERINGHAM, an island of Hindostan, formed about six miles north-west of Trinchinopoly by the river Cavery, which divides itself into two branches; that to the northward takes the name of Coleroon, but the southern branch preserves its name the Cavery. Each of these rivers, after a course of about ninety miles, falls into the sea; the Coleroon at Devicottah, and the Cavery near Tranquebar, about twenty miles from each other. In this island, facing Trinchinopoly, stood a famous pagoda surrounded by seven square walls of stone, twenty-five feet high and four feet thick. The space between the outward and second walls measured 310 feet, and so proportionably of the rest. Each enclosure had four large gates, with a high tower; which were placed, one in the middle of each side of the enclosure, and opposite to the four cardinal points. The outward wall was about four miles in circumference, and its gateway to the south was ornamented with pillars, some of which were single stones thirty-three feet in length and five in diameter; while those that formed the roof were still larger; and in the innermost enclosure were the chapels. About half a mile to the east was another large pagoda called Jumbikistna, which had but one enclosure. The pagoda of Seringham was held in great veneration, from a belief that it contained the

identical image of the god Vishnu; and pilgrims came here from all parts of India with offerings of money to procure absolution. A large part of the revenue of the island was allotted for the maintenance of the Brahmins who inhabited the pagoda; and these, with their families, formerly amounted to no fewer than 40,000 persons, all maintained by the superstitious liberality of the adjacent country.

SERIOLA, in botany, a genus of plants belonging to the order of polygamia æqualis, and to the class of syngenesia; natural order forty-ninth, compositæ. The receptacle is paleaceous; the pappus is somewhat plumose. There are four species. 1. *S. Æthnensis*, a native of Italy. 2. *S. Cretensis*, a plant of Crete. 3. *S. levigata*, another native of Crete or Candia, which flowers in July and August. 4. *S. urens*, the burning seriola, is a native of the South of Europe.

SERIOUS, *adj.* } Fr. *serieux*; Lat. *serius*.
SERIOUSLY, *adv.* } Grave; solemn; not vo-
SERIOUSNESS, *n.s.* } latile, or light of beha-
 viour: the adverb and noun substantive corre-
 sponding.

I'll hence to London on a serious matter.

Shakspeare. Henry VI.

There's nothing serious in mortality!

All is but toys.

Id. Macbeth.

All laugh to find

Unthinking plainness so o'erspread thy mind,

That thou couldest seriously persuade the crowd

To keep their oaths, and to believe a God. *Dryden.*

It cannot but be matter of very dreadful consideration to any one, sober and in his wits, to think seriously with himself, what horror and confusion must needs surprise that man, at the last day of account, who had led his whole life by one rule, when God intends to judge him by another. *South.*

Justin Martyr, Tertullian, Lactantius, and Arnobius, tell us, that this martyrdom first of all made them seriously inquisitive into that religion, which could induce the mind with so much strength, and overcome the fear of death. nay, raise an earnest desire of it, though it appeared in all its terrors.

Addison.

The youth was received at the door by a servant, who then conducted him with great silence and seriousness to a long gallery, which was darkened at noon day.

Id. Spectator.

That spirit of religion and seriousness vanished all at once, and a spirit of libertinism and profaneness started up in the room of it.

Atterbury's Sermons.

Ah! my friends, while we laugh, all things are serious round about us: God is serious, who exerciseth patience towards us: Christ is serious, who shed his blood for us; the Holy Ghost is serious, who striveth against the obstinacy of our hearts; the holy Scriptures bring to our ears the most serious things in the world; the Holy Sacraments represent the most serious and awful matters; the whole creation is serious in serving God, and us; all that are in heaven or hell are serious; how then can we be gay? To give these excellent words their full force, it should be known that they came not from the priesthood, but the court: and from a courtier as eminent as England ever boasted. *Young.*

SERIPERES, the lowest and most degraded class of the meanest tribe of Hindoos. See **PARIAS**.

SERIPHIA RANA, a proverbial saying concerning a person who can neither sing nor say; frogs in Seriphus being said to be dumb.—Pliny.

SERIPHII, the ancient people of Seriphus, who, together with the Siphnii, joined Greece against Xerxes, and were almost the only islanders who refused to give him earth and water in token of submission.—Herodotus.

SERIPHNUM, in botany, a genus of plants belonging to the order of monogamia, and to the class of syngenesia: *cal.* imbricated: *cor.* monopetalous and regular, with one oblong seed under it. There is only one species. *S. cinereum*, a native of the Cape of Good Hope.

SERIPHOS, or **SERIPHUS**, in ancient geography, one of the Cyclades or islands in the Ægean Sea, called *Saxum Seriphium* by Tacitus, as if all a rock. It was one of the usual places of banishment among the Romans. It was on the coast of Seriphus that the chest was discovered, according to the poets, in which king Acrisius had exposed his daughter **DANAË**, and her son **PERSEUS** (see these articles). It is now called Serphos, or Sero.

SERMON, *n. s.* & *v. a.* } *Fr.* *sermon*; *Lat.*

SERMOCINATOR. } *Sermo*. A discourse of instruction for the edification of the people: to make sermons: a sermocinator is a preacher or speech-maker.

As for our *sermons*, be they never so sound and perfect, God's word they are not, as the *sermons* of the prophets were; no, they are but ambiguously termed his word, because his word is commonly the subject whereof they treat, and must be the rule whereby they are framed. *Hooker.*

Some would rather have good discipline delivered plainly by way of precept, or *sermoned* at large, than thus cloudily inwrapped in allegorical devices. *Spenser.*

This our life, exempt from public haunt,
Finds tongues in trees, books in the running brooks,
Sermons in stones, and good in every thing. *Shakspeare.*

Come, *sermon* me no farther:
No villainous bounty yet hath passed my heart. *Id. Timon.*

Sermons he heard, yet not so many
As left no time to practise any:
He heard them reverently, and then
His practice preached them o'er again. *Crashaw.*

These obstreperous *sermocinators* make easy impression upon the minds of the vulgar. *Houel.*

His preaching much, but more his practice wrought;
A living *sermon* of the truths he taught. *Dryden.*

Many, while they have preached Christ in their *sermons*, have read a lecture of atheism in their practice. *South.*

SEROUS, *adj.* } *Fr.* *seroux*; *Lat.* *serosus*
SEROSITY, *n. s.* } Thin; watery: the noun substantive corresponding.

In these the salt and lixiviated *serosity* is divided between the guts and the bladder; but it remains undivided in birds. *Browne.*

The tumour of the throat, which occasions the difficulty of swallowing, and breathing, proceeds from a *serosity* obstructing the glands, which may be watery, œdematose, or schirrhous, according to the viscosity of the humour. *Arbuthnot.*

This disease is commonly an extravasation of serum, received in some cavity of the body; for there may be also a dropsy by a dilatation of the *serous* vessels, as that in the ovarium. *Id. on Diet.*

SERPENS, in astronomy, a constellation in the northern hemisphere, called also *serpens ophiuchi*. See **ASTRONOMY**.

SERPENS, the serpent, in the Linnæan system of zoology, an order of animals belonging to the class of amphibia, and comprehending six genera, viz. the **CROTALUS**, or rattle-snake; the **BOA**; the **COLUBER**, or viper; the **ANGUIS**, or snake; the **AMPHIBÆNA**, or annulated snake; and the **CÆCILIA**, or tentaculated snake, the body and tail of which are wrinkled, without scales, and the upper part furnished with two feelers. See these articles. The characters of serpents are these: they are amphibious animals, breathing through the mouth by means of lungs only; having a tapering body, no distinct neck; the jaws not articulated, but dilatable, and destitute of feet, fins, and cars.

SERPENS BICEPS, the double-headed snake; a monster of the serpent kind, there being no permanent species of this conformation. That represented by Edwards came from the island of Barbadoes; and was said to have been taken out of an egg of the size of a small pullet's egg by a man who found it under ground as he was digging. The heads were not in an horizontal position when the snake lay on its belly, but inclined to each other on their under sides, leaving an opening for the throat to come in between the two heads underneath. The upper side, for the whole length, was covered with small scales, falling one over another; the belly was covered with single scales running across it, in the form of half rings. It was all over of a yellowish color, without any spots or variation. Mr. Edwards also informs us that a person brought to him a common English snake, which had two heads quite separate from each other, the necks parting about an inch from the head.

SERPENT, *n. s.* } *Lat.* *serpens*. An animal
SERPENTINE, *adj.* } mal that moves by undulation without legs: the adjective corresponding See below.

His hand the' adorned firmament displayed,
Those *serpentine* yet constant motions made. *Sandys.*

I craved of him to lead me to the top of this rock,
with meaning to free him from so *serpentine* a companion as I am. *Sidney.*

She was arrayed all in lily white,
And in her right hand bore a cup of gold,
With wine and water filled up to the height;
In which a *serpent* did himself enfold,
That horror made to all that did behold. *Færie Queene.*

She struck me with her tongue,
Most *serpent*-like, upon the very heart. *Shakspeare. King Lear.*

Nor can the sun
Perfect a circle, or maintain his way
One inch direct; but where he rose to-day
He comes no more, but with a cozening line
Steals by that point, and so is *serpentine*. *Donne.*

Accept in good part a bottle made of a *serpentine* stone, which hath the quality to give any wine or water, that should be infused therein for four-and twenty-hours, the taste and operation of the spa-

water, and is very medicinal for the cure of the spleen and gravel.

Wotton.

They, or under ground, or circuit wide,
With serpent error wandering, found their way.

Milton.

Nothing wants but that thy shape
Like his, and color *serpentine*, may shew
Thy inward fraud.

Id. *Paradise Lost*.

This of ours is described with legs, wings, a *serpentine* and winding tail, and a crest or comb somewhat like a cock.

Browne.

The figures and their parts ought to have a *serpentine* and flaming form naturally: these sorts of outlines have I know not what of life and seeming motion in them, which very much resembles the activity of the flame and *serpent*.

Dryden.

How many spacious countries doth the Rhine,
In winding banks, and mazes *serpentine*,
Traverse, before he splits in Belgia's plain,
And, lost in sand, creeps to the German main!

Blackmore.

There were three species of this (the *serpent stone*) known among the ancients, all resembling one another, and celebrated for the same virtues. The one was green, variegated with spots of black, thence called the black ophites; another, called the white ophites, was green also, but variegated with spots of white: the third was called tephria, and was of a grey color, variegated with small black spots. The ancients tell us that it was a certain remedy against the poison of the bite of *serpents*; but it is now justly rejected.

Hill's *Materia Medica*.

SERPENTS, ANCIENT ACCOUNTS OF. The serpent has from the beginning been the enemy of man; and it has hitherto continued to terrify and annoy him, notwithstanding all the arts which have been practised to destroy it. Formidable in itself, it deters the invader from the pursuit; and, from its figure, capable of finding shelter in a little space, it is not easily discovered by those who would venture to encounter it. Thus possessed at once of potent arms, and inaccessible or secure retreats, it baffles all the arts of man, though ever so earnestly bent upon its destruction. For this reason, there is scarcely a country in the world that does not still give birth to this poisonous brood. Mankind have driven the lion, the tiger, and the wolf, from their vicinity; but the snake and the viper still defy their power. Their numbers, however, are thinned by human assiduity. In none of the countries of Europe are they sufficiently numerous to be truly terrible. The various malignity that has been ascribed to European serpents of old is now utterly unknown; there are not above three or four kinds that are dangerous, and their poison operates in all in the same manner. The drowsy death, the starting of the blood from every pore, the insatiable and burning thirst, the melting down the solid mass of the whole form into one heap of putrefaction, said to be occasioned by the bites of African serpents, are horrors with which we are entirely unacquainted. But though we have thus reduced these dangers, having been incapable of wholly removing them, in other parts of the world they still rage with all their ancient malignity. In the warm countries within the tropics, as well as in the cold regions of the north, where the inhabitants are few, the serpents propagate in equal proportion. But of all countries those regions have them in the greatest

abundance where the fields are unpeopled and fertile, and where the climate supplies warmth and humidity. All along the swampy banks of the Niger or Oronoco, where the sun is hot, the forests thick, and the men but few, the serpents cling among the branches of the trees in infinite numbers, and carry on an unceasing war against all other animals in their vicinity. Travellers have assured us that they have often seen large snakes twining round the trunk of a tall tree, encompassing it like a wreath, and thus rising and descending at pleasure. We cannot, therefore, reject as wholly fabulous, the accounts given by the ancients of the terrible devastations committed by single serpents. It is probable, in early times, when the arts were little known, and mankind were but thinly scattered over the earth, that serpents, continuing undisturbed possessors of the forest, grew to an amazing magnitude; and every other tribe of animals fell before them. It then might have happened that serpents reigned the tyrants of a district for centuries together. To animals of this kind, grown by time and rapacity to 100 or 150 feet in length, the lion, the tiger, and even the elephant itself, were but feeble opponents. That horrible factor, which even the commonest and the most harmless snakes are still found to diffuse, might, in these larger ones, become too powerful for any living being to withstand, and, while they preyed without distinction, they might thus also have poisoned the atmosphere around them. In this manner, having for ages lived in the hidden and unpeopled forest, and finding the quantity of their prey decreasing, they might venture boldly from their retreats into the more cultivated parts of the country, and carry consternation among mankind. We have many histories of antiquity representing such facts, and exhibiting a whole nation sinking under the ravages of a single serpent. At that time man had not learned the art of uniting the efforts of many to effect one great purpose. The animal was therefore to be singly opposed by him who had the greatest strength, the best armor, and the most undaunted courage. In such an encounter, hundreds must have fallen; till one, more lucky than the rest, by a fortunate blow, or by taking the monster in its torpid interval, and surcharged with spoil, might kill, and thus rid his country of the destroyer. Such was the original occupation of heroes; and those who first obtained that name, from their destroying the ravagers of the earth, gained it much more deservedly than their successors, who acquired their reputation only for their skill in destroying each other. But, as we descend into more enlightened antiquity, we find these animals less formidable, as being attacked in a more successful manner. While Regulus led his army along the banks of the river Bagrada, in Africa, an enormous serpent disputed his passage over it. Pliny says that it was 120 feet long, and that it had destroyed many of the army. At last, however, the battering engines were brought out against it; and these assailing it at a distance, it was soon destroyed. Its spoils were carried to Rome, and the general was decreed an ovation for his success. There are, perhaps, few facts better ascertained in his-

tory than this : an ovation was a remarkable honor ; and was given only for some signal exploit that did not deserve a triumph. See OVATION. The skin was kept for several years after in the capitol ; and Pliny says he saw it there. At present, indeed, such ravages from serpents are scarce seen in any part of the world ; not but that in Africa and America, some of them are powerful enough to brave the assaults of men to this day.

If we take a survey of serpents in general, they have marks by which they are distinguished from all the rest of animated nature. They have the length and the suppleness of the eel, but want fins to swim with ; they have the scaly covering and pointed tail of the lizard, but they want legs to walk with ; they have the crawling motion of the worm, but, unlike that animal, they have lungs to breathe with : like all the reptile kind, they are resentful when offended ; and nature has supplied them with terrible arms to revenge every injury. 1. Though they are possessed of very different degrees of malignity, yet they are all formidable to man, and have a strong similitude of form to each other. With respect to their conformation, all serpents have a very wide mouth in proportion to the size of the head ; and can gape and swallow the head of another animal which is three times as big as their own. However, it is no way surprising that the skin of the snake should stretch to receive so large a morsel ; the wonder seems how the jaws could take it in. But the jaws of this animal do not open as ours, where bones are applied to bones, and play upon one another : on the contrary, the serpent's jaws are held together at the roots by a stretching muscular skin ; by which means they open as widely as the animal chooses to stretch them, and admit of a prey much thicker than the snake's own body. The throat dilates to admit the morsel ; the stomach receives it in part, and the rest remains in the gullet, till putrefaction and the juices of the serpent's body unite to dissolve it. 2. Some serpents have fangs or canine teeth, and others are without them. The teeth in all are crooked and hollow ; and, by a peculiar contrivance, are capable of being erected or depressed at pleasure. 3. The eyes of all serpents are small, if compared to the length of the body ; and though differently colored in different kinds, yet the appearance of all is malign and heavy ; and, from their known qualities, they strike the imagination with the idea of a creature meditating mischief. In some the upper eyelid is wanting, and the serpent winks only with that below ; in others, the animal has a nictitating membrane of skin, resembling that which is found in birds, which keeps the eye clean and preserves the sight. The substance of the eye in all is hard and horny ; the crystalline humor occupying a great part of the globe. 4. The holes for hearing are very visible in all : but there are no conduits for smelling, though it is probable that some of them enjoy that sense in tolerable perfection. The tongue in all these animals is long and forky. It is composed of two long fleshy substances, which terminate in sharp points, and are very pliable. At the root it is connected very strongly to the neck by two

tendons, that give it a variety of play. Some of the viper kind have tongues a fifth part the length of their bodies ; they are continually darting them out ; but they are entirely harmless, and only frighten those who are ignorant of the real situation of their poison. 6. If from the jaws we go on to the gullet, we shall find it very wide for the animal's size, and capable of being distended to a great degree ; at the bottom of this lies the stomach, which is not so capacious, and receives only a part of the prey, while the rest continues in the gullet for digestion. When the substance in the stomach is dissolved into chyle, it passes into the intestines, and thence goes to nourishment, or to be excluded by the vent. 7. Like most other animals, serpents are furnished with lungs, which seem serviceable in breathing, though we cannot perceive the manner in which this operation is performed ; for though serpents are often seen apparently to draw in their breath, yet we cannot find the smallest signs of their ever respiring it again. Their lungs, however, are long and large, and doubtless are necessary to promote their languid circulation. 8. The heart is formed as in the tortoise, the frog, and the lizard kinds, so as to work without the assistance of the lungs. It is single ; the greatest part of the blood flowing from the great vein to the great artery by the shortest course. By this contrivance we easily gather two consequences ; that snakes are amphibious, being equally capable of living on land and in the water ; and that also they are torpid in winter, like the bat, the lizard, &c. 9. The vent in these animals serves for the emission of the urine and the feces, and for the purposes of generation. The instrument of generation in the male is double, being forked like the tongue ; the ovaries in the female are likewise double : and the aperture is very large, in order to receive the double instrument of the male. *They copulate in their retreats. 10. As the body of this animal is long, slender, and capable of bending in every direction, the number of joints in the back-bone are very numerous. In the generality of quadrupeds they amount not to above thirty or forty ; in the serpent kind they amount to 145 from the head to the vent, and twenty-five more from that to the tail. The number of these joints must give the back-bone a surprising degree of pliancy ; but this is increased by the manner in which each of these joints is locked into the other. In man and quadrupeds the flat surfaces of the bones are laid one against the other, and bound tight by sinews ; but in serpents the bones play one within the other, like ball and socket, so that they have full motion upon each other in every direction. 11. Though the number of joints in the back-bone is great, yet that of the ribs is still greater ; for, from the head to the vent, there are two ribs to every joint, which makes their number 290 in all. These ribs are furnished with muscles, four in number ; which, being inserted into the head, run along to the end of the tail, and give the animal great strength and agility in all its motions. 12. The skin also contributes to its motions, being composed of a number of scales, united to each other by a transparent membrane, which grows harder as it

grows older, until the animal changes, which is generally done twice a-year. This cover then bursts near the head, and the serpent creeps from it by an undulatory motion, in a new skin much more vivid than the former. If the old slough be then viewed, every scale will be distinctly seen like a piece of net-work, and will be found greatest where the part of the body they covered was largest. There is much geometrical neatness in the disposal of the serpent's scales, for assisting the animals' sinuous motion. As the edges of the foremost scales lie over the ends of their following scales, so those edges, when the scales are erected, which the animal has a power of doing in a small degree, catch in the ground, like the nails in the wheel of a chariot, and so promote and facilitate the animal's progressive motion. The erecting these scales is by means of a multitude of distinct muscles, with which each is supplied, and one end of which is tacked each to the middle of the foregoing. In some of the serpent kind there is the exactest symmetry in these scales; in others they are disposed more irregularly. In some there are larger scales on the belly, and often answering to the number of ribs; in others, however, the animal is without them. Upon this slight difference Linnaeus has founded his distinction of the various classes of the serpent tribe. 13. When we come to compare serpents with each other, the first distinction appears in their size; no other tribe of animals differing so widely in this particular. This tribe, like that of fishes, seems to have no bounds put to their growth: their bones are in a great measure cartilaginous, and they are consequently capable of great extension: the older, therefore, a serpent becomes, the larger it grows; and, as they seem to live to a great age, they arrive at an enormous size. Legnat assures us that he saw one in Java that was fifty feet long. Carli mentions their growing to above forty feet; and we have now the skin of one in the British Museum that measures thirty-two. Mr. Wentworth, who had large concerns in the Berbices in America, assures us that in that country they grow to an enormous length. He one day sent out a soldier, with an Indian, to kill wild fowl for the table; and they accordingly went some miles from the fort: in pursuing their game, the Indian, who generally marched before, beginning to tire, went to rest himself upon the fallen trunk of a tree, as he supposed it to be; but, when he was just going to sit down, the enormous monster began to move; and the poor savage perceiving that he had approached a boa, the greatest of all the serpent kind, dropped down in an agony. The soldier, who perceived at some distance what had happened, levelled at the serpent's head, and, by a lucky aim, shot it dead: however, he continued his fire until he was assured that the animal was killed; and then going up to rescue his companion, who was fallen motionless by its side, he to his astonishment found him dead likewise, being killed by the fright. Upon his return to the fort, and telling what had happened, Mr. Wentworth ordered the animal to be brought up, when it was measured, and found to be thirty-six feet long. He had the skin stuffed, and then sent to Europe as

a present to the prince of Orange, in whose cabinet it was lately to be seen at the Hague: but the skin is shrunk, by drying, two or three feet. In the East Indies they grow also to an enormous size, particularly at the island of Java, where we are assured that one of them will destroy and devour a buffalo. See Boa. 14. But it is happy for mankind that the gluttony of these frightful creatures is often their punishment; for whenever any of the serpent kind have gorged themselves in this manner, whenever their body is seen particularly distended with food, they then become torpid, and may be approached and destroyed with safety. Patient of hunger to a surprising degree, whenever they seize and swallow their prey, they seem, like surfeited gluttons, unwieldy, stupid, helpless, and sleepy: they at that time seek some retreat, where they may lurk for days together, and digest their meal in safety: the smallest effort at that time is capable of destroying them; they can scarcely make any resistance; and they are equally unqualified for flight or opposition: that is the happy opportunity of attacking them with success; at that time the naked Indian himself does not fear to assail them. But it is otherwise when this sleepy interval of digestion is over; they then issue, with famished appetites, from their retreats, and with accumulated rage, while every animal of the forest flies before them. 15. But though these animals are of all others the most voracious, and though the morsel which they swallow without chewing is greater than what any other creature, either by land or water, can devour; yet no animals upon earth bear abstinence so long as they. A single meal, with many of the snake kind, seems to be the adventure of a season; it is an occurrence of which they have been for weeks, nay sometimes for months, in patient expectation. When they have seized their prey, their industry for several weeks is entirely discontinued; the fortunate capture of an hour often satisfies them for the remaining period of their annual activity. As their blood is colder than that of most other terrestrial animals, and as it circulates but slowly through their bodies, so their powers of digestion are but feeble. Their prey continues, for a long time, partly in the stomach, partly in the gullet, and is often seen in part hanging out of the mouth. In this manner it digests by degrees; and in proportion as the part below is dissolved, the part above is taken in. It is not therefore till this tedious operation is entirely performed that the serpent renews its appetite and its activity. But, should any accident prevent it from issuing once more from its cell, it still can continue to bear famine for weeks, months, nay for years together. Vipers are often kept in boxes for six or eight months without any food whatever (see ABSTINENCE); and there are little serpents sometimes sent over to Europe from Grand Cairo that live for several years in glasses and never eat at all, nor even stain the glass with their excrements. 16. Other creatures have a choice in their provision; but the serpent indiscriminately preys upon all; the buffalo, the tiger, and the gazelle. One would think that the porcupine's quills might be sufficient to protect

it; but whatever has life serves to appease the hunger of these devouring creatures; porcupines, with all their quills, have often been found in their stomachs when killed and opened; nay, they even frequently devour each other. A life of savage hostility in the forest is a most tremendous scene. In those burning countries, where the sun dries up every brook for hundreds of miles round, a lake that is never dry, or a brook that is perennial, is considered by every animal as the greatest convenience of nature. When they discover one of these, no danger can deter them from attempting to slake their thirst. Thus it becomes the place where all the hostile tribes draw up for engagement. On the banks of this spot thousands of animals are seen venturing to quench their thirst, or preparing to seize their prey. The elephants, the buffaloes, the gazelles, rely upon their swiftness; the lion and tiger wait a proper opportunity to seize; but chiefly the larger serpents are upon guard, and defend the accesses of the lake. Not an hour passes without some dreadful combat; but the serpent, defended by its scales, and capable of sustaining a multitude of wounds, is of all others the most formidable.

In comparing serpents as to their voices, some are found silent, some have a peculiar cry; but hissing is the sound which they most commonly send forth, either as a call to their kind, or as a threat to their enemies. In the countries where they abound they are generally silent in the day, when they retire from the heat of the sun; but, as the cool of the evening approaches, they are heard issuing from their cells with continued hissings. As to motion, some serpents, particularly vipers, move slowly; while others dart with amazing swiftness. The motion in all is similar; but superior strength in some gives a different appearance. The viper, that is but a slow feeble-bodied animal, makes way in a heavy undulating manner; advancing its head, then drawing up its tail behind, and bending the body into a bow; then, from the spot where the head and tail were united, advancing the head forward as before. This, which is the motion of all serpents, is very different from that of the earth-worm. The serpent has a back-bone with numerous joints; and this bone the animal has the power of bending in every direction, but without being able to shorten or lengthen it at pleasure. The earth-worm has no back-bone; but its body is composed of rings, which, like a barber's puff, it can lengthen or shorten as it finds necessary. The earth-worm, therefore, to move forward, lengthens the body; then by the fore-part clings to the ground where it has reached, and contracts and brings up its rear: then the fore-part is lengthened again for another progression, and so on. The serpent, instead of shortening the body, bends it into an arch; and this is the principal difference between serpentine and vermicular progression. We have instanced this motion in the viper, as most easily discerned; but there are many serpents that dart with such amazing swiftness that they appear rather to leap than crawl. The manner of progression in the swiftest serpent we know, which is the jaculus, is by instantly coiling itself upon its tail, and darting thence to its

full extent: then, carrying the tail as quick as lightning to the head, coiling and darting again and thus proceeding with extreme rapidity without ever quitting the ground. Though all serpents are amphibious, some are much fonder of the water than others; and, though destitute of fins or gills, remain at the bottom, or swim along the surface, with great ease. From their internal structure we see how well adapted they are for either element: and how capable their blood is of circulating at the bottom as freely as in the frog or the tortoise. They can, however, endure to live in fresh water only; for salt is an effectual bane to the whole tribe. The greatest serpents are most usually found in fresh water where they find their prey in the greatest abundance. But that all will live and swim in liquids appears from an experiment of Rhedi, who put a serpent into a large glass vessel of wine, where it lived swimming about for six hours; though, when it was by force immersed and put under that liquid, it lived only one hour and a half. He put another in common water, where it lived three days; but, when it was kept under water, it lived only about twelve hours. Their motion there, however, is perfectly the reverse of what it is upon land; for, to support themselves upon an element lighter than their bodies, they are obliged to increase their surface in a very artificial manner. On earth their windings are perpendicular to the surface; in water they are parallel to it. Some serpents have a most horrible factor attending them. This proceeds from two glands near the vent, like those in the weasel or polecat; and, like those animals, in proportion as they are excited by rage or by fear, the scent grows stronger. Such serpents as are most venomous are least offensive in this particular: the rattle-snake and the viper have no smell whatever: nay, we are told that at Calcutt and Crangannon, in the East Indies, there are some very noxious serpents whose excrements are sought after and kept as perfumes. The Esculapian serpent is also of this number. Some serpents bring forth their young alive, as the viper; some bring forth eggs, which are hatched by the heat of their situation, as the common black snake, and the majority of the serpent tribe. The viper hatches her eggs, and brings them to maturity within her body; the snake is more premature in her productions, and sends her eggs into the light some time before the young ones are capable of leaving the shell. Thus, if either are opened, the eggs will be found in the womb, covered with their membranous shell, and adhering to each other like large beads on a string. In the eggs of both the young ones will be found, though at different stages of maturity: those of the viper will crawl and bite the moment the shell that encloses them is broke open: those of the snake are not yet arrived at their perfect form. Labat took a viper that was nine feet long, and ordered it to be opened in his presence. He then saw the manner in which the eggs of these animals lie in the womb. In this creature there were six eggs, each of the size of a goose's egg, but longer, more pointed, and covered with a membranous skin, by which also they were united to each other. Each of these eggs contained from their

een to fifteen young ones, about six inches long, and as thick as a goose-quill. Though the female, whence they were taken, was spotted, the young had a variety of colors very different from the parent. These little mischievous animals were no sooner let loose from the shell, than they crept about and put themselves into a threatening posture, coiling themselves up and biting the stick with which he was destroying them. In this manner he killed seventy-four young ones; those that were contained in one of the eggs escaped at the place where the female was killed, by the bursting of the egg and by getting among the bushes.

The *fascinating* power ascribed to serpents, especially to rattlesnakes, by which they are said to draw animals to them, is very curious. It has been described by so many different persons, who affirm that they have seen instances of it, and has been believed by so many men of penetration and discernment, that it deserves at least to be mentioned. The rattlesnake fixes its eyes upon an animal, such as a bird or a squirrel. When the animal spies the snake, it skips from spray to spray, hovering and approaching nearer the enemy; descending, with distracted gestures and cries, from the tops of the loftiest trees to the mouth of the snake, who opens his jaws, and in an instant swallows the unfortunate animal. The following instances of fascination have so much the appearance of fiction, that it would require a very uncommon degree of evidence to render them credible. They are extracted from a paper in the *Gentleman's Magazine* for 1765, p. 511, which was communicated by Mr. Peter Collinson from a correspondent in Philadelphia. 'A person of good credit was travelling by the side of a creek or small river, where he saw a ground squirrel running to and fro between the creek and a great tree a few yards distant; the squirrel's hair looked very rough, which showed he was scared, and, his returns being shorter and shorter, the man stood to observe the cause, and soon spied the head and neck of a rattlesnake pointing at the squirrel through a hole of the great tree, it being hollow; the squirrel at length gave over running, and laid himself quietly down with his head close to the snake's; the snake then opened his mouth wide, and took in the squirrel's head; upon which the man gave the snake a whip across the neck, and so the squirrel being released, he ran into the creek. When I was about thirteen years old, I lived with William Atkinson, an honest man in Bucks county, who, returning from a ride in warm weather, told us, that, while his horse was drinking at a run, he heard the cry of a blackbird, which he spied on the top of a sapling, fluttering and straining the way; he seemed unwilling to fly, and holding so fast the sprigs he was perched upon that the sapling top bent. After he had viewed the bird a few minutes, it quitted the place, and made a circle or two higher in the air, and then resumed its former standing, fluttering and crying. William thereupon rode the way the bird strained, and soon spied a large black snake in a coil, steadily eyeing the bird. He gave the snake a lash with his whip, and, this taking off the snake's eye from his prey, the charm was

broken, and away fled the bird, changing its note to a song of joy. Mr. Nicholas Scull, a surveyor, told me that when he was a young man, as he happened once to be leaning upon a fence, and looking over it, he saw a large snake in coil, looking stedfastly at him. He found himself surprised and listless immediately, and had no power for about a minute (as he thinks) but to look at the snake; and then he had the resolution to push himself from the fence, and turn away, feeling such horror and confusion as he would not undergo again for any consideration. Dr. Chew tells me, a man in Maryland was found fault with by his companion, that he did not come along; the companion, coming towards him, observed that his eyes were fixed upon a rattlesnake, which was gliding slowly towards him, with his head raised as if he was reaching up at him; the man was leaning towards the snake, and saying to himself, 'he will bite me! he will bite me!' Upon which his companion caught him by the shoulder, and pulled him about, and cried out, 'What the devil ails you! He will bite you sure enough!' This man found himself very sick after his enchantment.' This fascinating power of serpents was believed by Dr. Mead and other eminent men, who certainly thought they had sufficient evidence for admitting it. Incredible, therefore, as it appears, it ought not to be rejected without examination; though, being of a very extraordinary nature, it cannot be received without unquestionable evidence. Scepticism is no less absurd than incredulity, and the true philosopher will carefully avoid both. Human knowledge is founded on observation and experience; not, however, on every man's personal observation and experience, but on the united observation and experience of all mankind. But this presupposes the credibility of human testimony in every case that does not involve an impossibility. All the laws of nature are not yet known, nor all the wonderful powers of which she is possessed. It is not more incredible, *a priori*, that the eye of a serpent should attract an animal, than that a magnet should attract a piece of iron, or a piece of iron attract electrical matter. The evidence of these facts rests entirely on personal observation or authentic testimony. The only thing requisite with respect to objects of testimony is, when the fact is so extraordinary as has not fallen within the observation of the generality of men, the strength of the evidence must be in proportion to the extraordinary nature of the fact. To apply this to the present case: We have the testimony of many persons that some serpents have a power of fascination; but the generality of men have never observed this; it is therefore an extraordinary fact, and requires extraordinary evidence. But the evidence is not satisfactory; therefore we do not receive it as a fact; on the other hand, it is unphilosophical to reject it *a priori*.

We shall subjoin the prescription of Dr. Moseley, who spent twelve years in the West Indies, and whose abilities and extensive practice very justly entitle his opinion to the attention of the public, for the cure of the bite of serpents:—'The bites and stings of all venomous animals are cured by the same local means,

which are very simple, if they were always at hand. The injured part must be instantly destroyed or cut out. Destroying it is the most safe, and equally certain; and the best application for that purpose is the lapis infernalis, or the butter of antimony. These are preferable to a hot iron, which the ancients used; because a hot iron forms a crust, which acts as a defence to the under parts, instead of destroying them. The lapis infernalis is much better than any other caustic, as it melts and penetrates during its application. The bitten part must be destroyed to the bottom, and, where there is any doubt that the bottom of the wound is not sufficiently exposed, butter of antimony should be introduced into it on the following day, as deep as possible; and incisions should be made to lay every part open to the action of these applications. Besides destroying, burning, or cutting out the part, incisions should be made round the wound, to prevent the communication of the virus. The wound is to be dressed for some time with poultices, to assuage the inflammation caused by the caustics; and afterwards with acrid dressings and hot digestives to drain the injured parts. Where the above-mentioned caustics cannot be procured, corrosive sublimate, oil of vitriol, aquafortis, spirit of salt, common caustic, or a plaster made of quick lime and soap, may be applied to the wound. Gunpowder laid on the part, and fired has been used with success. When a person is bitten remote from any assistance, he should make a tight ligature about the part, until proper application can be made. The Spanish writers say, that the habilla de Carthagera, or Carthagera bean, is a specific for poisonous bites, taken inwardly. Ulloa says, it is 'one of the most effectual antidotes known in that country (Carthagera) against the bites of vipers and serpents; for a little of it being eaten, immediately after the bite, it presently stops the effect of the poison; and accordingly all who frequent the woods, either for felling trees or hunting, never fail to eat a little of this habilla fasting, and repair to their work without any apprehension. The natives tell you that, this habilla being hot in the highest degree, much of it cannot be eaten; that the common dose of it is less than the fourth part of a kernel; and that no hot liquor, as wine, brandy, &c., must be drunk immediately after taking it.' The Carthagera bean, or habilla, is found in great abundance in the West Indian Islands, where it is generally known by the name of antidote or cocoon, or antidote cocoon. In small doses it is stomachic and diaphoretic; and in large doses emetic and purgative. In several disorders it is a powerful remedy; but its virtues are not sufficiently known, except among the Indians and negroes, who chiefly use an infusion or tincture of it made in rum. This is externally as well as internally used for many complaints. This bean is the seed of the *fevillea foliis cordatis* of Plumier, Ed. Burmanni, p. 203, tab. 209. *Fevillea foliis cordatis*, angulatis, of Linnaeus, Spec. P.—I have been informed by some intelligent Indians, that any of the red peppers, such as bird pepper, or bell pepper, or what is called Cayenne pepper, powdered and taken in a glass of rum as much as the stomach can possibly bear, so as to cause,

and keep up for some time, a great heat and inflammation in the body and a vigorous circulation, will stop the progress of the poison of serpents, even after its effects are visible; and that the bitten part only afterwards mortifies and separates, and that the patient, with bark, wine, and cordials, soon recovers. This fiery practice is certainly agreeable to that of the ancients, and probably the only internal treatment that can have any good effect; as in these cases the powers of life, and the actions of the heart, are suddenly enfeebled, and the pulse in strength and frequency observes almost a regular declension from the time of the bite until it entirely ceases in death.' *Polygala senega*, or rattlesnake root, was formerly considered as a sovereign remedy for the bite of the rattlesnake; but this opinion is now exploded.

No subject has excited more philosophical controversy than the poison of serpents, with regard to its nature and mode of operating. Antiquity has not been sparing in conjecture and fiction upon this subject, and its errors have been retained with the most reverential obstinacy by the vulgar; among these we are to reckon the fictitious sting fixed in the tail of the serpent; a similar fiction of a black forked tongue which the serpent vibrates on both sides, while others, affecting an air of superior discernment, have ascribed the noxious effects to the teeth in general; these are all errors which a very little attention to the subject would have removed. There is a very small bone closely fixed to the upper jaw, in the inside of the lip of a poisonous serpent, which has a power of moving backwards or forwards; to this two or three fangs are annexed, larger than the teeth, which the serpent, by its assistance, when enraged, darts forward, or withdraws and conceals at his pleasure, in a similar manner to the claws of a cat. These fangs are excellently described by Tyson in the anatomy of the rattle snake, in the Philosophical Transactions. 'In these (the fangs) we observed a considerable cavity near the base; and near the point a very discernible fissure of some length like the slit of a pen: the part of the tooth from the fissure to the root was manifestly channelled, which we first discovered by lightly pressing the gums; we then saw the poison ascend through the cavity of the fang, and flow out of the fissure; and as these fangs are so very acute, so firm and solid toward the point (the fissure being on the external and convex, not the internal side), nothing could be conceived more convenient either for inflicting a wound, or to insure the infusion of the poison.' Each of the fangs is surrounded with a vesicle furnished with glands secreting a certain fluid; which, upon the vesicle being pressed, seems to flow out of the point of the fang. The serpent when incensed, raising his head, extends the small bone armed with the fangs mentioned above; and, attacking his enemy with a force combined of the weight of his body and the action of the muscles, he wounds him with the expanded fangs, and, the vesicle being compressed, the poison immediately flows into the wound; this is clear from the experience of those, who, having broken off their fangs with a

pair of forceps, handled the serpent thus disarmed without any hurt. The North Americans, after carefully extracting these venomous fangs, suffer the rattle-snake to bite and gnaw them with his teeth till the blood flows freely, with total impunity. Towards the end of the seventeenth century, this subject was greatly illustrated under the auspices of Ferdinand II., grand duke of Tuscany. This prince, desirous of enquiring into that mysterious question, the nature of serpents, invited Steno, Rhedi, and some other philosophers of the first eminence, to his court; and, a multitude of the most poisonous serpents being collected, Rhedi made several experiments upon them, which discovered to him a number of particulars before unknown; of which the following seem to have the best claim to our attention. When he either caused a living viper to bite a dog, or wounded him with the teeth of one newly dead (the poisonous vesicle remaining unbroken), the event was the same. If the bite was repeated, its effect became weaker, and at last was lost, the poison contained in the vesicle being totally exhausted. That the teeth of serpents, when extended to bite, were moistened over with a certain liquor; and, when the vesicle at the base was pressed, a drop of poison flowed to the point of the fang. When the poison thus flowing from the vesicle was received in soft bread, or a sponge, an animal bitten by the serpent received no more harm from the wound than from being pricked by a needle, till after a few days, when the venom was restored afresh; but, when an animal was wounded with a point of a needle dipped in the poison, it was tormented with the same pains as if it had been bitten by the viper itself. Preserving some of this poison in a glass, and totally evaporating the moisture in the sun, when the residuum was diluted again with water, and the point of a needle dipped in the solution, Rhedi found that it had the same effect as when recent. But the boldness of Tozzi, one who charmed vipers, flung all these men, who were deeply versed in natural philosophy, into the utmost astonishment. They happening to mention (while the prince was present) the certain death which would attend any person's swallowing this poison of the viper by mistake, Tozzi, confiding in his art, drank a considerable portion of it without hesitation; they were all astonished at his apparent rashness, and predicted instant death to him; but he was no more hurt than if he had drunk only so much water. This event, which astonished the prince and his illustrious associates, was well known to the ancients. Lucan, in the ninth book of the *Pharsalia*, speaking of the serpent says (*Phar. l. 9, v. 614*),

Mixed with the blood that venom slays alone,
His bite is poison; death is in his fang;
Yet is the draught innoxious.

Barbarous nations are perfectly acquainted with the property of the poison of serpents, by which it retains its deadly power after it has been long kept; they have been possessed of this fatal secret for ages; it being their custom to tinge the points of their arrows with the juice of spurge, putrid flesh, or oil of tobacco, but more particu-

larly with the poison of vipers. Some modern Indians continue the practice to this day; and we have the testimony of Pliny, in his *Natural History*, that the Scythians had long ago the same custom. 'The Scythians, says that author, dip their arrows in the poison of vipers and human blood; a horrid practice, as the slightest wound inflicted by one of them defies all the art of medicine.' The poison of serpents produces fatal effects only by mixing with the blood. To confirm this principle, the Florentine philosophers collected a quantity of poison and gave it to different animals without producing the least inconvenience; but, when applied to an external wound, every one of those horrid symptoms which accompany the real bite followed, viz.: inflammatory and malignant fevers, ending in death; unless nature, by a spontaneous hemorrhage, discharged this poison. With respect to the experiments of Rhedi, his observations prove that the liquid pressed out of the vesicle which moistens the fangs of the serpents is only noxious by being conveyed into the blood, by means of a puncture or wound; and the case of Tozzi proves that it hurts the blood only when externally mixed with it. The experiments of Rhedi have not, however, in the opinion of some celebrated philosophers, so far cleared the theory of the operation of the poison of the viper, as to leave nothing further to be desired upon that subject. Fontana and Carminati have endeavoured to investigate his operations more clearly. Carminati, from eleven experiments, deduces the following conclusions: 1. That if poison be instilled into a nerve the animal wounded dies almost instantly; and the whole nervous system, to which it is rapidly conveyed, is deprived of its quality called sensibility. 2. If a muscle be wounded, it is deprived of its irritability. This is confirmed by the experiments of Fontana. 3. The poison injected into a wounded muscle or tendon is considerably longer in killing an animal than that introduced into a nerve. 4. The symptoms which precede the death of the animal bitten are, stupor, lethargy, tremors, convulsions, paralysis of the legs (or part wounded) entire dissolution of the limbs. The blood is not always coagulated, nor its crasis dissolved. Marks of inflammation are sometimes discovered in certain parts of the animal after death, sometimes not. 5. Not the least sign of the jaundice was discoverable in the eyes of any of the animals upon which Carminati made his experiments. 6. The stomach in every one of them was very much inflated; a symptom remarked only by Fallopius and Albertini. 7. A ligature applied instantly above the part bitten, if it be so placed as to admit one, was found by some experiments a good preventative against the diffusion of the poison; its compression should be considerable but not excessive.

Characteristic marks have been pointed out by some writers to distinguish poisonous from harmless serpents (see *Philosophical Transactions*, vol. lxxix); but all of them that are drawn from the outside marks are quite ambiguous and uncertain; and those from the fangs, which afford the only decisive marks, cannot be per-

ceived at a distance. To those who form their ideas of the fangs of a venomous serpent from those of the rattle-snake, or even from those of the English viper, it will appear strange that there should be any difficulty in distinguishing those weapons in other serpents from common teeth; and indeed the distinction would be easy, were all venomous serpents furnished with fangs as large as those of that species. But the fact is, that in many species the fangs are full as small as common teeth, and consequently cannot, by their size, be known from them; this is the case with the coluber laticaudatus lacteus, and several others. Linnæus thought that the fangs might be distinguished by their mobility and situation; but other naturalists have not found it a general fact that fangs are loose in their sockets, nor have they observed any difference in situation between the fangs of venomous serpents and the teeth of others. The following distinction is established by Dr. Gray, in a paper inserted in the Philosophical Transactions, vol. lxxix.:—All venomous serpents have only two rows of teeth in the upper jaw, and all others have four. If this holds true it is certainly a most decisive mark; but still it requires too near, and of course too dangerous, an inspection.

In the preface to the Museum Regis, and in the introduction to the class amphibia, in the Systema Naturæ, Linnaeus says, that the proportion of venomous serpents is one in ten; yet in the Systema Naturæ, of which the sum total in species is 131, he has marked twenty-three as venomous, which is somewhat more than one in six. How he came to make such a variation it is not easy to say; but the last mentioned proportion seems to be near the truth, as Dr. Gray, after examining 154 species of serpents, found only twenty-six that seemed to be venomous. The coluber stolatus and mycterizans, though marked by Linnaeus, we are assured by Dr. Gray are not poisonous; he thinks the same may be said of the lebris and dyspas. On the other hand he observes, that the boa constrictor, coluber cerastes, laticaudatus, and coluber fulvus, none of which are marked in the Systema Naturæ, are all poisonous.

Under the article POISON we have mentioned a variety of chemical tests for discovering the presence of poison of the mineral kingdom. We shall now supply what has been omitted in that article, by describing the symptoms which accompany the bite of serpents. The symptoms attending the bite of the coluber prester, a native of Sweden, are, pain in the wound, tumor, thirst, asthma, anxieties, convulsions, and death. There is a serpent still more dreadful than any of the former, found in Sweden, called coluber carcia. The bite of this is followed by immediate change of color, coldness, stupor, palpitation of the heart, acute pain all over the body, and death. Linnæus tried oil in this case, but it proved ineffectual. The crotalus horridus of Linnaeus, the rattlesnake, kills in a very sudden manner; its bite usually producing death within twelve hours. The following account of the poison serpent of the East Indies is given by M. d'Obsonville:—‘Among the serpents of India that which I believe to be the

most formidable is but about two feet long, and very small. Its skin is freckled with little traits of brown or pale red, and contrasted with a ground of dirty yellow: it is mostly found in dry and rocky places, and its bite mortal in less than one or two minutes. In 1759, and in the province of Cadapet, I saw several instances of it; and among others one very singular, in the midst of a corps of troops commanded by M. de Bussy. An Indian Gentoo merchant perceived a Mahometan soldier of his acquaintance going to kill one of these reptiles, which he had found sleeping under his packet, the Gentoo flew to beg its life, protesting it would do no hurt if it was not first provoked: passing at the same time his hand under its belly to carry it out of the camp, when suddenly it twisted round, and bit his little finger; upon which this unfortunate martyr of a fanatic charity gave a shriek, took a few steps, and fell down insensible. They flew to his assistance, applied the serpent stone, fire, and scarification, but they were all ineffectual, his blood was already coagulated. About an hour after I saw the body as they were going to burn it, and I thought I perceived some indications of a complete dissolution of the blood. The serpents brulans, or burning serpent, is nearly of the same form with the last mentioned; its skin is not quite so deep a brown, and is speckled with dark green spots: its poison is almost as dangerous, but it is less active, and its effects are very different: in some persons it is a devouring fire, which, as it circulates through the veins, presently occasions death; the blood dissolves into a lymphatic liquor resembling thin broth, without apparently having passed through the intermediate state of coagulation, and runs from eyes, nose, and ears, and even through the pores. In other subjects the poison seems to have changed the very nature of the humors in dissolving them; the skin is chapped and becomes scaly, the hair falls off, the members are tumefied, the patient feels all over his body the most racking pains and numbness, and is not long in perishing. It is said, however, that people have been cured by remedies well and soon applied. Be this as it may, it seems to me that the poison of these different reptiles is in general more powerful the more they live in hot and dry places, where they feed upon insects that are full of saline, volatile, and acrimonious particles. We are ignorant of what species the hamorrhoids was, which is described by Lucan as causing by its bite a flux of blood from every part of the body. But the bite of an American serpent named de la cruz kills in the same manner. The dipsas is at present likewise unknown. Lucan informs us that the person wounded by it was attacked by unquenchable thirst. This is finely painted by him where A. Tuscus, standard-bearer of Cato, is described as bitten by that serpent: Pharsal. lib. 9. The phytas or amodytes of Linnaeus, or, according to others, the coluber aspis, seems to have been the serpent made use of by Cleopatra to destroy herself. This woman, to terminate a dissipated life with an easy death, ordered her physicians to prepare a poison for her which might best effect this purpose. Having tried a number of different experiments upon condemned

criminals, they at last discovered this species of asp, which brings on death without any previous appearance of distemper: the face seems in a slight perspiration, an easy insensibility and lethargy creeps upon the whole frame, and the person bitten seems almost totally ignorant of his approaching dissolution. Having acquainted the queen with their discovery, she applied the asp either to her bosom or her arms; or, according to some authors, dipping the point of a needle in the poison, and pricking herself with it, she expired in an easy sleep. The bite of the naja is so fatal that a man dies by it in the space of an hour, his flesh entirely falling off his bones in a semi-dissolved putrid state: this makes it probable that it is the same serpent which the ancients named the sepe.

The Psylli of old were famous for *charming* and destroying serpents. See PSYLLI. Some moderns pretend to the same art. Casaubon says that he knew a man who could at any time summon 100 serpents together, and draw them into the fire. Upon a certain occasion, when one of them, bigger than the rest, would not be brought in, he only repeated his charm, and it came forward like the rest, and submitted to the flames. Many other feats have been often practised upon these animals by artful men, who had first prepared the serpents for their exercise, and then exhibited them as adventitiously assembled at their call. In India there is nothing so common as dancing serpents, which are carried about in a broad flat vessel somewhat resembling a sieve. They erect and put themselves in motion at the word of command. When their keeper sings a slow tune they seem by their heads to keep time; when he sings a quicker measure they appear to move more brisk and lively. All animals have a certain degree of docility; and serpents can be brought to move at the voice of their master. From this trick, successfully practised before the ignorant, it is most probable have arisen most of the boasted pretensions which some have made to charming of serpents; an act to which the native Americans pretend at this very day, and which we are assured by Mr. Hasselquist exists amongst the native Egyptians.

If it be asked for what *purpose* were serpents created with such destructive weapons? we answer that they were given for self-defence. Without these, serpents, of all other animals, would be the most exposed and defenceless; without feet for escaping a pursuit, without teeth capable of inflicting a dangerous wound, or without strength for resistance; incapable from their size of finding security in very small retreats like the earthworm, and disgusting all from their deformity, nothing was left for them but a speedy extirpation. But, furnished as they are with powerful poison, every rank of animals approach them with dread, and never seize them but at an advantage. Nor is this all the benefit they derive from it. The malignity of a few serves for the protection of all. Though not above a tenth of their number are actually venomous, yet the similitude they all bear to each other excites a general terror of the whole tribe; and the uncertainty of their enemies about what serpents are poisonous, makes even the most harmless formidable. Thus

Providence seems to have acted with double precaution: it has given some of them poison for the general defence of a tribe naturally feeble; but it has thinned the numbers of those which are venomous, lest they should become too powerful for the rest of animated nature. From these noxious qualities in the serpent kind, it is no wonder that not only man, but beasts and birds, carry on an unceasing war against them. The ichneumon of the Indians, and the peccary of America, destroy them in great numbers. See SUS, and VIVERRA. These animals have the art of seizing them near the head; and it is said that they can skin them with great dexterity. The vulture and the eagle also prey upon them in great abundance; and often, sousing down from the clouds, drop upon a long serpent, which they snatch up struggling and writhing in the air. Dogs also are bred up to oppose them. Father Feuillée tells us that, being in the woods of Martinico, he was attacked by a large serpent, which he could not easily avoid, when his dog immediately came to his relief, and seized the assailant with great courage. The serpent entwined him, and pressed him so violently that the blood came out of his mouth, and yet the dog never ceased till he had torn it to pieces. The dog was not sensible of his wounds during the fight; but soon after his head swelled prodigiously, and he lay on the ground as dead. But his master having found a banana tree hard by, he applied its juice mixed with treacle to the wounds, which recovered the dog, and quickly healed his sores.

SERPENTS, WORSHIP OF. Though the generality of mankind regard this formidable race with horror, yet there have been some nations, and there are some at this day, that consider them with veneration and regard. The adoration paid by the ancient Egyptians to a serpent is well known: many of the nations at present along the western coast of Africa retain the same unaccountable veneration. Upon the Gold and Slave coasts, a stranger, entering the cottages of the natives, is often surprised to see the roof swarming with serpents, that cling there without molesting and unmolested by the natives. But his surprise will increase upon going farther southward to the kingdom of Whidah, where he finds that a serpent is the god of the country. This animal, which travellers describe as a huge overgrown creature, has its habitation, its temple, and its priests. These impress the vulgar with an opinion of its virtues; and numbers are daily seen to offer not only their goods, their provisions, and their prayers, at the shrine of their hideous deity, but also their wives and daughters. These the priests readily accept of, and after some days of penance return them to their suppliants, much benefited by the serpent's supposed embraces. The serpent, in ancient mythology, was a very common symbol of the sun, and he is represented biting his tail, and with his body formed into a circle, to indicate the ordinary course of this luminary, and under this form it was an emblem of time and eternity. The serpent was also the symbol of medicine, and of the gods which presided over it, as of Apollo and Æsculapius: and this animal was the object of very ancient and general worship, under various appellations

and characters. In most of the ancient rites we find some allusion to the serpent, under the several titles of Ob, Ops, Python, &c. This idolatry is alluded to by Moses, Lev. xx. 27. The woman of Endor who had a familiar spirit is called Oub, or Ob, and it is interpreted Pytho-nissa. The place where she resided, says the learned Mr. Bryant, seems to have been named from the worship then instituted: for Endor is compounded of En-ador, and signifies fons pytho-nis, 'the fountain of light,' the oracle of the god Ador; which oracle was probably founded by the Canaanites, and had never been totally suppressed. His pillar was also called Abbadir, or Abadir, compounded of ab and adir, and meaning the serpent deity Addir, the same as Adorus. In the orgies of Bacchus the persons who partook of the ceremony used to carry serpents in their hands, and with horrid screams call upon Eva! Eva! Eva being, according to Mr. Bryant, the same as epha, or opha, which the Greeks render ophis, and by it denoted a serpent. These ceremonies, and this symbolic worship, began among the Magi, who were the sons of Chus; and by them they were propagated in various parts. Wherever the Ammonians founded any places of worship, and introduced their rites, there was generally some story of a serpent. There was a legend about a serpent at Colchis, at Thebes, and at Delphi; and likewise in other places. The Greeks called Apollo himself Python, which is the same as Opis, Oupis, and Oub. In Egypt there was a serpent named Thermuthis, which was looked upon as very sacred; and the natives made use of it as a royal tiara, with which they ornamented the statues of Isis. The kings of Egypt wore high bonnets, terminating in a round ball, and surrounded with figures of asps; and the priests likewise had the representation of serpents upon their bonnets. Abaddon, or Abaddon, mentioned in the Revelations, xx. 2, is supposed by Mr. Bryant to have been the Ophite god, with whose worship the world had been so long infected. This worship began among the people of Chaldea, who built the city of Ophis upon the Tigris, and were greatly addicted to divination, and to the worship of the serpent. From Chaldea the worship passed into Egypt, where the serpent deity was called Canoph, Caneph, and C'neph. It had also the name of Ob or Oub, and was the same as the Basiliscus or royal serpent, the same as Thermuthis, and made use of by way of ornament to the statues of their gods. The same learned writer discovers traces of the serpent worship among the Hyperboreans, at Rhodes, named Ophiusa, in Phrygia, and upon the Hellespont, in the island Cyprus, in Crete, among the Athenians, in the name of Cecrops, among the natives of Thebes in Bœotia, among the Lacedæmonians, in Italy, in Syria, &c., and in the names of many places as well as of the people where the Ophites settled. One of the most early heresies introduced into the Christian church was that of the Ophites. See Bryant's *Analysis of Ancient Mythology*, vol. i. p. 43, &c.; p. 473, &c.

SERPENT, a musical instrument, serving as a bass to the cornet, or small shawn, to sustain a chorus of singers in a large edifice. It has its

name from its figure, as consisting of several folds or wreaths, which serve to reduce its length, which would otherwise be six or seven feet. It is usually covered with leather, and consists of three parts, a mouth-piece, a neck, and a tail. It has six holes, by means whereof it takes in the compass of two octaves. Mersennus, who has particularly described this instrument, mentions some peculiar properties of it, e. gr. that the sound of it is strong enough to drown twenty robust voices, being animated merely by the breath of a boy, and yet the sound of it may be attuned to the softness of the sweetest voice; and that, great as the distance between the third and fourth hole appears, yet, whether the third hole be open or snut, the difference is but a tone.

SERPENTARIUS, in astronomy, a constellation of the northern hemisphere, called also Ophiuchus, and anciently Æsculapius. See ASTRONOMY.

SERPENTINE, in the manege. A horse is said to have a serpentine tongue, if it is always frisking and moving, and sometimes passing over the bit, instead of keeping in the void space called the liberty of the tongue.

SERPENTINE STONE, in the old system of mineralogy, a genus of magnesian earths, of which mineralogists enumerated four different species; 1. The fibrosus, composed of fibrous and coherent particles. This resembles the asbestos so much that it might be confounded with it, were not the fibres of the serpentine so closely coherent, that they cannot be distinguished when the stone is cut or polished. The fibres are large, and seem twisted. There are two varieties, a dark green and light one; the former from Germany, the latter from Sweden. 2. The Zoëblitz serpentine, found near that place, of many different colors, as black, deep green, light green, red, bluish-gray, and white; but the green is most predominant. 3. 'Porcelain earth, mixed with iron, is met with either diffusible in water or indurated. The former is of a red color, from China and Montmartre. There are two varieties of the indurated kind, viz. the martial soap-earth, of a red color, from Jasberg and other places in Norway, or black from some parts of Sweden. 4. The telgston of Sweden, the same with the lapis ollaris. It is found in various places of Norway, as light and dark gray, whitish yellow, and dark green. It is employed with great advantage for building fire-places, furnaces, &c., the extremities of the strata being turned towards the fire when it is slaty. M. Magellan says, the texture of serpentine is either indistinct, obscurely laminar, or fibrous. It is harder than steatites, though not hard enough to strike fire with steel; being less smooth to the touch, but susceptible of a good polish, looking like marble; and is often met with in thin semitransparent plates. It melts in a strong heat without addition, and corrodes the crucibles, but hardens in a lower degree of heat. It is slowly and partially soluble in acids, but does not effervesce with them; has its name from being variegated with green, yellowish, and brown spots, like the skin of some serpents; great quantities of it are found in Italy and Switzerland, where it is frequently worked into dishes, &c.

SERPENTINE VERSES are such as begin and end with the same word : as,

Ambo florentes ætatibus, Arcades ambo :

Or such as begin in one half of the line, and end in the other, with precisely the same letters, so that they may be read either from right to left like the Hebrew, or from left to right ; as,

Otto tenet mappam, inadidam mappam tenet Otto.

SERPENTINE WORM, the worm or pipe of a still, twisted in a spiral manner.

SERPICULA, in botany, a genus of the monœcia class and tetrandria order of plants : MALE CAL. quadridentate : COR. consists of four petals : FEMALE CAL. divided into four parts, and the pericarpium is a tomentose nut. There are two species, the verticillata and repens.

SERPIGO, *n. s.* Lat. *serpigo*. A kind of tetter.

For thy own bowels, which do call thee sire,
Do curse the gout, *serpigo*, and the rheum,
For ending thee no sooner. *Shakspeare.*

She had a node, with pains, on her right leg, and a *serpigo* on her right hand. *Wiseman.*

The skin behind her ear downwards became *serpiginous*, and was covered with white scales. *Id.*

SERPIGO, in surgery, is a kind of herpes, popularly called a tetter, or ringworm. See SURGERY.

SERPULA, in zoology, a genus belonging to the class of vermes, and to the order of testacea. The shell is single, tubular, and adhering to other bodies. The animal which inhabits it is the terebella.

SERR, *v. a.* Fr. *serrer*. To drive hard together ; crowd into a little space. Disused.

The frowning and knitting of the brows is a gathering or *serring* of the spirits, to resist in some measure ; and also this knitting will follow upon earnest studying, though it be without dislike.

Bacon's Natural History.

With them rose

A forest huge of spears, and thronging helms
Appeared, and *serr'd* shields in thick array,
Of death immeasurable. *Milton's Paradise Lost.*

SERRANUS, a surname given to Cincinnatus, because he was found sowing his fields, when the deputation from the senate came to inform him that he was elected dictator.

SERRANUS, a Latin poet of considerable merit, who flourished under Domitian. Juv. vii. v. 80.

SERRANUS (Joannes, or John de Serres), a learned French Protestant, born in 1548. He acquired the Greek and Latin languages at Lausanne, and grew very fond of the philosophy of Aristotle and Plato. On his return to France he studied divinity. He began to distinguish himself in 1572 by his writings, but was obliged to forsake his country after the dreadful massacre of St. Bartholomew. He became minister of Nismes in 1582, but was never regarded as a very zealous Calvinist. He was one of the four clergymen whom Henry IV. consulted about the Romish religion, and who returned for answer that Catholics might be saved. He wrote afterwards a treatise to reconcile the two communions, entitled *De fide Catholica, sive de principiis religionis Christianæ, communi omnium Christianorum consensu, semper et ubique ratis*. This

work was disliked by the Catholics, and received with such indignation by the Calvinists of Geneva that many writers affirm they poisoned the author. It is certain that he died at Geneva in 1598, aged fifty ; and, his wife also dying suddenly along with him, it was suspected that both were poisoned. His principal works are, 1. A Latin translation of Plato, published by Henry Stephens, which owes much of its reputation to the elegance of the Greek copy which accompanies it. 2. A Treatise on the Immortality of the Soul. 3. De Statu religionis et reipublicæ in Francia. 4. Memoire de la 3^e me guerre civile et derniers troubles de France sous Charles IX., &c. 5. Inventaire general de l'Histoire de France, illustre par la conference de l'Eglise et de l'Empire, &c. 6. Recueil de choses memorables avenues en France sous Henri II., François II., Charles IX., Henri III. These three historical treatises have been justly accused of partiality and passion ; faults which it is next to impossible for a contemporary writer to avoid, especially if he bore any part in the transactions which he describes. His style is exceedingly incorrect and inelegant ; his mistakes too and misstatements of facts are very numerous.

SERRATE, *adj.* } Lat. *serratus*. Formed
SER'ATED, } with jags or indentures
SER'ATURE. } like the edge of a saw :
serrature is indenture of this kind.

All that have *serrate* teeth are carnivorous. *Ray.*

This stick is usually knotted and always armed : one of them with a curious shark's tooth near an inch long, and indented or *serrated* on both edges : a scurvy weapon. *Grew.*

These are *serrated* on the edges ; but the *serratures* are deeper and grosser than in any of the rest.

Woodward.

The common heron hath long legs for wading, a long neck answerable thereto to reach prey, a wide throat to pouch it, and long toes, with strong hooked talons, one of which is remarkably *serrate* on the edge. *Derham's Physico-Theology.*

SERRATED, is a term much used in the description of the leaves of plants. See BOTANY.

SERRATULA, saw-wort, in botany, a genus of the syngenesia class, and polygamia æqualis order of plants ; natural order forty-ninth, compositæ : CAL. subcylindrical, imbricated ; the scales of it pointed, but not spinous. There are fifteen species : viz. 1. Alpina ; 2. amara ; 3. arvensis ; 4. centauroides ; 5. coronata ; 6. glauca ; 7. Japonica ; 8. multiflora ; 9. Nove bora-censis ; 10. paralta ; 11. salicifolia ; 12. scariosa ; 13. spicata ; 14. squarrosa ; and, 15. tinctoria. Of these three are British : viz. 1. S. alpina, mountain saw-wort. The root and stem are woody ; the latter being from one to two feet high. The leaves are numerous, triangular, long pointed, substantial, dark green above, white beneath, and serrated, with round intervals between the teeth, on foot-stalks. The flowers are purple. The scales of the calyx are very short and downy. It grows on high mountains, and flowers commonly in July or August. 2. S. arvensis, corn saw-wort, or way thistle. The stem is generally erect, branched, and two or three feet high. The leaves are sinuated, ser-

rated and spinous; those above being almost entire. The flowers are of a pale purple; the down is very long. This plant grows in cultivated grounds and by waysides, and flowers in July or August. When burned it yields good ashes for making glass or fixed alkali. 3. *S. tinctoria* is distinguished by a stem erect and slender, branched at the top, and three feet high. The leaves are smooth, pinnatifid, and serrated: the flowers are purple, and in umbels, and terminal. The down of the seed is glossy, with a brown or gold tinge. It grows in woods and wet pastures. It dyes cloth of an exceedingly fine yellow color, which stands well when fixed with alum. Goats eat this plant; horses are not fond of it; cattle, swine, and sheep, leave it untouched.

SERRATUS, in anatomy, a name given to several muscles, from their resemblance to a saw. See **ANATOMY**.

SERRES (John Thomas), a French artist of considerable merit and reputation in sea pieces. He was descended of a noble family, long resident at Beaupierre, near Ocher, whence his father, count Dominic de Serres, nephew of the then archbishop of Rheims, eloped, in order to avoid an ecclesiastical life. Entering the Spanish service, he was taken prisoner by the English, received his liberty on parole, and, though afterwards this restriction was removed, he continued to reside in this country, and to exercise his talents as a draughtsman, which at length procured him the honor of a seat among the fellows of the Royal Academy. His eldest son, the subject of this article, inherited his father's genius, and, besides the many proofs of his talents as a painter yet extant, was the author of a work entitled the *Little Sea Torch, a Guide for Coasting Pilots*, folio, 1801. Mr. Serres was husband to the so-disant princess Olive of Cumberland. He died December 28th, 1825.

SERRES (Oliver), a French agriculturalist, was born in 1539, at Villeneuve de Bery, near Viviers, and showed himself so able a manager of his own estate, that Henry IV. called him to Paris, and entrusted him with the management of the royal domains. He had the merit of introducing the white mulberry into France, and was the author of many valuable improvements. He died in 1619. The works of this respectable individual are, a *Treatise on the Culture of Silk*, 1599; *Feconde Richesse du Meurier Blanc*, 1603; *Theatre d'Agriculture et Menage des Champs*; which last work has been repeatedly printed, and is much esteemed.

SERT, a town of Kurdistan, Asiatic Turkey, the ancient Tigranocerta, the capital of Tigranes, who peopled it chiefly by the prisoners seized during his invasion of Syria and Cappadocia, A. C. 69. It was taken and plundered by Lucullus, but retained its importance till after the Saracen invasion. It is now only a large village, containing about 3000 inhabitants, Mahometans and Armenian Christians, who have three small mosques, a college, and Armenian church. It is surrounded on every side by high mountains, and washed by the Kabour. The surrounding territory is in an improved state of culture: and the chief of this place is a powerful

feudal lord. Seventy-five miles south-east of Diarbekir.

SERTIO (Sebastian), a celebrated architect and writer, born at Bologna, in the sixteenth century. On the invitation of Francis II. he embellished his palace at Fontainebleau. He wrote a *Treatise on Architecture*, which does honor to his judgment and taste.

SERTORIUS (Quintus), a celebrated Roman general, born at Nursia. He accompanied Marius into Gaul, and fought bravely against the Teutones and Cimbri, but lost an eye in the first battle. He followed Marius and Cinna to Rome, but disapproved of the cruelties committed by these monsters. Being afterwards proscribed by the equally bloody Sylla, he fled into Spain, where he headed the other proscribed exiles, and acted with such valor and address that he became for a time sovereign of the country. See **ROME** and **SPAIN**. While Rome itself was subjected to repeated bloody massacres, and all law and justice seemed to be abolished, Sertorius erected a republic in Spain, and governed the people with so much justice, mildness, and humanity, that the Lusitanians almost adored him. But a villain named Perpenna, envious of his fame, conspired with one Antonius, and murdered him at a banquet, A. C. 73.

SERTULARIA, in zoology, a genus belonging to the class of vermes, and to the order of zoophyta. The stem is radicated, fibrous, naked, and jointed; the florets are hydræ, and there is one at each joint. This genus comprehends forty-two species of corallines.

SERVAL, the mountain cat. See **FELIS**.

SERVAN (St.), a town of the north department of the Ile and Vilaine, France, situated at the mouth of the Rance, about a mile to the south of St. Malo. It is tolerably built, has a fine port, divided into two parts by a rock, on which stands the tower of Solidor, and manufactures of linen, sail cloth, soap, and tobacco; ship-building is likewise carried on to some extent. One of the divisions of the port is fitted for men of war or large merchantmen; the other for smaller vessels. This place is the resort of a number of English families: and in time of war sends out numerous privateers.

SERVANDONI (John Nicholas), an eminent architect, born at Florence in 1695. He rendered himself famous by his exquisite taste in architecture, and by his genius for decorations, fetes, and buildings. He was employed and rewarded by most of the princes in Europe. He was honored in Portugal with the order of Christ. In France he was architect and painter to the king, and member of the different academies established for the advancement of these arts. He received the same titles from the kings of Britain, Spain, and Poland, and from the duke of Wirtemberg. With all these advantages, his want of economy was so great, that he left nothing behind him. He made decorations for the theatres of Paris, London, and Dresden. The French king's theatre, called la salle des Machines, was under his management. His shows and decorations were astonishingly sublime; his *Déscent of Æneas into Hell* in particular, and his *Enchanted Forest*. He built a theatre at Chambord for count Saxe; and fur-

nished the plan of the theatre royal at Dresden. His genius for fêtes was remarkable; he conducted a great number in Paris and London; and one at Lisbon for a victory gained by the duke of Cumberland. He presided at the magnificent fête given at Vienna on the marriage of the archduke Joseph and the infanta of Parma. He died at Paris in 1766.

SERVANT, <i>n. s. & v. a.</i>	} Fr. <i>server</i> ; Lat. <i>servio</i> . To attend; work for; obey; assist; promote; help; satisfy; stand instead of any thing to another; treat; discharge, as an office;
SERVE, <i>v. a. & v. n.</i>	
SERVICE, <i>n. s.</i>	
SERVICEABLE, <i>adj.</i>	
SERVICEABLY, <i>adv.</i>	
SERVICEABLENESS, <i>n. s.</i>	
SERVING-MAN, <i>n. s.</i>	
SERVITUDE.	

and (a Gallicism) to make use of, as in the phrase (Fr. *se servir de*) to serve himself of: as a verb neuter, to be in attendance; be a servant or slave; wait; be convenient; produce a desired end; suit; conduce; officiate: a servant is he who in any way serves, obeys, or attends; one in a state of subjection; one in menial employ: used by Shakspeare as a verb active for to subject: service, such employ, or any occupation or duty of a servant; military duty; purpose; use; useful office; course; order: the adverb and noun substantive corresponding: a serving-man is a menial servant: servitude, the state of a servant, particularly of a menial one.

And we distrien counsells and al highnesse that higheth itself aghens the science of God and dryuen into caitifte al understandyng into the *seruyce* of Crist. *Wiclif. 2 Cor. 10.*

We will give thee this also for the *service* which thou shalt *serve* with me. *Genesis xx. 27.*

Thou hast made me to *serve* with thy sins; thou hast wearied me with thine iniquities. *Isaiah xliii. 24.*

They that *serve* the city shall *serve* it out of all the tribes of Israel. *Ezek. xlviii. 19.*

Israel *served* for a wife, and for a wife he kept sheep. *Hosea.*

Martha was cumbered about much *servicing*, and said, Lord, dost thou not care that my sister hath left me to *serve* alone? *Luke x. 40.*

The look bewrayed, that, as she used these ornaments not for herself, but to prevail with another, so she feared that all would not *serve*. *Sidney.*

He was sent to the king's court, with letters from that officer, containing his own *serviceable* diligence in discovering so great a personage; adding withal more than was true of his conjectures. *Id.*

He might continually be in her presence, shewing more humble *serviceableness* and joy to content her than ever before. *Id.*

When he cometh to experience of *service* abroad, or is put to a piece or pike, he maketh a worthy soldier. *Spenser.*

They think herein we *serve* the time because thereby we either hold or seek preferment. *Hooker.*

Our speech to worldly superiors we frame in such sort as *serveth* best to inform and persuade the minds of them, who otherwise neither could nor would greatly regard our necessities. *Id.*

According to this form of theirs, it must stand for a rule, No sermon, no *service*. *Id.*

Religion hath force to qualify all sorts of men and to make them, in public affairs, the more *serviceable*; governors the apter to rule with conscience; inferiors, for conscience sake, the willing to obey. *Id.*

Aristotle speaketh of men whom nature hath framed for the state of *servitude*, saying, They have reason so far forth as to conceive when others direct them. *Id.*

Many noble gentlen-en came out of all parts of Italy, who had before been great commanders, but now *served* as private gentlemen without pay.

Knolles's History of the Turks.

Bid them cover the table, *serve* in the meat, And we will come in to dinner.

Id. Merchant of Venice.

Both more or less have given him the revolt;

And none *serve* with him but constrained things,

Whose hearts are absent too. *Shakspeare. Macbeth.*

As occasion *serves* this noble queen

And prince shall follow with a fresh supply.

Id. Henry IV.

Being unprepared,
Our will became the *servant* to defect,
Which else should free have wronged.

Id. Macbeth.

My affairs

Are *servanted* to others: though I owe

My revenge properly, remission lies

In Volscean breasts. *Id. Coriolanus.*

The banish'd Kent, who in disguise

Follow'd his king, and did him *service*

Improper for a slave. *Id. King Lear.*

To thee a woman's *services* are due,
My fool usurps my body. *Id.*

I know thee well, a *serviceable* villain;

As duteous to the vices of thy mistress

As badness could desire. *Id.*

Thou, Nature, art my goddess; to thy law

My *services* are bound. *Id.*

Both fell by our *servants*, by those men we lov'd most:

A most unnatural and faithless *service*. *Shakspeare.*

By oppressing and betraying me,

Thou might'st have sooner got another *service*. *Id.*

That *service* is not *service*, so being done,

But being so allowed. *Id. Cymbeline.*

I am a woman lacking wit

To make a seemly answer to such persons

Pray do my *service* to his majesty. *Id. Henry VIII.*

Your niece did more favours to the duke's *servant*-man, than ever she bestowed on me.

Id. Twelfth Night.

You would have sold your king to slaughter,

His princes and his peers to *servitude*,

His subjects to oppression and contempt.

Id. Henry V.

Soon after our dinner was *served in*, which was right good viands, both for bread and meat: we had also drink of three sorts, all wholesome and good.

Bacon.

Riches gotten by *service*, though it be of the best rise, yet, when gotten by flattery, may be placed amongst the worst. *Id.*

Although they built castles, and made freeholders, yet were there no tenures and *services* reserved to the crown; but the lords drew all the respect and dependency of the common people unto themselves.

Davies's State of Ireland.

At the parliament at Oxford, his youth, and want of experience in sea-*service*, had somewhat been shrewdly touch'd, even before the sluices of popular liberty were yet set open. *Wotton's Buck.*

Just in the nick; the cook knock'd thrice,

And all the waiters in a trice

His summons did obey;

Each *servant-man*, with dish in hand,

Marched boldly up, like our train'd band,

Presented, and away. *Suckling*

All the vessels of the king's house are not for
uses of honour; some be common stuff, and for
mean services, yet profitable. *Spelman.*

I will serve myself of this concession.
Chillingworth.

I know no necessity why private and single abilities should quite jumble out and deprive the church of the joint abilities and concurrent gifts of many learned and godly men, such as the composers of the service book were. *King Charles.*

Cleopatra made Antony a supper sumptuous and royal; howbeit there was no extraordinary service seen on the board. *Hakewill.*

A complete brave man must know solidly the main end he is in the world for: and withal how to serve himself of the divine's high contemplations, of the metaphysician's subtle speculations, and of the natural philosopher's minute observations.

Digby on the Soul.

They would serve themselves of this form. *Taylor.*

Besmeared with the horrid juice of scpia, they danced a little in phantastick postures, retired awhile, and then returned, serving up a banquet as at solemn funerals. *Id.*

When a storm of a sad mischance beats upon our spirits, turn it into some advantage, by observing where it can serve another end, either of religion or prudence. *Id.*

*When wealthy, shew thy wisdom not to be
To wealth a servant, but make wealth serve thee.* *Denham.*

*A goddess among gods ador'd, and served
By angels numberless, thy daily train.* *Milton.*

*Bodies bright and greater should not serve
The less not bright.* *Id.*

Matters hid leave to God, him serve and fear. *Id.*

*Who lessens thee, against his purpose serves
To manifest the more thy might.* *Id.*

*After him a cumb'rous train
Of herds, and flocks, and numerous servitude.* *Id.*

It is much more easy for men to serve their own ends of those principles, which they do not put into men, but find there. *Tillotson.*

God requires no man's service upon hard and unreasonable terms. *Id. Sermons.*

A court, properly a fair, the end of it trade and gain: for none would go to service that thinks he has enough to live well of himself. *Temple.*

*Others, pampered in their shameless pride,
Are served in plate, and in their chariots ride.* *Dryden.*

If they elevate themselves, 'tis only to fall from a higher place, because they serve themselves of other men's wings, neither understanding their use nor virtue. *Id. Dufresnoy.*

*Take it, she said: and, when your needs require,
This little brand will serve to light your fire.* *Dryden.*

*Read that; 'tis with the royal signet signed,
And given me by the king, when time should serve,
To be perused by you.* *Id. Spanish Fryar.*

This poem was the last piece of service I did for my master king Charles. *Dryden.*

Nothing would serve them but riding. *L' Estrange.*

The stork's plea, when taken in a net, was the service she did in picking up venomous creatures. *Id.*

If any subject, interest, or fancy has recommended, their reasoning is after their fashion; it serves their turn. *Locke.*

All action being for some end, its aptness to be commanded or forbidden must be founded upon its serviceableness or disserviceableness to some end. *Norris.*

*Shall he thus serve his country, and the muse
The tribute of her just applause refuse?* *Tate.*

*As the former empty plea served the sottish Jews,
this equally serves these to put them into a fool's paradise, by feeding their hopes, without changing their lives.* *Smith.*

Though it is necessary that some persons in the world should be in love with a splendid servitude, yet certainly they must be much beholding to their own fancy, that they can be pleased at it; for he that rises up early, and goes to bed late, only to receive addresses, is really as much abridged in his freedom, as he that waits to present one. *Id.*

The order of human society cannot be preserved, nor the services requisite to the support of it be supplied, without a distinction of stations, and a long subordination of offices. *Rogers.*

His own inclinations were to confine himself to his own business, and be serviceable to religion and learning. *Atterbury.*

The same mess should be served up again for supper, and breakfast next morning.

Arbuthnot's History of John Bull.

*One half-pint bottle serves them both to dine,
And is at once their vinegar and wine.* *Pope.*

Gentle streams visit populous towns in their course, and are at once of ornament and service to them. *Id.*

Our victory only served to lead us on to further visionary prospects. *Swift.*

If stations of power and trust were constantly made the rewards of virtue, men of great abilities would endeavour to excel in the duties of a religious life, in order to qualify themselves for public service. *Id.*

The clergy prevent themselves from doing much service to religion, by affecting so much to converse with each other, and caring so little to mingle with the laity. *Id.*

A book to justify the revolution archbishop Tillotson recommended to the king, as the most serviceable treatise that could have been published then. *Id.*

With Dennis you did ne'er combine,

Not you, to steal your master's wine;

Except a bottle, now and then,

To welcome brother serving-men. *Id.*

That service may really be done, the medicine must be given in larger quantities. *Mead.*

The congregation was discomposed, and divine service broken off. *Watts.*

If my name, therefore, will serve them in any degree, as a pass-port into the public notice, they are welcome to it. *Cowper's Private Correspondence.*

SERVANT is a term of relation signifying a person who owes and pays obedience for a certain time to another in quality of a master. The law of England therefore abhors, and will not endure, the existence of slavery within this nation: so that when an attempt was made to introduce it by stat. 1 Edw. VI. c. 3, which ordained that all idle vagabonds should be made slaves, and fed upon bread, water, or small drink, and refuse meat; should wear a ring of iron round their necks, arms, or legs; and should be compelled, by beating, chaining, or otherwise, to perform the work assigned them, were it ever so vile; the spirit of the nation could not brook this condition, even in the most abandoned rogues; and therefore this statute was repealed two years afterwards. And now it is laid down that a slave or negro, the instant he lands in Britain, becomes a freeman; that is, the law will protect him in the enjoyment of his person and his pro-

perty. Hence, too, it follows, that the infamous and unchristian practice of withholding baptism from negro servants, lest they should thereby gain their liberty, is totally without foundation, as well as without excuse. The law of England acts upon general and extensive principles; it gives liberty and protection to a Jew, a Turk, or a Heathen, as well as to those who profess the true religion of Christ; and it will not dissolve a civil obligation between master and servant, on account of the alteration of faith in either of the parties; but the slave is entitled to the same protection in England before as after baptism; and, whatever service the Heathen negro owed of right to his American master, by general, not by local law, the same (whatever it be) is he bound to render when brought to England and made a Christian. 1. The first sort of servants, therefore, acknowledged by the laws of England, are menial servants; so called from being *intra mœnia*, i. e. between the walls, or domestics. The contract between them and their masters arises upon the hiring. If the hiring be general, without any particular time limited, the law construes it to be a hiring for a year; upon a principle of natural equity, that the servant shall serve, and the master maintain him, throughout all the revolutions of the respective seasons; as well when there is work to be done, as when there is not; but the contract may be made for any larger or smaller term. All single men between twelve years old and sixty, and married ones under thirty years of age, and all single women between twelve and forty, not having any visible livelihood, are compellable by two justices to go out to service in husbandry or certain specific trades, for the promotion of honest industry; and no master can put away his servant, or servant leave his master, after being so retained, either before or at the end of his term, without a quarter's warning; unless upon reasonable cause, to be allowed by a justice of the peace: but they may part by consent, or make a special bargain. 2. Another species of servants are called apprentices (from *apprendre*, to learn), and are usually bound for a term of years. See APPRENTICE and APPRENTICESHIP. 3. A third species of servants are laborers, who are only hired by the day, or the week, and do not live *intra mœnia*, as part of the family, concerning whom the statutes before cited have made many very good regulations: 1. Directing that all persons who have no visible effects may be compelled to work; 2. Defining how long they must continue at work in summer and in winter: 3. Punishing such as leave or desert their work: 4. Empowering the justices at sessions, or the sheriff of the county, to settle their wages: and, 5. Inflicting penalties on such as either give or exact more wages than are so settled. There is yet a fourth species of servants, if they may be so called, being rather in a superior, a ministerial, capacity; such as stewards, factors, and bailiffs; whom, however, the law considers as servants *pro tempore*, with regard to such of their acts as affect their master's or employer's property. As to the manner in which this relation affects the master, the servant himself, or third parties, see MASTER.

SERVETUS (Michael), M. D., a learned Spanish physician, born at Villaneuva, in Arragon, in 1509. He studied the civil law at the university of Toulouse. The Reformation, which had awakened the most polished nations of Europe, directed the attention of thinking men to the errors of the Romish church, and to the study of the Scriptures. Servetus, from the love of novelty, or of truth, carried his enquiries far beyond the other reformers, and not only renounced the false opinions of the Roman Catholics, but went so far as to question the doctrine of the Trinity. Accordingly, after spending several years at Toulouse, he went into Germany to propagate his new opinions. At Basil he had some conferences with Oecolampadius. He went next to Strasburg to visit Bucer and Capito, two eminent reformers of that town. From Strasburg he went to Hagenau, where he printed a book, entitled *De Trinitatis Erroribus*, in 1531. In 1532 he published two other treatises on the same subject; in an advertisement to which he informs the reader that it was not his intention to retract any of his former sentiments, but only to state them in a more distinct and accurate manner. To these two publications he had the courage to put his name, not suspecting that, in an age when liberty of opinion was granted, the exercise of that liberty would be attended with danger. After publishing these books, he left Germany, probably finding his doctrines not so cordially received as he expected. He went first to Basil, and thence to Lyons, where he lived two or three years. He then removed to Paris, where he studied medicine under Sylvius, Fernellius, and other professors, and obtained the degrees of M. A. and M. D. His love of controversy involved him in a serious dispute with the physicians of Paris; and he wrote an apology, which was suppressed by an edict of the parliament. The misunderstanding which this dispute produced with his colleagues, and the chagrin which so unfavorable a termination occasioned, made him leave Paris in disgust. He settled two or three years in Lyons, and engaged with the Frellons, eminent printers of that age, as a corrector of their press. At Lyons he met with Peter Palmier, the archbishop of Vienne, with whom he had been acquainted at Paris. That prelate, who was a great encourager of learned men, pressed him to accompany him to Vienne, offering him at the same time an apartment in his palace. Servetus accepted the offer, and might have lived a tranquil and happy life at Vienne, if he could have confined his attention to medicine and literature. But an eagerness to establish his opinions always possessed him. At this time Calvin was at the head of the reformed church at Geneva. With Servetus he had been acquainted at Paris, and had there opposed his opinions. For sixteen years Calvin kept up a correspondence with him, endeavouring to reclaim him from his errors. Servetus had read the works of Calvin, but did not think they merited the high eulogies bestowed on them, nor did they convince him of his errors. He continued, however, to consult him; and for this purpose sent from Lyons to Geneva three questions, which respected the divinity of Jesus

Christ, regeneration, and the necessity of baptism. To these Calvin returned a civil answer. Servetus treated the answer with contempt, and Calvin replied with warmth. From reasoning he had recourse to abusive language; and this produced a polemical hatred, the most implacable disposition in the world. Calvin, having obtained some of Servetus's papers, sent them to Vienne along with the private letters which he had received during their correspondence. The consequence was that Servetus was arrested; but, having escaped from prison, he resolved to retire to Naples, where he hoped to practise medicine with the same reputation which he had so long enjoyed at Vienne. He imprudently took his route through Geneva. Calvin informed the magistrates of his arrival; Servetus was apprehended, and appointed to stand trial for heresy and blasphemy. It was a law at Geneva that every accuser should surrender himself a prisoner, that, if the charge should be found false, the accuser should suffer the punishment in which he meant to involve the accused. Calvin, not choosing to go to prison himself, sent one of his domestics to present the impeachment against Servetus. The articles brought against him were collected from his writings with great care; an employment which took up three days. One of these articles was, 'that Servetus had denied that Judea was a beautiful, rich, and fertile country; and affirmed, on the authority of travellers, that it was poor, barren, and disagreeable.' He was also charged with 'corrupting the Latin Bible, which he was employed to correct at Lyons, by introducing impertinent, trifling, whimsical, and impious notes of his own through every page.' But the main article, which was certainly fatal to him, was, 'that in the person of Mr. Calvin, minister of the word of God in the church of Geneva, he had defamed the doctrine that is preached, uttering all imaginable injurious blasphemous words against it.' Calvin visited Servetus in prison, and had frequent conferences with him; but finding that, in opposition to all the arguments he could employ, the prisoner remained inflexible in his opinions, he left him to his fate. Before sentence was passed, the magistrates of Geneva consulted the ministers of Bale, of Berne, and Zurich; and, as another account informs us, the magistrates of the protestant cantons of Switzerland. And, to enable them to form a judgment of the criminality of Servetus, they transmitted the writings of Calvin, with his answers. The general opinion was that Servetus ought to be condemned to death for blasphemy. He was accordingly sentenced to be burnt alive on the 27th of October, 1553. As he continued alive in the midst of the flames more than two hours, it is said, finding his torment thus protracted, he exclaimed: 'Unhappy wretch that I am! Will the flames be insufficient to terminate my misery! What then! Will the 100 pieces of gold, and the rich collar which they took from me, not purchase wood enough to consume me more quickly!' Though the sentence of death was passed against Servetus by the magistrates of Geneva, with the approbation of a great number of the magistrates and ministers of Switzerland, yet it is the opinion of

most historians that this dreadful sentence was imposed at the instigation of Calvin. This act of severity for holding a speculative opinion, however erroneous and absurd, has left a stain on the character of this illustrious reformer, which will attend the name of Calvin as long as history shall preserve it from oblivion. See CALVIN. Servetus was a man of great acuteness and learning, and well versed in the arts and sciences. In his own profession his genius exerted itself with success. In his tract entitled *Christianismi Restitutio*, published in 1553, he remarks that the whole mass of blood passes through the lungs by the pulmonary artery and vein, in opposition to the opinion which was then universally entertained, that the blood passes through the partition which divides the two ventricles. This was an important step towards the discovery of the circulation of the blood. His works consist of controversial writings concerning the Trinity: an edition of Pagninus's Version of the Bible, with a preface and notes, published under the name of Michael Villanovanus; an *Apology to the Physicians of Paris*; and a book entitled *Ratio Sympliciorum*. Mosheim wrote in Latin *A History of the Heresy and Misfortunes of Servetus*, which was published at Helmstadt, in 4to., in 1728; and is extremely interesting.

SERVIA, a considerable province of European Turkey, the *Mæsia Superior* of the Romans. Its form is nearly oblong, its length being about 190 miles, its breadth 100, and its superficial extent 19,000 square miles. It is an inland province, bounded on the north by a part of the Hungarian frontier, but on all other sides by portions of the Turkish territory, viz. on the west by Bosnia, on the east by Bulgaria, and on the south by Albania. Population about 1,000,000.

Servia is uneven and even mountainous, and its surface contains a number of forests, and large uncultivated heaths. The mountains in the south extend in a regular chain, but throughout the chief part of the province they have little regular connexion. One of the highest is called Haloga, situated to the south-west of Belgrade. The rivers are on its frontiers, viz. the Save and Danube on the north: the Morava on its eastern, the Drina on its western boundary, both flow to the northward until falling into the Danube, after receiving a number of inferior streams. The Danube, in this part of its course, is in many places bordered by lofty rocks, rising almost perpendicularly from the river, or appearing to hang suspended above it. The scenery is highly picturesque.

The *climate* of Servia, though temperate, is less mild than might be expected in 43° and 44° of N. lat., the winter being of considerable length, and spring not beginning till April. This is partly owing to the height of the ridge of the Argentaro or Glubotin mountains, extending along its southern boundary; partly to the number of forests, and the general neglect of cultivation. In the month of June the south-west winds bring on periodical rains, which are succeeded in July and August by great heat, although the nights are generally cool. September is often a rainy month; but, in October and November, the weather is in general pleasant. Its

soil is in general fertile, the cultivated tracts producing abundant crops; but a small proportion of the country is as yet under tillage. The common products are rice, wheat, barley, oats, hemp, flax, and tobacco; also vines and fruits. Cotton is raised in the valleys. Timber is every where abundant, and mines of iron and salt have been discovered in several parts; but are almost entirely neglected: the only articles of export being hemp, wool, flax, and tobacco; cattle and hogs. The manufactures of woollen, cotton, and hardware, are wholly for home consumption. Of large towns, Servia reckons only Belgrade, Semendria, and Nissa; the other places are mere villages, meanly built, and ill peopled. There are, however, spread over the country, many vestiges of antiquity.

The inhabitants of Servia are divided into Servians, Turks, and Jews; the last two found, only in the towns. The Servians were originally a tribe of *Slavonians* from Galicia, in Poland; and are not confined to the territory strictly called Servia, but are spread over other parts of Europe, particularly over a considerable proportion of Hungary. The language has a great resemblance to the Russian. The Servians are not devoid of spirit; but their natural activity is little improved by culture, and debased by bigoted superstition.

On the decline of the empire, Servia shared the fate of the other frontier provinces, and was occupied by invaders, from a tribe of whom, called *Serbis*, or *Serbi*, it received its modern name. In the middle ages it formed a separate and independent kingdom, which yielded to the Turks about the year 1365. The Servians have often since experienced the hardships of a frontier province, and still oftener the unbounded tyranny of its pachas and other provincial governors. A sense of these injuries, and an implacable hatred to the Turks, led to an insurrection about the year 1801. It soon became general, and the Servians flocking round the standard of *Czerai Georges*, previously known only as the head of a band of robbers, honored him with the name of avenger of his country. This chieftain at first confined himself to the forests; in time his followers increased, and found themselves of sufficient strength to meet the enemy in the open country. In December, 1806, he besieged and took Belgrade, after an obstinate resistance, and in a great measure expelled the Turks from the country. The Turks brought from time to time fresh forces against him, which he resisted with various success until 1814, when he judged proper to withdraw into Russia; and by a convention, concluded between his country and the Porte in 1815, the Servians acknowledged the sovereignty of the sultan, but secured the free exercise of their religion, as well as various civil rights. Every father of a family pays a ducat of yearly tax to the Porte, and every other individual a piastre; no Servian can settle in Turkey, nor travel in that country but for commercial purposes. The Turkish division of it is into four sandjagats, viz. Belgrade, Semendria, Novibesar, and Kratow.

SERVIA, or *NEW SERVIA*, a district of European Russia, in the government of Ekaterinoslav, between the Dnieper and the Bog. It takes its

name from a number of Servian hussars and Pandours, who emigrated hither in 1754. Being a frontier province, it has a military form; and the territory is divided into ten districts, each occupied by a regiment.

SERVICE, *n. s.* *Lat. sorbus.* A tree and fruit.

The flower of *service* consists of several leaves, which are placed orbicularly, and expand in form of a rose, whose flower-cup afterwards becomes a fruit shaped like a pear or medlar; to which must be added, pennated leaves like that of the ash.

Miller.

October is drawn in garment of yellow and carnation; in his left hand a basket of *services*, medlars, and other fruits that ripen late.

Peucham.

SERVICE, in law, is a duty which a tenant, on account of his fee, owes to his lord. There are many divisions of services; as, 1. Into personal, where something is to be done by the tenant in person, as homage and fealty. 2. Real, such as wards, marriages, &c. 3. Accidental, including heriots, reliefs, and the like. 4. Entire, where, on the alienation of any part of the lands by a tenant, the services become multiplied. 5. Frank-service, which was performed by freemen, who were not obliged to perform any base service, but only to find a man and horse to attend the lord into the army or to court. 6. Knight's service, by which lands were anciently held of the king, on paying homage, service in war, &c.

SERVICE, in domestic economy. As in every free and well regulated society there must be a great number of persons employed in service, both in agriculture and domestic affairs, in this country service is a contract into which the servant voluntarily enters; and the master's authority extends no farther than to the performance of that species of labor for which the agreement was made. Dr. Paley has some judicious remarks on this subject, in his *Moral and Political Philosophy*, p. 139.

SERVICE, CHORAL, in church history, denotes that part of religious worship which consists in chanting and singing. The advocates for the antiquity of singing, as a part of church music, urge the authority of St. Paul in its favor (*Ephesians* v. 19, and *Colossians* iii. 16), and assert that songs and hymns were from the establishment of the church sung in the assemblies of the faithful. It appears from undoubted testimony that singing, which was practised as a sacred rite among the Egyptians and Hebrews at a very early period, and which likewise constituted a considerable part of the religious ceremonies of the Greeks and Romans, made a part of the religious worship of Christians, not only before churches were built and their religion established by law, but from the first profession of Christianity. However, others have dated the introduction of music into the service of the church in that period during which *Leontius* governed the church of Antioch, i. e. between A. D. 347 and 356. See *ANTIPHONY*. From Antioch the practice soon spread through the other churches of the east; and, in a few ages after its first introduction into the divine service, it not only received the sanction of public authority, but those were forbid to join in it who were ignorant of music, by a canon of the council of

Laodicea, about A. D. 372. Singing was introduced into the western churches by St. Ambrose about A. D. 374, who was the institutor of the Ambrosian chant established at Milan about 386; and Eusebius (lib. ii. cap. 17) tells us that a regular choir, and method of singing the service, were first established, and hymns used in the church at Antioch, during the reign of Constantine; and that St. Ambrose, who had long resided there, had his melodies thence. This was about 230 years afterwards amended by pope Gregory the Great, who established the Gregorian chant; a plain, unisonous, kind of melody. This still prevails in the Roman church; it is known in Italy by the name of *canto fermo*; and in Germany and most other countries by that of the *cantus Gregorianus*. All writers on this subject agree that St. Ambrose only used the four authentic modes, and that the four plagal were added by St. Gregory. Each of these had the same final, or key-note, as its relative authentic: from which there is no other difference, than that the melodies in the four authentic or principal modes are generally confined within the compass of the eight notes above the key-note, and those in the four plagal or relative modes, within the compass of the eight notes below the fifth of the key. See *MON.* Ecclesiastical writers unanimously allow that pope Gregory, about 590, collected the musical fragments of such ancient psalms and hymns as the first fathers of the church had approved and recommended to the first Christians; and that he selected, methodised, and arranged them in the order which was long continued at Rome, and soon adopted by the chief part of the western church. From the time of Gregory to that of Guido there was no other distinction of keys than that of authentic and plagal; nor were any semitones used but those from E to F, B to C, and occasionally A to B \flat . With respect to the music of the primitive church, though it consisted in the singing of psalms and hymns, yet it was performed in many different ways; sometimes the psalms were sung by one person alone, whilst the rest attended in silence; sometimes they were sung by the whole assembly; sometimes alternately, the congregation being divided into separate choirs; and sometimes by one person, who repeated the first part of the verse, the rest joining in the close of it. Of these four methods of singing, the second and third were named *symphony* and *antiphony*; and the latter was sometimes called *responsaria*, in which women were allowed to join. St. Ignatius is said to have been the first who suggested to the primitive Christians in the east the method of singing hymns and psalms alternately, or in dialogue; and the custom soon prevailed in every place where Christianity was established; though Theodoret in his history (lib. ii. cap. 24), tells us that this manner of singing was first practised at Antioch. It is the opinion of the learned Martini that the music of the first five or six ages of the church consisted chiefly in a simple chant of unisons and octaves, of which many fragments are still remaining in the *canto fermo* of the Romish missals. For, with respect to music in parts, it does not appear in these early ages that

either the Greeks or Romans were in possession of harmony or counterpoint, which has been generally ascribed to Guido, a monk of Arezzo in Tuscany, about 1022. See *ARETIN*. The choral music, which had its rise in the church of Antioch, and thence spread through Greece, Italy, France, Spain, and Germany, was brought into Britain by the singers who accompanied Austin the monk, when he came over, in 596, with a commission to convert the inhabitants of this country to Christianity. Bede tells us that when Austin and the companions of his mission had their first audience of king Ethelbert, in the Isle of Thanet, they approached him in procession, singing litanies, and that some time afterwards, when they entered Canterbury, they sung a litany, and at the end of it, *Hallelujah*. But, though this was the first time the Anglo-Saxons had heard the Gregorian chant, yet Bede tells us that our British ancestors had been instructed in the rites and ceremonies of the Gallican church by St. Germanus, and heard him sing *Hallelujah* many years before the arrival of St. Austin. In 680 John, precentor of St. Peter's in Rome, was sent over by pope Agatho to instruct the monks of Weremouth in the art of singing; and he was prevailed upon to open schools for teaching music in other places in Northumberland. Benedict Biscop, the preceptor of Bede, Adrian the monk, and many others contributed to disseminate the knowledge of the Roman chant. At length, the successors of St. Gregory and of Austin having established a school for ecclesiastical music at Canterbury, the rest of the island was furnished with masters from it. The choral service was first introduced in the cathedral church of Canterbury; and till the arrival of Theodore, and his settlement in that see, the practice of it seems to have been confined to the churches of Kent; but after that it spread over the whole kingdom. This mode of religious worship prevailed in all the European churches till the Reformation: the first deviation from it is that which followed the Reformation by Luther, who, being himself a lover of music, formed a liturgy, which was a musical service, in a work entitled *Psalmodia*, h. e. *Cantica sacra Veteris Ecclesie selecta*, printed at Norimberg in 1553, and at Wittenberg in 1561. But Calvin, in his establishment of a church at Geneva, reduced the whole of divine service to prayer, preaching, and singing; the latter of which he restrained. He excluded the offices of the antiphon, hymn, and motet, of the Romish service, with that artificial and elaborate music to which they were sung; and adopted only that plain metrical psalmody, which is now in general use among the reformed churches, and in all the parish churches of Scotland. For this purpose he used Marot's version of the Psalms, and employed a musician to set them to easy tunes only of one part. In 1553 he divided the Psalms into small portions, and appointed them to be sung in churches. Soon after they were bound up with the Geneva catechism; from which time the Catholics were forbid the use of them, under a severe penalty. Soon after the Reformation in England, complaints were made by many of the dignified clergy and others of the intricacy and

difficulty of the church music of those times : in consequence of which it was once proposed that organs and curious singing should be removed from the English churches. Latimer, in his diocese of Worcester, went still farther, and issued injunctions to the prior and convent of St. Mary, forbidding in their service all manner of singing. In the reign of Edward VI. a commission was granted to eight bishops, eight divines, eight civilians, and eight common lawyers, to compile a body of ecclesiastical laws to be observed throughout the realm. The result was a work first published by Fox the martyrologist, in 1571, and afterwards in 1640, under the title of *Reformatio Legum Ecclesiasticarum*. These thirty-two commissioners, instead of reprobating church music, merely condemned figurative and operose music, or that kind of singing which abounded with fugues, responsive passages, and a commixture of various and intricate proportions ; which is by musicians termed *descant*. However, notwithstanding the objections against choral music, the compilers of the English liturgy in 1548, and the king himself, determined to retain musical service. Accordingly, the stat. 2 and 3, Edward VI. c. 1, clearly recognises the practice of singing ; and in 1550 a formula was composed, which continues with little variation, to be the rule for choral service at this day. The author of this work was John Marbecke, or Marbeike : and it was printed by Richard Grafton, in 1550, under the title of the *Book of Common Prayer*, noted. Queen Mary labored to re-establish the Roman choral service ; but the accession of Elizabeth was followed by the act of uniformity ; in consequence of which, and of the queen's injunctions, the *Book of Common Prayer*, noted by Marbecke, was considered as the general formula of choral service. In 1560 another musical service, with some additions and improvements, was printed by John Day ; and in 1565 another collection of offices, with musical notes. Many objections were urged by Cartwright and other Puritans, against the form and manner of cathedral service, to which Hooker replied in his *Ecclesiastical Polity*. In 1654 the statutes of Edward VI. and Elizabeth for uniformity in the *Common Prayer* were repealed ; and the *Directory for Public Worship*, which allows only of the singing of psalms, established. But upon the restoration of Charles II. choral service was revived, and has since uniformly continued. See Hawkins's *History of Music*, vol. i. p. 404, vol. ii. p. 261, vol. iii. p. 58—463, &c, vol. iv. p. 44—347.

SERVILE, *adj.* } Fr. *servil* ; Lat. *servilis*. Slavish ; depend-
 SERVILELY, *adv.* }
 SERVILENESS, *n. s.* } ent ; mean : the adverb
 SERVILITY. } and noun-substantive
 corresponding.

The most *servile* flattery is lodged the most easily in the grossest capacity ; for their ordinary conceit draweth a yielding to their greater, and then have they not wit to discern the right degrees of duty.

Sidney.

Fight and die, is death destroying death ;
 While fearing dying, pays death *servile* breath.

Shakspeare.

To be queen in bondage is more vile
 Than is a slave in base *servility* ;
 For princes should be free.

Id. Henry VI.

From imposition of strict laws to free
 Acceptance of large grace, from *servile* fear
 To filial.

Milton.

T' each changing news they changed affections
 bring,

And *servilely* from fate expect a king.

Dryden's *Aurengzebe*.

What, besides this unhappy *servility* to custom,
 can possibly reconcile men, that own christianity, to
 a practice widely distant from it ?

Government of the Tongue.

Even fortune rules no more a *servile* land,
 Where exil'd tyrants still by turns command.

Pope.

He affects a singularity in his actions and thoughts,
 rather than *servilely* to copy from the wisest.

Swift.

She must bend the *servile* knee,
 And fawning take the splendid robber's boon.

Thomson.

The angels and dæmons, those by their subservi-
 ence, and these by the *servility* of their obedience,
 manifestly declared Christ and his apostles to be
 vested with an authority derived from their Lord.

West.

SERVILIA, a sister of the celebrated Cato of Utica, who was deeply enamoured of Julius Cæsar, though her brother was one of his most inveterate enemies. One day she sent Cæsar a letter full of the most tender expressions of affection. This epistle was delivered to Cæsar in the senate-house, while the senate were debating about the punishing of Catiline's associates. Cato, supposing that the letter was from one of the conspirators, insisted on its being publicly read. Upon this Cæsar gave it to Cato, who, having read it, returned it, saying, 'Take it, Drunkard !' From his connexion with Servilia, Cæsar is generally believed to have been the father of the famous patriot, Marcus Brutus, whose parricidal hand, in spite of numberless favors bestowed on him by Cæsar, was joined with those of the other conspirators in Cæsar's murder. This seems to be confirmed by Cæsar's dying words : 'Et tu, mi fili, Brute !' See *Rome*.

SERVILIUS (Ahala), a celebrated Roman, whom the dictator Cincinnatus appointed his master of horse, and who slew Mælius for refusing to obey the dictator's summons. For this he was banished, but was soon recalled, and was afterwards raised to the dictatorship.

SERVILIUS (Nonianus), a Latin historian, who flourished under Nero, and wrote a *History of Rome*, which is lost.

SERVITES, a religious order in the church of Rome, founded about 1233, by seven Florentine merchants, who, with the approbation of the bishop of Florence, renounced the world, and lived together in a religious community on Mount Senar, two leagues from that city.

SERVITOR, *n. s.* Fr. *serviteur*. Servant ; attendant. Obsolete.

This workman, whose *servitor* nature is, being only one, the heathens imagining to be more, gave him in the sky the name of Jupiter ; in the air of Juno ; in the water of Neptune ; in the earth of Vesta and Ceres.

Hooker.

Thus are poor *servitors*,
When others sleep upon their quiet beds,
Constrained to watch in darkness, rain, and cold.
Shakspeare.

My noble queen, let former grudges pass,
And henceforth I am thy true *servitor*.
Id. Henry VI.

Our Norman conqueror gave away to his *servitors*
the lands and possessions of such as did oppose his
invasion.
Davies.

His learning is much of a size with his birth and
education; no more of either than what a poor
hungry *servitor* can be expected to bring with him
from his college.
Swift.

SERVITOR, in the university of Oxford, a student who attends on another for his maintenance and learning. See **SIZAR**.

SERVITUDE, the condition of a servant, or rather slave. On the declension of the Roman empire, a new kind of servitude was introduced, different from that of the ancient Romans; it consisted in leaving the lands of subjugated nations to the first owners, upon condition of certain rents, and servile offices, to be paid in acknowledgment. Hence the names of *servi censi*, *ascriptitii*, and *addicti glebæ*; some whereof were taxable at the reasonable discretion of the lord; others at a certain rate agreed on; and others were mainmortal, who, having no legitimate children, could not make a will to above the value of *5d.*, the lord being heir to all the rest; and others were prohibited marrying, or going to live out of the lordship. Most of these servitudes existed in France till the Revolution; but they were long ago abolished in England. Such, however, was the original of our tenures, &c. See **SLAVE**.

SERVIVS GALBA. See **GALBA** and **ROME**.

SERVIVS MAURUS HONORIATVS, a celebrated grammarian and critic of antiquity, who flourished about the time of Arcadius and Honorius; now chiefly known by his Commentaries on Virgil. There is also extant his work upon the feet of verses and the quantity of syllables, called *Centimetrum*.

SERVIVS TULLIVS, the sixth and best king of Rome. See **ROME**.

SERUM, *n. s.* Lat. *serum*. The thin and watery part that separates from the rest in any liquor: particularly the part of the blood which in coagulation separates from the grume.

Blood is the most universal juice in an animal body: the red part of it differs from the *serum*, the *serum* from the lymph, the lymph from the nervous juice, and that from the several other humours separated in the glands.
Arbutnot.

SERUM is a thin, transparent, saltish liquor, which makes a considerable part of the mass of blood. See **ANATOMY** and **BLOOD**.

The chemical properties and phenomena of *serum* are thus enumerated by Dr. Thomson, in his *System of Chemistry*:—"The *serum* is of a light greenish yellow color; it has the taste, smell, and feel of the blood, but its consistence is not so great. Its mean specific gravity is about 1.0287. It converts syrup of violets to a green, and therefore contains an alkali. On examination, Rouelle found that it owes this property to a portion of soda. When heated to the temperature of 156°, the *serum* coagulates, as Har-

vey first discovered. It coagulates also when boiling water is mixed with it; but, if *serum* be mixed with six parts of cold water, it does not coagulate by heat. When thus coagulated, it has a greyish white color, and is not unlike the boiled white of an egg. If the coagulum be cut into small pieces, a muddy fluid may be squeezed from it, which has been termed the *serosity*. After the separation of this fluid, if the residuum be carefully washed in boiling water and examined, it will be found to possess all the properties of albumen. The *serum* therefore contains a considerable proportion of albumen. Hence its coagulation by heat, and the other phenomena, which albumen usually exhibits. If *serum* be diluted with six times its quantity of water, and then boiled to coagulate the albumen, the liquid which remains after the separation of the coagulum, if it be gently evaporated till it becomes concentrated, and then be allowed to cool, assumes the form of a jelly, as was first observed by D. Haen. Consequently it contains gelatine. If the coagulated *serum* be heated in a silver vessel, the surface of the silver becomes black, being converted into a sulphuret. Hence it is evident that it contains sulphur; and Proust has ascertained that it is combined with ammonia, in the state of hydrosulphuret. If *serum* be mixed with twice its weight of water, and after coagulation by heat, the albumen be separated by filtration, and the liquid be slowly evaporated till it is considerably concentrated, a number of crystals are deposited, when the liquid is left standing in a cool place. These crystals, first examined by Rouelle, consist of carbonate of soda, muriate of soda, phosphate of soda, and phosphate of lime. The soda exists in the blood in a caustic state, and seems to be combined with the gelatine and albumen. The carbonic acid combines with it during evaporation. Thus it appears that the *serum* of the blood contains albumen, gelatine, hydrosulphuret of ammonia, soda, muriate of soda, phosphate of soda, and phosphate of lime. These component parts account for the coagulation occasioned in the *serum* by acids and alcohol, and the precipitation produced by tin, acetite of lead, and other metallic salts."

SESAMOIDEA OSSA, certain small bones somewhat resembling the seeds of sesamum, whence their name. They are placed at the under part of the bones of the last joints of the fingers and toes.

SESAMUM, oily grain, in botany, a genus of plants belonging to the class of didynamia, and to the order of angiospermia; natural order twentieth, *luridæ*: *CAL.* divided into five parts: *COR.* campanulate, the tube of which is nearly the length of the calyx: the throat is inflated, and very large; the border is divided into five parts, four of which are spreading and nearly equal; the fifth is the lowest and largest. There are four filaments, and the rudiments of a fifth. The stigma is lanceolate: *CAPS.* has four cells. There are only two species, viz:—1. *S. Indicum*, with trifid lower leaves, grows naturally in India: this is an annual plant; the stalk rises taller than that of the orientale; the lower leaves are cut into three parts which is the only difference

between them. 2. *S. orientale*, has ovate, oblong, entire leaves. It is an annual, and grows naturally on the coast of Malabar, and in the island of Ceylon; rising with an herbaceous four cornered stalk, two feet high, sending out a few short side branches; the leaves are oblong, oval, a little hairy, and stand opposite. The flowers terminate the stalks in loose spikes; they are small, of a dirty white color, shaped somewhat like those of the fox-glove. After the flowers are past, the germen turns to an oval acute-pointed capsule with four cells, filled with oval compressed seeds, which ripen in autumn. It is often cultivated in all the eastern countries, and also in Africa, as a pulse; and of late years the seeds have been introduced into Carolina by the African negroes, where they succeed extremely well. The inhabitants of that country make an oil from the seed, which will keep good many years, without having any rancid smell or taste, but in two years become quite mild; so that when the warm taste of the seed, which is in the oil when first drawn, is worn off, they use it as a salad oil, and for all the purposes of sweet oil. The seeds of this plant are also used by the negroes for food; which seeds they parch over the fire, and then mix them with water, and stew other ingredients with them, which makes an hearty food. Sometimes a sort of pudding is made of these seeds, in the same manner as with millet or rice, and is by some persons esteemed, but is rarely used for these purposes in Europe. This is called benny or bounny in Carolina. In England these plants are preserved in botanic gardens as curiosities. Their seeds must be sown in the spring upon a hot-bed; and, when the plants are come up, they must be transplanted into a fresh hot-bed to bring them forward. After they have acquired a tolerable degree of strength, they should be planted into pots, and plunged into another hot-bed, managing them as has been directed for amaranthus; for, if these plants are not thus brought forward in the former part of the summer, they will not produce good seeds in this country. From 9 lbs. of this seed which came from Carolina, there were upwards of two quarts of oil drawn, which is as great a quantity as has been obtained from any vegetable whatever. This might occasion its being called the oily grain.

SESEL, meadow saxifrage, or hartwort of Marseilles, in botany, a genus of plants belonging to the class of pentandria, and to the order of digynia; natural order forty-fifth, umbellatæ. The umbels are globular; the involucre consists of one or two leaflets; the fruit is egg-shaped and streaked. There are eleven species, viz.:—1. *S. ammoides*; 2. *Annum*; 3. *Elatum*; 4. *Glaucum*; 5. *Hyppomarathrum*; 6. *Montanum*; 7. *Pimpinelloides*; 8. *Pyrenæum*; 9. *Saxifragum*; 10. *Tortuosum*; and, 11. *Turbithum*. Of these, 1. *S. ammoides* grows in the south of Europe; 2. *S. glaucum* is a native of France; 3. *S. hyppomarathrum*, of Austria; 4. *S. montanum*, of France and Italy; 5. *S. tortuosum*, of the south of Europe.

SESIA, SEZIA, or SESSIA, a river of the French empire, which rises in the Alps, on the borders of the ci-devant province of Valais, runs through

part of the late Piedmontese, waters the ci-devant lordship of Vercelli, and gives it its present name; and falls into the Po, a little below Casal.

SEZIA, or SEZIA, a department of the French empire, one of the six into which the ci-devant principalities of Piedmont, Montferrat, &c., were divided on the 11th of September 1802. It comprehends the late lordship of Vercelli, and some adjacent districts. Vercelli is the capital.

SESOSTRIS, king of Egypt. See EGYPT, ETHIOPIA, and SHISHAK. Besides being a great conqueror, some say he taught the Egyptians astronomy. See ASTRONOMY.

SESQUI, a Latin particle, signifying a whole and a half; which, joined with altera, terza, quarta, &c., is much used in the Italian music to express a kind of ratios, particularly several species of triples.

SESQUIALTER, *adj.* } Fr. *sesquialtre*;
SESQUIALTERAL. } Lat. *sesquialter*. In geometry, a ratio where one quantity or number contains another once and a half as much more, as 6 and 9.

As the six primary planets revolve about the sun, so the secondary ones are moved about them, in the same *sesquialteral* proportion of their periodical motions to their orbs. Bentley.

In all the revolutions of the planets about the sun, and of the secondary planets about the primary ones, the periodical times are in a *sesquialter* proportion to the mean distance. Cheyne.

SESQUIALTERAL, or SESQUIALTERATE, in geometry and arithmetic: e. g. 6 and 9 are in a *sesqui-alterate-ratio*; since 9 contains 6 once, and 3, which is half of 6, over; and 20 and 30 are in the same; as 30 contain 20, and half 20 or 10.

SESQUI-DUPLICATE ratio is when of two terms the greater contains the less twice, and half the less remains; as 15 and 6; 50 and 20.

SESQUIPEDAL, *adj.* } Lat. *sesquipedalis*.
SESQUIPEDALIAN. } Containing a foot and a half.

As for my own part, I am but a *sesquipedal*, having only six foot and a half of stature.

Addison's Guardian.

Hast thou ever measured the gigantic Ethiopian, whose stature is above eight cubits high, or the *sesquipedalian* pigmy? Arbuthnot and Pope.

SESQUIPLICATE, *adj.* From *sesqui* and *plicatus*. In mathematics. The proportion one quantity or number has to another, in the ratio of one half.

The periodical times of the planets are in *sesquiplicate* proportion, and not a duplicate proportion of the distances from the center of the radii; and consequently the planets cannot be carried about by an harmonically circulating fluid.

Cheyne's Philosophical Principles.

SESS, *n. s.* For assess, cess, or cense. Rate; cess charged; tax.

His army was so ill paid and governed, as the English suffered more damage by the *sess* of his soldiers, than they gained profit or security by abating the pride of their enemies.

Davies's History of Ireland.

SESSION, *n. s.* Fr. *session*; Lat. *sessio*. The act of sitting; emphatically, a public or official sitting of magistrates, or public officers: hence,

the time during which such an assembly continues to sit.

He hath as man, not as God only, a supreme dominion over quick and dead ; for so much his ascension into heaven, and his *session* at the right hand of God, do import. *Hooker.*

They are ready to appear
Where you shall hold your *session*.

Shakspeare. King Lear.

Summon a *session*, that we may arraign
Our most disloyal lady. *Shakspeare.*

The old man, mindful still of moan,
Weeping, thus bespake the *session*.

Chapman's Odyssey.

* Many, though they concede a table-gesture, will hardly allow this usual way of *session*.

Brownie's Vulgar Errors.

It was contrary to the course of parliament that any bill that had been rejected should be again preferred the same *session*. *Clarendon.*

Of this *session* ended they bid cry
The great result. *Milton.*

The second Nicene council affords us plentiful assistance in the first *session*, wherein the pope's vicar declares that Meletius was ordained by Arian bishops, and yet his ordination was never questioned. *Stillingfleet.*

Many decrees are enacted, which at the next *session* are repealed. *Norris.*

Called to council all the Achaian states,
Nor herald sworn the *session* to proclaim.

Pope's Odyssey.

SESSION, KIRK, the lowest ecclesiastical court in Scotland. See **KIRK SESSION**. A kirk-session, when regularly constituted, must always consist of the minister, elder, session-clerk, and kirk-treasurer. None of these ever receive any salary except the session-clerk, who is usually the schoolmaster of the parish, and has a small salary allowed for minuting the transactions. The kirk-treasurer is for the most part one of the elders ; and he is an important member of this court. Without his intervention no distribution of the poor's funds is deemed legal ; nor can any payments be made, receipts granted, or money transferred, but by him ; the minister and session being personally liable to make good all money that may otherwise be given away, should it ever afterwards be challenged by any heritor in the parish.

SESSION OF PARLIAMENT, the time from its meeting to its prorogation. See **PARLIAMENT**.

SESSIONS for weights and measures. In London, four justices from among the mayor, recorder, and aldermen (of whom the mayor or recorder is to be one), may hold a session to enquire into the offences of selling by false weights and measures, contrary to the statutes ; and to receive indictments, punish offenders, &c. *Char. king Charles I.*

SESSIONS, QUARTER, or COURT OF QUARTER SESSIONS, an English court that must be held in every county once in every quarter of a year : which, by stat 2 Hen. V. c. 4, is appointed to be in the first week after Michaelmas day, the first week after the epiphany, the first week after the close of Easter, and in the week after the translation of St. Thomas the martyr, or the 7th of July. It is held before two or more justices of the peace, one of which must be of the quorum. The jurisdiction of this court, by 34 Edw.

III. c. 1, extends to the trying and determining all felonies and trespasses whatsoever : though they seldom, if ever, try any greater offence than small felonies within the benefit of clergy ; their commission providing, that if any case of difficulty arises, they shall not proceed to judgment, but in the presence of one of the justices of the courts of king's bench or common pleas, or one of the judges of assize : and therefore murders, and other capital felonies, are usually remitted for a more solemn trial to the assizes. Neither can they try any new-created offence, without express power given them by the statute which creates it. But there are many offences and particular matters which, by particular statutes, belong properly to this jurisdiction, and ought to be prosecuted in this court ; as, the smaller misdemeanors against the public, not amounting to felony ; and especially offences relating to the game, highways, ale-houses, bastard children, the settlement and provision for the poor, vagrants, servants' wages, and Popish recusants. Some of these are proceeded upon by indictment ; others in a summary way, by motion, and order thereupon ; which order may for the most part, unless guarded against by particular statutes, be removed into the court of king's bench by writ of certiorari facias, and be there either quashed or confirmed. The records or rolls of the sessions are committed to the custody of a special officer, styled *custos rotulorum*, who is always a justice of the quorum ; and among them of the quorum (saith Lambard) a man for the most part especially picked out, either for wisdom, countenance, or credit. The nomination of the *custos rotulorum* (who is the principal officer in the county, as the lord-lieutenant is chief in military command) is by the king's sign-manual ; and to him the nomination of the clerk of the peace belongs ; which office is expressly forbidden to sell for money. In most corporate towns there are quarter sessions kept before justices of their own, within their respective limits ; which have exactly the same authority as the general quarter sessions of the county, except in a very few instances ; one of the most considerable of which is the matter of appeals from orders of removal of the poor, which, though they be from the orders of corporation justices, must be to the sessions of the county, by stat. 8 and 9 W. III. c. 30. In both corporations and counties at large there is sometimes kept a special or petty session, by a few justices, for despatching smaller business in the neighbourhood between the times of the general sessions ; as for licensing ale houses, passing the account of parish-officers, and the like.

SESSITES, in ancient geography, a river of Gallia Cisalpinia, running into the Eridanus (*Plin. iii. c. 16*), now called Sesia.

SESTERCE, *n. s.* *Fr. sesterce* ; *Lat. sestertium*. Among the Romans, a sum of about £8 1s. 5½d. sterling. See below.

Several of them would rather chuse a sum in *sesterces*, than in pounds sterling. *Addison on Medals.*

SESTERCE, **SESTERTIUS**, a silver coin, in use among the ancient Romans, called also simply *nummus*, and sometimes *nummus sestertius*. The sestertius was the fourth part of the dena-

rius, and originally contained two asses and a half. It was at first denoted by LLS; the two L's signifying two libræ, and the S half. But the librarii, afterwards converting the two L's into an H, expressed the sestertius by HS. The word sestertius was first introduced by way of abbreviation for semistertius, which signifies two, and a half of a third, or, literally, only half a third; for, in expressing half a third, it was understood that there were two before. Some authors make two kinds of sestercies; the less called sestertius, in the masculine gender; and the great one, called sestertium, in the neuter: the first, that we have already described; the latter containing 1000 of the other. Others will have any such distinction of great and little sestercies unknown to the Romans: sestertius, say they, was an adjective, and signified as sestertius, or two asses and a half; and when used in the plural, as in *quinquaginta sestertiûm*, or *sestertia*, it was only by way of abbreviation, and there was always understood *centena millia*, &c. This matter has been accurately stated by Mr. Raper, in the following manner:—The substantive to which sestertius referred is either *as*, or *pondus*; and sestertius as is two asses and a half; sestertium *pondus*, two *pondera* and a half, or 250 denarii. When the denarius passed for ten asses, the sestertius of two asses and a half was a quarter of it; and the Romans continued to keep their accounts in these sestercies long after the denarius passed for sixteen asses; till, growing rich, they found it more convenient to reckon by quarters of the denarius, which they called *nummi*, and used the words *nummus* and *sestertius* indifferently, as synonymous terms, and sometimes both together, as *sestertius nummus*; in which case the word *sestertius*, having lost its original signification, was used as a substantive; for *sestertius nummus* was not two *nummi* and a half, but a single *nummus* of four asses. They called any sum under 2000 sestercies so many *sestertii*, in the masculine gender; 2000 sestercies they called *duo*, or *bina sestertia*, in the neuter; so many quarters making 500 denarii, which was twice the *sestertium*; and they said *dena*, *vicena*, &c., *sestertia*, till the sum amounted to 1000 *sestertia*, which was 1,000,000 of sestercies. But, to avoid ambiguity, they did not use the neuter *sestertium* in the singular number, when the whole sum amounted to no more than 1000 sestercies, or one *sestertium*. They called 1,000,000 of sestercies *decies nummum*, or *decies sestertiûm*, for *decies-centena millia nummorum*, or *sestertiorum* (in the masculine gender), omitting *centena millia* for the sake of brevity. They likewise called the same sum *decies sestertiûm* (in the neuter gender) for *decies centies sestertiûm*, omitting *centies* for the same reason; or simply *decies*, omitting *centena millia sestertiûm*, or *centies sestertium*; and with the numeral adverbs *decies*, *vicies*, *centies*, *millies*, and the like, either *centena millia*, or *centenies*, was always understood. These were their most usual forms of expression; though for *bina*, *dena*, *vicena*, *sestertia*, they frequently said *bina*, *dena*, *vicena millia nummum*. If the consular denarius contained sixty Troy grains of fine silver, it was worth somewhat

more than eight pence farthing and a half sterling; and the *as*, of sixteen to the denarius, a little more than a half-penny. To reduce the ancient sestercies of two asses and a half, when the denarius passed for sixteen, to pounds sterling, multiply the given number by 5454, and cut off six figures on the right hand for decimals. To reduce *nummi-sestertii*, or quarters of the denarius, to pounds sterling; if the given sum be consular money, multiply it by 8727, and cut off six figures on the right hand for decimals; but for imperial money diminish the same product by one-eighth of itself.—Philosophical Transactions, vol. lxi. part ii. art. 48. To be qualified for a Roman knight an estate of 400,000 sestercies was required; and for a senator. of 800,000.

SESTERCE, or SESTERTIUS, was also used by the ancients for a thing containing two wholes and a half of another, as *as* was taken for any whole or integer.

SESTERCE, COPPER, was worth about one-third of a penny English.

SESUVIUM, an ancient nation of Gallia Celtica. Cæs. de Bello Gall.

SESUVIUM, in botany, a genus of the *icosaandria* class and *tryginia* order of plants: *cal.* colored and divided into five parts; there are no *petals*: *caps.* egg-shaped, three celled, opening horizontally about the middle, and containing many seeds. There is only one species. *S. portulacastrum*, purslane-leaved *sesuvium*, which is a native of the West Indies.

SETT, *v. a. & v. n., part. adj. & n. s.* } Sax. *re-*
SETTER, *n. s.* } *tan*; Goth.

SETTING-DOG. } *seta*; Belg.

setten; perhaps of Lat. *sedeo*. To place; put; fix; plant; adjust; regulate; value; adapt; set to music; variegate; intersperse with any thing; re-fix in a natural state; determine; predetermine; appoint; exhibit; display (taking *before*). This verb takes in composition almost all the prepositions after it; and the extracts below seem sufficient to illustrate their meaning: as a verb neuter to set means to be fixed; put one's self into a particular state, as of removal, commencement of a journey, &c.; applying one's self; plant: and in respect to the heavenly bodies, to fall below the horizon: hence to be extinguished or darkened, applied both to the eyes and in a general metaphorical sense: the verb neuter also takes after it various prepositions. See below. Set, as an adjective, means fixed; regular; according to rule: as a noun substantive, a fixed number or order of things; something planted, not sown; the apparent fall of a heavenly body below the horizon; a wager at dice; a game: a setter is applied generally, and particularly to a man who acts as a setting-dog at game, or as one taught to find game and point it out to the sportsman.

God set them in the firmament, to give light upon the earth. Gen. i. 17.

The sun was set.

Every sabbath ye shall set it in order.

Id. xxviii. 11.

Lev. xxiv. 8.

Unto thy brother thou shalt not lend upon usury, that the Lord may bless thee in all that thou *settest* thine hand to. Deuteronomy.

Ahijah could not see ; for his eyes were *set*, by reason of his age. *1 Kings* xiv. 4.

Thou shalt pour out into all those vessels, and *set* aside that which is full. *2 Kings* iv. 4.

It pleased the king to send me, and I *set* him a time. *Neh.* ii.

Am I a sea, or a whale, that thou *settest* a watch over me ? *Job* vii. 12.

He *setteth* an end to darkness, and searcheth out all perfection. *Id.* xxviii. 3.

They that are younger than I have me in derision, whose fathers I would have disdained to have *set* with the dogs of my flock. *Id.* xxx. 1.

The proud have laid a snare for me, they have *set* gins. *Psalms.*

Because sentence against an evil work is not executed speedily, the heart of men is fully *set* in them to do evil. *Eccles.*

There is not a more wicked thing than a covetous man ; for such an one *setteth* his own soul to sale. *Ecclesi.* x. 9.

I will *set* mine eyes upon them for good, and bring them again to this land. *Jer.* xxiv. 6.

The fathers have eaten a sour grape, and the children's teeth are *set* on edge. *Id.* xxxi. 29.

I am come to *set* a man at variance against his father. *Matthew.*

He seemeth to be a *setter* forth of strange gods. *Acts* xvii.

Set your affections on things above, not on things on the earth. *Col.* iii. 2.

When he was gone I cast this book away : I could not look upon it but with weeping eyes, in remembering him who was the only *setter* on to do it. *Ascham.*

They thought the very disturbance of things established an hire sufficient to *set* them on work. *Hooker.*

We may still doubt whether the Lord, in such indifferent ceremonies as those whereof we dispute, did frame his people of *set* purpose unto an utter dissimilitude with Egyptians, or with any other nation. *Id.*

After it was framed, and ready to be *set* together, he was, with infinite labour and charge, carried by land with camels through that hot and sandy country. *Knolles.*

He would not perform that service by the hazard of one *set* battle, but by dallying off the time. *Id.*

Ere I could
Give him that parting kiss which I had *set*
Betwixt two charming words, comes in my father. *Shakspeare.*

That man that sits within a monarch's heart,
Would he abuse the countenance of the king,
Alack, what mischiefs might he *set* abroad ! *Id.*

This present enterprise *set* off his head,
I do not think a braver gentleman
Is now alive. *Id.* *Henry IV.*

Can honour *set* to a leg ? no : or an arm ? no :
honour hath no skill in surgery then ? no.

Shakspeare. *Henry IV.*
Be you contented
To have a son *set* your decrees at nought,
To pluck down justice from your awful bench ?
Shakspeare.

Who *sets* me else ? I'll throw at all.
Id. *Richard II.*
Will you *set* your wit to a fool's ? *Shakspeare.*

That I might sing it, madam, to a tune,
Give me a note : your ladyship can *set*,
—As little by such toys as may be possible. *Id.*

On Wednesday next, Harry, thou shalt *set* forward,
On Thursday we ourselves will march. *Id.*

If they *set* down before 's, 'fore they remove
Bring up your army. *Id.*

Rude am I in my speech,
And little blessed with the *set* phrase of peace.
Id. *Othello.*

Shameless Warwick, peace !
Proud *setter* up and puller down of kings !
Id. *Henry VI.*

The weary sun hath made a golden *set* ;
And, by the bright track of his fiery car,
Gives signal of a goodly day to-morrow.
Id. *Richard III.*

Have I not here the best cards for the game,
To win this easy match play'd for a crown ?
And shall I now give o'er the yielded *set* ?
Shakspeare.

The shipping might be *set* on work by fishing, by transportation from port to port. *Bacon.*

Whatsoever fruit useth to be *set* upon a root or a slip, if it be sown will degenerate. *Id.* *Natural History.*

In studies, whatsoever a man commandeth upon himself, let him *set* hours for it ; but whatsoever is agreeable to his nature, let him take no care for any *set* times ; for his thoughts will fly to it of themselves so as the spaces of other business or studies will suffice. *Bacon.*

Through the variety of my reading, I *set* before me many examples both of ancient and latter times. *Id.*

Grief he tames that fetters it in verse ;
But when I have done so,
Some man, his art or voice to show,
Doth *set* and sing my pain ;
And, by delighting many, frees again
Grief, which verse did restrain. *Donne.*

Hereon the prompter falls to flat railing, in the bitterest terms ; which the gentleman, with a *set* gesture and countenance, still soberly related ; until the ordinary, driven at last into a mad rage, was fain to give over. *Carew.*

In court they determine the king's good by his desires, which is a kind of *setting* the sun by the dial. *Suckling.*

For using *set* and prescribed forms, there is no doubt but that wholesome words, being known, are aptest to excite judicious and fervent affections. *King Charles.*

Considering what an orderly life I had led, I only commanded that my arm and leg should be *set*, and my body anointed with oil. *Herbert.*

If he *sets* industriously and sincerely to perform the commands of Christ, he can have no ground of doubting but it shall prove successful to him. *Hammond.*

That this may be done with the more advantage, some hours must be *set* apart for this examination. *Duppa.*

When we are well, our hearts are *set*,
Which way we care not, to be rich or great. *Denham.*

Though *set* form of prayer be an abomination,
Set forms of petitions find great approbation. *Id.*

By his aid aspiring
To *set* himself in glory above his peers. *Milton.*

As with stars, their bodies all,
And wings, were *set* with eyes. *Id.*

Set not thy heart
Thus overfond on that which is not thine. *Id.*

His seed, when is not *set*, shall bruise my head. *Id.*

Reject not then, what offered means : who knows
But God hath *set* before us to return thee,
Home to thy country and his sacred house ? *Id.*

Whereas the *setting* of the plicades and seven

stars is designed the term of autumn and the beginning of winter, unto some latitudes the stars do never *set*. *Browne's Vulgar Errors.*

In gard'ning ne'er this rule forget,
To sow dry, and set wet. *Old Proverb.*

Equal success had set these champions high,
And both resolved to conquer or to die. *Waller.*

Joy salutes me when I set
My blest eyes on Amoret. *Id.*

Solomon did not deliver his observations at random, but methodised them, and set them in order, that they might appear in more strength and lustre. *Henry, Eccles. xii. 9.*

They that set light by their parents are in the highway to all wickedness. *Id. Ezek. xxii. 7.*

That fluid substance in a few minutes begins to set, as the tradesmen speak; that is, to exchange its fluidity for firmness. *Boyle.*

When I go a-hawking or setting, I think myself beholden to him that assures me, that in such a field there is a covey of partridges. *Id.*

Should we set our hearts only upon these things, and be able to taste no pleasure but what is sensual, we must be extremely miserable when we come unto the other world, because we should meet with nothing to entertain ourselves. *Tillotson.*

All that can be done is to set the thing before men, and to offer it to their choice. *Id.*

Therefore, setting aside all other considerations, I will endeavour to know the truth, and yield to that. *Id.*

Credit is gained by course of time, and seldom recovers a strain; but, if broken, is never well set again. *Temple.*

She sets the bar that causes all my pain;
One gift refused, makes all their bounty vain. *Dryden.*

The fire was formed, she sets the kettle on. *Id.*

Set calf betimes to school, and let him be instructed there in rules of husbandry. *Id.*

Over-laboured with so long a course,
'Tis time to set at ease the smoking horse. *Id.*

Jove call'd in haste

The son of Maia, with severe decree,
To kill the keeper, and to set her free. *Id.*

Set thy own songs, and sing them to thy lute. *Id.*

High on their heads, with jewels richly set,
Each lady wore a radiant coronet. *Id.*

He remembers only the name of Conon, and forgets the other, on set purpose, to shew his country swain was no greater scholar. *Id.*

Long has my soul desired this time and place,
To set before your sight your glorious race. *Id.*

With what'er gall thou sett'st thyself to write,
Thy inoffensive satires never bite. *Id.*

Cænus has betray'd

The bitter truths that our loose court upbraid:

Your friend was set upon you for a spy,
And on his witness you are doomed to die. *Id.*

Now the latter watch of wasting night,
And setting stars, to kindly rest invite. *Dryden, Æneid.*

My eyes no object meet
But distant skies that in the ocean set. *Id. Indian Emperor.*

The faithless pirate soon will set to sea,
And bear the royal virgin far away. *Dryden.*

In ten set battles have we driven back
These heathen Saxons, and regained our earth. *Id.*

That was but civil war, an equal set,
Where piles with piles, and eagles eagles fight. *Id.*

Some are reclaimed by punishment, and some are set right by good nature. *L'Estrange.*

Our hearts are so much set upon the value of the benefits received, that we never think of the bestower. *Id.*

When the father looks sour on the child, every body else should put on the same coldness, till forgiveness asked, and a reformation of his fault has set him right again, and restored him to his former credit. *Locke on Education.*

If the fear of absolute and irresistible power set it on upon the mind, the idea is likely to sink the deeper. *Locke.*

Our palates grow into a liking of the seasoning and cookery which by custom they are set to. *Id.*

No sooner is one action dispatched, which we are set upon, but another uneasiness is ready to set us on work. *Id.*

That law cannot keep men from taking more use than you set, the want of money being that alone which regulates its price, will appear, if we consider how hard it is to set a price upon unnecessary commodities; but how impossible it is to set a rate upon victuals in a time of famine. *Id.*

Set him such a task, to be done in such a time. *Id.*

He may learn to cut, polish, and set precious stones. *Id.*

'Tis raised by sets or berries, like white thorn, and lies the same time in the ground. *Mortimer's Husbandry.*

God bears a different respect to places set apart and consecrated to his worship to what he bears to places designed to common uses. *South.*

Set places and set hours are but parts of that worship we owe. *Id.*

Another set of men are the devil's setters, who continually beat their brains how to draw in some innocent unguarded heir into their hellish net, learning his humour, prying into his circumstances, and observing his weak side. *Id.*

I had one day set the hundredth psalm, and was singing the first line, in order to put the congregation into the tune. *Spectator*

Have I not set at nought my noble birth,
A spotless fame, and an unblemished race,
The peace of innocence, and pride of virtue?
My prodigality has given thee all. *Rowe's Jane Shore.*

Struck with the sight, inanimate she seems,
Set are her eyes, and motionless her limbs. *Garth.*
The Julian eagles here their wings display,
And there like setting stars the Decii lay. *Id.*

This river,
When nature's self lay ready to expire,
Quenched the dire flame that set the world on fire. *Addison.*

A couple of lovers agreed, at parting, to set aside one half hour in the day to think of each other. *Id.*

The town of Bern has handsome fountains planted, at set distances, from one end of the streets to the other. *Id.*

Minds altogether set on trade and profit often contract a certain narrowness of temper. *Id.*

I am much concerned when I see young gentlemen of fortune so wholly set upon pleasures, that they neglect all improvements in wisdom and knowledge. *Id.*

As in the subordinations of government the king is offended by any insults to an inferior magistrate, so the sovereign ruler of the universe is affronted by a breach of allegiance to those whom he has set over us. *Id.*

A spacious veil from his broad shoulders flew,
That set the unhappy Phaëton to view:
The flaming chariot and the steeds it shewed,
And the whole fable in the mantle glowed. *Id.*

If we act by several broken views, and will not only be virtuous but wealthy, popular, and every thing that has a value set upon it by the world, we shall live and die in misery. *Id.*

'Tis not a *set* of features or complexion,
The tincture of a skin, that I admire. *Id.*
W^h obliges young heirs with a *setting dog* he has
made himself. *Id.*

When his fortune *sets before him* all
The pomps and pleasures that his soul can wish,
His rigid virtue will accept of none. *Id. Cato.*

What sad disorders play begets!
Desperate and mad, at length he *sets*
Those darts, whose points make gods adore. *Prior.*

He rules the church's blest dominions,
And *sets* men's faith by his opinions. *Id.*

Against experience he believes,
He argues against demonstration;
Pleased when his reason he deceives,
And *sets* his judgment by his passion. *Id.*

Sensations and passions seem to depend upon a
particular *set* of motions. *Collier.*

Should a man go about, with never so *set* study
and design, to describe such a natural form of the
year as that which is at present establish'd, he
could scarcely ever do it in so few words that were
so fit. *Woodward.*

The body is smooth on that end, and on this it is
set with ridges round the point. *Id.*

All corpuscles of the same *set* or kind agree in
every thing. *Id.*

What we hear in conversation has this general ad-
vantage over *set* discourses, that in the latter we are
apt to attend more to the beauty and elegance of the
composure than to the matter delivered. *Rogers.*

Take *set* times of meditating on what is future.

Atterbury.
Before *set* of sun that day I hope to reach my win-
ter quarters. *Id. to Pope.*

The fracture was of both the *focils* of the left leg:
he had been in great pain from the time of the *setting*.
Wiseman.

Their first movement and impressed motions de-
mand the impulse of an almighty hand to *set* them a-
goi. *Chap.*

They refer to those critics who are partial to some
particular *set* of writers to the prejudice of others.
Pope.

Though the same sun, with all-diffusive rays,
Flush in the rose and in the diamond blaze,
We prize the stronger effort of his power,
And always *set* the gem above the flower. *Id.*

That the wheels were but small, may be guessed
from a custom they have of taking them off, and *set-
ting* them on. *Id.*

He must change his comrades;
In half the time he talks them round,
There must another *set* be found. *Swift.*

He supplies his not appearing in the present scene
of action, by *setting* his character before us, and con-
tinually forcing his patience, prudence, and valour
upon our observation. *Broom.*

Homer introduced that monstrous character to
show the marvellous, and paint it in a new *set* of
colors. *Id.*

Perhaps there is no man, nor *set* of men, upon
earth, whose sentiments I entirely follow. *Watts.*

Be frequent in *setting* such causes at work whose
effects you desire to know. *Id.*

SET, or SETS, a term used by the farmers and
gardeners to express the young plants of the
white thorn and other shrubs, with which they
use to raise their quick or quick-set hedges.
The white thorn is the best of all trees for this
purpose; and, under proper regulations, its sets
seldom fail of answering the farmer's utmost
expectations.

SET OFF, in law, is an act whereby the de-

fendant acknowledges the justice of the plaintiff's
demand on the one hand, but on the other sets
up a demand of his own, to counterbalance that
of the plaintiff, either in the whole or in part;
as, if the plaintiff sues for £10 due on a note of
hand, the defendant may set off £9 due to him-
self for merchandise sold to the plaintiff; and,
in case he pleads such set off, must pay the re-
maining balance into court. This answers very
nearly to the compensatio or stoppage of the
civil law, and depends upon the statutes 2 Geo.
II. c. 22, and 8 Geo. II. c. 24.

SETABIS, an ancient town of Spain, between
Carthage and Saguntum, near a river of the
same name. *Sil. Ital. 16, v. 474.*

SETACEOUS, *adj.* *Lat. seta.* Bristly; set
with strong hairs; consisting of strong hairs.

The parent insect, with its stiff *setaceous* tail, ter-
brates the rib of the leaf when tender, and makes
way for its egg into the very pith. *Derham.*

SETACEOUS WORM, in natural history, a name
given by Dr. Lister to that long and slender
water worm which so much resembles a horse-
hair, that it has been supposed by the vulgar to
be an animated hair of that creature. These
creatures, supposed to be living hairs, are a pe-
culiar sort of insects, which are bred and nour-
ished within the bodies of other insects, as
worms of the ichneumon flies are in the bodies
of the caterpillars. Aldrovand describes the crea-
ture, and tells us it was unknown to the ancients;
but called seta aquatica, and vermis setarius, by
the moderns, either from its figure resembling
that of a hair, or from a supposition of its once
having been the hair of some animal. We ge-
nerally suppose it, in the imaginary state of the
hair, to have belonged to a horse; but the Ger-
mans say it was once the hair of a calf, and call
it by a name signifying vitulus aquaticus, the
water calf. Albertus has declared that this ani-
mal is generated of a hair; and adds that any
hair, thrown into standing water, will in a very
little time obtain life and motion. Other authors
have dissented from this opinion, and supposed
them generated of the fibrous roots of water
plants; and others of the parts of grasshoppers
fallen into the water. This last opinion is re-
jected by Aldrovand as the most improbable of
all. Standing and foul waters are most plenti-
fully stored with them; but they are sometimes
found in the clearest and purest springs, and
sometimes out of the water, on the leaves of
trees and plants, as on the fruit trees in our gar-
dens, and the elms in hedges. They are from
three to five inches long, of the thickness of a
large hair; and are brown upon the back, and
white under the belly, and the tail white on every
part.

SE-TCHOU, a city of China of the first
rank, in the province of Koei-tchou, in a moun-
tainous country, abounding with quicksilver and
other minerals, 982 miles S. S. W. of Peking.

SE-TCHIN, or SE-TCHING, a city of China of
the first rank, in the province of Quang-si, 1100
miles S. S. W. of Peking.

SE-TCHUEN, a mountainous province on
the western frontier of China, bounded on the
north by Chen-si, on the east and south by Hou-
quang and Yunan, and on the west by Tibet.

This province is traversed from west to east by the great river Yang-tse-kiang, is highly fertile, and in a state of complete cultivation. It is particularly noted for its rhubarb, silk, sugarcane, and orange and lemon trees. The mountains produce iron, tin, lead, loadstone, and lapis lazuli. It has a breed of small but handsome and swift horses, and abounds with the animal that produces musk. Among a variety of other birds is a species of hen, with wool like that of sheep. Salt is procured, by evaporation, from wells among the mountains. The province contains ten cities of the first rank, eighty-eight of the second and third, and a great number of fortified places. Sir George Staunton states the population at 27,000,000.

SETEEE, a town of Algiers, the ancient Sitypha, the capital of this part of Mauritania. The old city is now in a state of complete ruin, presenting scarcely one fragment of the Roman walls or arts: but the fountains, which flow plentifully near the centre of the city, are still delightful. Fifty miles south-west of Constantina.

SETFOIL is a species of tormentilla.

SETH, a son of Adam, to whom he seems from the text (Gen. v. 3) to have had a very striking resemblance, both in body and mind. By some Encyclopædists, and even by the learned Dr. Watkins, he is erroneously styled the third son of Adam. It is astonishing that learned authors should pay so little attention to facts. The supposition is totally incredible; for Adam was 130 years old when Seth was born; and it is extremely improbable, that, after the divine blessing, 'increase and multiply,' Eve should have remained barren for 126 years, the shortest period we can estimate from the birth of her second son Abel. Besides it is contrary to fact; for the first murderer in his reply to his divine judge, after his sentence, expresses his fears that 'every one that findeth him should slay him' (chap. iv. 14), which clearly proves that the world was become considerably populous before the birth of Seth. By Mr. Whiston's calculation the descendants of Adam and Eve amounted at the birth of Seth to above 4000 persons. See ANTEDILUVIANS. From all that is said of the birth of Seth (Gen. iv. 25, and v. 3), we can only infer that Seth was the first son born by Eve after the murder of Abel. Had Seth been only the third son of Adam there would have been no occasion for setting a mark upon Cain, to prevent others from avenging Abel's death. Seth was the second of the antediluvian patriarchs, and the father of Enos. Chronologists place his birth in the year B. C. 3874. He lived 912 years. Some say he was a great astronomer. See ASTRONOMY, Index.

SETHIANS, in church-history, Christian heretics; so called because they paid divine worship to Seth, whom they looked upon to be Jesus Christ, the Son of God, but who was made by a third divinity, and substituted in the room of the two families of Abel and Cain, which had been destroyed by the deluge. These heretics appeared in Egypt in the second century; and, as they were addicted to all sorts of lebauchery, they did not want followers; and continued in Egypt above 200 years.

SETHITES, the descendants of Seth. See Dr. Doig's account of them under PHITTOLOGY.

SETHON, an ancient king of Egypt, who was delivered from a formidable invasion by an immense multitude of rats. See EGYPT.

SETIA, an ancient town of Italy, in Latium, above the Pontine Marshes, famous for its wines, which Augustus preferred to all other.—Pliny xiv. c. 6.

SETINES, the modern name of Athens.

SETONS, in surgery, are said to be very useful in catarrhs, inflammations, and other disorders, particularly those of the eyes, as a gutta serena, cataract, and incipient suffusion; to these we may add intense head-achs, with stupidity, drowsiness, epilepsies, and even the apoplexy itself.

SETTEE, in ship-building, a vessel very common in the Mediterranean with one deck and a very long and sharp prow. They carry some two masts, some three, without top-masts. They have generally two masts, equipped with triangular sails, commonly called lateen sails. The least of them are of sixty tons burden. They serve to transport cannon and provisions for ships of war and the like. These vessels are peculiar to the Mediterranean Sea, and are usually navigated by Italians, Greeks, or Mahometans.

SETTING, in the sea-language. To set the land or the sun by the compass is to observe how the land bears on any point of the compass, or on what point of the compass the sun is. Also, when two ships sail in sight of one another, to mark on what point the chased bears, is termed setting the chase by the compass.

SETTING, among sportsmen, a term used to express the manner of taking partridges by means of a dog peculiarly trained to that purpose. See SHOOTING.

SETTLE, *n. s.* Saxon, *setol*. A seat; a bench; something to sit on.

From the bottom to the lower settle shall be two cubits. *Ezek. xliii.*

The man, their hearty welcome first exprest,

A common settle drew for either guest,

Inviting each his weary limbs to rest. *Dryden.*

SETTLE, *v. a. & v. n.* Sax. *setol*. Prob-

ably, as Dr. Johnson suggests, from the

noun substantive above, or a frequentative of set. To fix; confirm; establish; compose; applied, both literally and metaphorically: as a verb neuter, to fix one's self; to subside; become fixed; repose; grow calm; fix a contract: settledness means the state of being settled: settlement the act or place of settling, or arrangement made; residence.

I will settle you after your old estates, and will do better unto you than at your beginnings. *Ezek. xxxvi.*

Till the fury of his highness settle,

Come not before him. *Shakspeare. Winter's Tale.*

The wind came about and settled in the west, so as we could make no way. *Bacon.*

So do the winds and thunders cleanse the air, So working seas settle and purge the wine. *Davies.*

What one party thought to rivet to a settledness by the strength and influence of the Scots, that the other rejects and contemns. *King Charles.*

When thou art *settling* thyself to thy devotions,
 imagine thou hearest thy Saviour calling to thee as
 he did to Martha, Why art thou so careful? *Duppa.*

In hope to find
 Better abode, and my afflicted powers
 To *settle* here.

Milton.

Settled in his face I see
 Sad resolution.

Id.

That country became a gained ground by the
 mud brought down by the Nilus, which *settled* by
 degrees into a firm land. *Browne's Vulgar Errors.*

Exalt your passion by directing and *settling* upon
 an object, the due contemplation of whose loveliness
 may cure perfectly all hurts received from mortal
 beauty. *Boyle.*

Every man living has a design in his head upon
 wealth, power, or *settlement* in the world.

L'Estrange.

My flocks, my fields, my woods, my pastures take,
 With *settlement* as good as law can make. *Dryden.*

Your fury then boiled upward to a foam;
 But, since this message came, you sink and *settle*.
 As if cold water had been poured upon you. *Id.*

His banished gods restored to rites divine,
 And *settled* sure succession in his line. *Id. Æneid.*

This exactness will be troublesome, and therefore
 men will think they may be excused from *settling* the
 complex ideas of mixed modes so precisely in their
 minds. *Locke.*

This, by a *settled* habit in things whereof we have
 frequent experience, is performed so quick that we
 take that for the perception of our sensation which is
 an idea formed by our judgment. *Id.*

One part being moist and the other dry occasions
 its *settling* more in one place than another, which
 causes cracks and *settling*s in the wall.

Mortimer's Husbandry.

Cover ant-hills up, that the rain may *settle* the
 turf before the spring. *Id.*

Fullers' earth left a thick *settlement*. *Id.*

According to laws established by the divine wis-
 dom, it was wrought by degrees from one form into
 another, till it *settled* at length into an habitable
 earth. *Burnet.*

When time hath worn out their natural vanity, and
 taught them discretion, their fondness *settles* on its
 proper object. *Spectator.*

Medals give a very great light to history, confirm-
 ing such passages as are true in old authors and *set-*
tling such as are told after different manners.

Addison.

He sighs with most success that *settles* well. *Garth.*

SETTLE, Elkanah, an English poet, was born
 in 1648. At the age of eighteen, he entered at
 Oxford, but quitted the university without taking
 a degree, and, going to London, commenced
 author by profession. He wrote numerous politi-
 cal pamphlets, and, in reply to Dryden's poem
 entitled the Medal, occasioned by the whig
 party striking a medal to commemorate the
 throwing out of the bill against the earl of
 Shaftesbury, a piece called the Medal Reversed;
 and, soon after, a poem entitled Azaria and
 Hushai, designed as an answer to the Absalom
 and Achitophel. In 1685, he published a poem
 on the coronation of James II., and, about the
 same time, obtained a pension from the city, for
 writing an annual inauguration panegyric on
 lord mayor's day. Settle was, besides, an inde-
 fatigable writer for the stage, and produced fif-
 teen dramatic pieces, none of which are now
 known on the boards. In the decline of life,
 he received a salary from the proprietor of a

booth at Bartholomew fair, as a writer of
 "Drolls," which were generally very successful,
 and is said to have been, at that time, the best
 contriver of theatrical machinery in the kingdom.
 He died at the Charter-house, in 1724.

SETTLE, a market-town in the West Riding of
 Yorkshire, situate on the river Ribble, among
 the hills which separate the counties of York
 and Lancaster, sixty miles west by north from
 York, and 233 north-west by north from Lon-
 don. The town is irregularly built, at the base
 of a limestone rock which rises 300 feet above
 the level of the town, and the parish church is at
 Giggleswick, on the opposite side of the river,
 over which there is a stone bridge. The cotton
 mills here and in the vicinity employ a great
 number of the inhabitants. The market-place is
 spacious, and the market on Tuesday is well
 attended; there is also a good market for cattle
 every fortnight. Fairs, Thursday before Good-
 Friday for cattle; three fairs every other Friday
 thence till Whitsuntide, also for cattle; April
 26th for sheep; Whit-Tuesday for woollen-cloth
 and pedlary; August 19th for leather and cattle;
 August 20th for sheep and wool; the day fol-
 lowing for woollen cloth and pedlary, and the
 first Tuesday after October 27th for cattle. In
 the neighbourhood are several vestiges of Ro-
 man fortifications, and on the top of an adjacent
 moor is Malham Tarn, a lake abounding with
 trout. Near the town is a curious ebbing and
 flowing well; a square reservoir of stone, four
 feet by three, is placed over it, and in this trough
 the water rises and falls about a foot in ten or
 fifteen minutes.

SETTLEMENT, ACT OF, in British history, a
 name given to the statutes 12 and 13 W. III.
 c. 2., whereby the crown was limited to his
 present majesty's illustrious house; and some
 new provisions were added, at the same fortunate
 era, for better securing our religion, laws, and
 liberties; which the statute declares to be the
 birthright of the people of England, according to
 the ancient doctrine of the common law.

SETUAN, a province of China, bounded on
 the north by Chansi, east by Koei-tcheou and
 Yunnan, and west by Thibet. It is watered by
 the Yang-tse-kiang; and its divisions, produc-
 tions, animals, minerals, &c., being the same
 with those of Se-tchuen, we suppose they are one
 and the same. They are both represented as far
 from the sea-coast. Setuan abounds with stags,
 deer, partridges, parrots, &c., and a peculiar
 species of fowls which are covered with wool
 instead of feathers.

SETUBAL, or ST. UBES, a large town of
 Portugal, at the mouth of the river Sado, sixteen
 miles S. S. E. of Lisbon. In the earthquake of
 1755 it was almost entirely levelled, but soon re-
 built in a much better style, and the whole forti-
 fied with a mound, a citadel called San Felipe,
 &c. The streets are now paved, and the harbour
 and the quays broad and spacious. It contains
 five churches, eleven monasteries, a hospital and
 arsenal. Its trade is active in the export of
 lemons, olives, oil, wine (particularly a species
 of muscadell), and, above all, in bay salt, of
 which no less than 200,000 tons are made an-
 nually. Population 12,000.

SEVASTOPOL, a town of European Russia, in the Crimea, on a bay of the Euxine. This was one of the chief mercantile towns of the ancient Colchis: in modern times it has been known only as a petty Tartar village, called Achtiar, which has been erected into a town by Russia. Its increase has since been rapid; it has several good hospitals, docks and dock-yards, barracks, an arsenal, a lazaretto, a large market-place, &c. The harbour is excellent, and is the station of part of the Russian fleet. The principal bay runs up between four and five miles into the land, is perfectly sheltered, and without a single shoal. Inhabitants 3000. Forty-two miles south of Eupatoria, and forty-two south-west of Simferopol.

A *seventnight's* speed. *Id. Othello.*

Worthy Marcius,
Had we no quarrel else to Rome, but that
Thou art thence banished, we would muster all,
From twelve to *seventy*. *Id. Coriolanus.*

'Upon this dreadful beast with *sevenfold* head
He set the false Duessa, for more awe and dread.
Faerie Queene.

Pharmis, king of the Medes, it is said, he over-
threw and cruelly murdered, with his *seven* children. *Raleigh.*

Shining woods, laid in a dry room, within a *seven-*
night lost their shining. *Bacon's Natural History.*

The old countess of Desmond, who lived till she
was *sevenscore* years old, did dentize twice or thrice;
casting her old teeth, and others coming in their
place. *Bacon.*

The child born in the *seventh* month doth com-
monly well. *Id.*

Seventhly, living bodies have sense, which plants
have not. *Id.*

Not for that silly old morality,
That, as these links were knit, our loves should be,
Mourn I, that I thy *sevenfold* chain have lost,
Nor for the luck's sake, but the bitter cost. *Donne.*

We call not that death immature, if a man lives
still *seventy*. *Taylor.*

What if the breath that kindled those grim fires,
Awaked, should blow them into *sevenfold* rage. *Milton.*

Wrath meet thy flight *sevenfold*. *Id.*

The conquest of Ireland was perfected by the
king in the *seventeenth* year of his reign. *Judge Hale.*

So Pharaoh, or some greater king than he,
Provided for the *seventh* necessity:

Taught from above his magazines to frame;
That famine was prevented ere it came. *Dryden.*

The weight of *seventy* winters prest him down,
He bent beneath the burthen of a crown. *Id.*

Fair queen,
Who swayest the sceptre of the Pharian isle,
And *sevenfold* falls of disemboing Nile. *Id.*

In the Hebrew there is a particle consisting but
of one single letter, of which there are reckoned up
seventy several significations. *Locke.*

This comes from one of those untuckered ladies,
whom you were so sharp upon on Monday was
se'n night. *Addison.*

SEVENOAKS, a town of England, in Kent, so named from seven large oaks, near which it was built, twenty-three miles and a half south-east from London. The town is well built, and consists chiefly of two wide streets, in one of which stands the ancient market-house in which the petty sessions for the lathe of Sutton-at-Hone are held. The church is a conspicuous object for many miles round the country. The town is governed by a warden, a bailiff, and four assistants. In it is a good free grammar-school, and an alms-house for thirty-two aged people, erected by Sir William Sevenoaks, who was a deserted child and was found in Seven-Oaks, and afterwards became lord mayor of London. At the end of the town is Knowle Park, the seat of the duke of Dorset. The building is quadrangular, and is a noble pile of architecture, covering, with its adjacent buildings, above five acres of land. The whole of the galleries and chambers are furnished with pictures, which are the best performances of most of the celebrated masters. Market on Saturday. Fairs, July 10th, and October 12th. The rectory is valued at £13 6s. 8d., and the vicarage at £15 3s. 1d.

SEVENOAKS (Sir William), a fortunate found-
ling, born and exposed in the above town in the latter part of the fourteenth century. Having the good fortune to be taken care of, and educated by a benevolent citizen, whose name is not recorded, though it deserves to be eternized, he rose by his industry and merit to be lord mayor of London, and to be knighted, in 1418. In gratitude for the attention bestowed on his help-
less infancy in the above town, he built a hospi-
tal in it for aged people, with a free school for children. Queen Elizabeth augmented its reve-
nues, and it was rebuilt in 1727.

SEVER, *v. a. & v. n.*) Fr. *sevrer*; barb.
SEVERAL, *adj. & n. s.*) Lat. *severo*, of Lat.
SEVERALLY, *adv.*) *separo*. To divide;
SEVERALTY, *n. s.*) part by violence;
SEVERANCE.) force asunder; sepa-
rate; disjoin; keep apart or distinct: make a
separation; suffer a separation: hence several
means distinct; differently from another; divers;
particular; single; appropriate: the adverb
corresponding: severalty is state of separation:
severance, the act of separating; partition.

The angels shall *sever* the wicked from among the
just. *Matthew.*

*More profit is quieter found
Where pastures in several be,
Of one silly aker of ground
Than champion maketh of three.*

Tusser's Husbandry.

They are not so far disjoined and severed, but that they come at length to meet. *Hooker.*

They had their *several* for heathen nations, their *several* for the people of their own nation, their *several* for men, their *several* for women, their *several* for their priests, and for the high priest alone their *several*. *Id.*

Consider angels each of them *severally* in himself, and their law is, All ye his angels praise him. *Id.*

This by some *severals*

Of headpiece extraordinary, lower messes
Perchance are to this business purblind. *Shakespeare.*

There was not time enough to hear

The *severals*. *Id.*

Our force by land
Hath nobly held; our severed navy too
Have knit again, and float.

Shakespeare. Antony and Cleopatra.

This axiom is of large extent, and would be severed and refined by trial. *Bacon.*

There was a nobleman that was lean of visage, but immediately after his marriage he grew pretty plump and fat. One said to him, Your lordship doth contrary to other married men; for they at first wax lean, and you wax fat. Sir Walter Raleigh stood by and said, There is no beast, that if you take him from the common, and put him into the *several*, but will wax fat. *Id.*

The jointure or advancement of the lady was the third part of the principality of Wales, the dukedom of Cornwall, and the earldom of Chester, to be set forth in *severalty*. *Id.*

The conquest of Ireland was made piece and piece, by *several* attempts, in *several* ages.

Davies's History of Ireland.

Having considered the apertions in *severalty*, according to their particular requisites, I am now come to the casting and contexture of the whole work.

Wotton.

Those rivers inclose a neck of land, in regard of its fruitfulness not unworthy of a *severance*.

Carew's Survey of Cornwall.

This country is large, having in it many people, and *several* kingdoms.

Abb't's Description of the World.

That will appear to be a methodical successive observation of these *severals*, as degrees and steps preparative the one to the other.

Hammond's Fundamentals.

The night came and severed them, all parties being tired with the duty of the day. *Clarendon.*

What thou art is mine:

Our state cannot be severed, we are one,
One flesh; to lose thee were to lose myself. *Milton.*

This else to *several* spheres thou must ascribe. *Id.*

Four *several* armies to the field are led,
Which high in equal hopes four princes head.

Dryden.

He, with his guide, the farther fields attained;
Where, severed from the rest, the warrior souls remained. *Id.*

The apostles could not be confin'd
To these or those, but *severally* design'd
Their large commission round the world to blow. *Id.*

Several of them neither arose from any conspicuous family, nor left any behind them.

Addison's Freeholder.

Others were so very small and close together, that

I could not keep my eye steady on them *severally*, so as to number them. *Newton's Opticks.*

Forgetful queen, who severed that bright head,
Which charmed two mighty monarchs to her bed.

Granville.

Each might his *sev'ral* province well command,
Would all but stoop to what they understand. *Pope.*

SEVER (St.), a considerable town of France, the chief place of an arrondissement in the department of the Landes. It is not a seaport, but stands on the Adour, has 9000 inhabitants, and carries on a considerable trade in wine and brandy. Twenty-four miles east of Dax, and seventy-three south by east of Bourdeaux. Also a small town of France, in Normandy, department of Calvados, near the forest of St. Sever. Population 1500. Six miles west of Vire, and thirty-one south-west of Caen.

SEVERANCE, in law, is the singling or severing two or more that join or are joined in the same writ or action. As if two join in a writ, de libertate probanda, and the one be afterwards nonsuited; here severance is permitted, so as, notwithstanding the nonsuit of the one, the other may severally proceed. There is also severance of the tenants in assize, when one, two, or more disseises appear upon the writ, and not the other. And severance in debt, where two executors are named plaintiffs, and the one refuses to prosecute. We also meet with severance of summons, severance in attainds, &c. An estate in joint-tenancy may be severed and destroyed by destroying any of its unities. 1. That of time, which respects only the original commencement of the joint estate, cannot indeed, being now part, be affected by any subsequent transaction. But, 2. The joint tenants' estate may be destroyed without any alienation, by merely disuniting their possession. 3. The jointure may be destroyed, by destroying the unity of title. And, 4. By destroying the unity of interest.

SEVERE, *adj.* } Fr. *severe*; Lat. *severus*.

SEVERELY, *adv.* } Sharp; rigorous; hard; ri-

SEVERITY, *n. s.* } gid; not lax: hence censorious; austere; grave; sober; sedate: the adverb and noun substantive corresponding.

I laugh to see your ladyship so fond,
To think that you have aught but Talbot's shadow
Whereon to practise your severity. *Shakespeare.*

Never were so great rebellions expiated with so little blood; as for the severity used upon those taken in Kent, it was but upon a scum of people.

Bacon.

Let your zeal, if it must be expressed in anger, be always more severe against thyself than against others. *Taylor.*

Soon moved with touch of blame, thus Eve:
What words have passed thy lips, Adam severe?

Milton.

Truth, wisdom, sanctitude, severe and pure,
Severe, but in true filial freedom placed. *Id.*

These piercing fires are soft, as now severe. *Id.*

Though nature hath given insects sagacity to avoid the winter cold, yet its severity finds them out.

Hale's Origin of Mankind.

Your looks must alter, as your subject does,
From kind to fierce, from wanton to severe. *Wallr.*
Their beauty I leave it rather to the delicate wit of poets, than venture upon so nice a subject with my severer style. *Morr.*

What made the church of Alexandria be so severe

with Origen for, but holding the incense in his hands, which those about him cast from thence upon the altar? yet for this he was cast out of the church.

Stillfleet.

The Latin, a most *severe* and compendious language, often expresses that in one word, which modern tongues cannot in more. *Dryden.*

More formidable Hydra stands within;
Whose jaws with iron teeth *severely* grin *Id.*

Confining myself to the *severity* of truth, becoming, I must pass over many instances of your military skill. *Id.*

If a man would have his conscience deal clearly with him, he must deal *severely* with that.

South's Sermons.

To be or fondly or *severely* kind. *Savage.*

There is a difference between an ecclesiastical censure and *severity*: for under a censure we only include excommunication, suspension, and an interdiction; but under an ecclesiastical *severity* every other punishment of the church is intended; but, according to some, a censure and a *severity* are the same. *Ayliffe.*

Nor blame *severe* his choice,
Warbling the Grecian woes. *Pope's Odyssey.*

Taught by thy practice steadily to steer
From grave to gay, from lively to *severe*. *Pope.*

We have wasted our strength to attain ends different from those for which we undertook the war; and often to effect others, which after a peace we may *severely* repent. *Swift.*

SEVERINA (St.), a considerable town in the south part of Naples, in Calabria Ultra, situated on a rocky eminence near the Neto. It is the see of an archbishop, and contains 6000 inhabitants. Eighteen miles south of Cosenza, and ninety-three north-east of Reggio.

SEVERN, a river of England and Wales, which rises in the mountain of Plynlimmon, in Montgomery and Cardiganshires; and flows, first, across the south side of Montgomeryshire, then, turning northward, enters Salop, above the Brythen Hills, at its confluence with the Wirnew. In its course it flows by Welshpool, Shrewsbury, Bridgnorth, Worcester, Tewksbury, and Gloucester, and, entering the sea, its mouth, at its confluence with the Avon, ten miles below Bristol, is called the Bristol Channel. This river, by means of its numerous canals, extends its navigation to all the principal trading districts of the kingdom, being united with the Thames on the east, and with the Trent, Mersey, and Humber, on the north.

SEVERUS (Alexander), an excellent Roman emperor. See ALEXANDER SEVERUS, and ROME.

SEVERUS (Lucius Cornelius), an ancient Latin poet of the Augustan age; whose *Ætina*, together with a fragment *De morte Ciceronis*, were published, with notes and a prose interpretation, by Le Clerc, 12mo., Amsterdam, 1703. They were before inserted among the *Catalecta Virgilii* published by Scaliger; whose notes, with others, Le Clerc has received among his own.

SEVERUS I. (Lucius Septimius), a Roman emperor, who has been so much admired for his military talents that some have called him the most warlike of the Roman emperors. As a monarch he was cruel; and it has been observed that he never performed an act of humanity, or forgave a fault. In his diet he was temperate; and he always showed himself an open enemy

to pomp and splendor. He loved the appellation of a man of letters, and he even composed a History of his own reign, which some have praised for its correctness and veracity. However cruel Severus may appear in his punishments and in his revenge, many have endeavoured to exculpate him, and observed that there was need of severity in an empire where the morals were so corrupted, and where no fewer than 3000 persons were accused of adultery during the space of seventeen years. Of him, as of Augustus, some say that it would have been better for the world he had never been born, or had never died. See ROME.

SEVERUS II. (Flavius Valerius), a short-lived emperor, who was raised to the purple by Galerius; but, being deserted by his soldiers when ready to engage Maxentius, he killed himself, A. D. 307. See ROME.

SEVERUS III., called also Olybius, another short-lived emperor, who was saluted Augustus at Ocavenna, on the death of Majorianus and Anthemius; and his election was approved by the senate; but he was soon after poisoned, A. D. 461. See ROME.

SEVERUS, in church history, a sectary of the second century, a follower of Tatian, and chief of the sect of the Severians. He flourished about A. D. 178.

SEVERUS (Sulpicius), a historian who flourished in the beginning of the fifth century, and by his writing acquired the title of the Christian Sallust. He was born at Aquitain, entered into orders, and built a church at Primuliacum. His principal work is *Sacred History*, which reaches from the Creation to A. D. 400.

SEVERUS'S WALL, in British topography, the fourth and last barrier erected by the Romans against the incursions of the North Britons. See ADRIAN and ANTONINUS'S WALLS. We learn from the Roman historians that the country between the walls of Adrian and Antoninus continued to be a scene of perpetual war and subject of contention between the Romans and Britons, from the beginning of the reign of Commodus to the arrival of the emperor Septimius Severus in Britain, A. D. 206. This last emperor, having subdued the Maëta and repulsed the Caledonians, determined to erect a stronger and more impenetrable barrier than any of the former against their future incursions. Though neither Dio nor Herodian makes any mention of a wall built by Severus in Britain for the protection of the Roman province, yet we have abundant evidence from other writers of equal authority that he really built such a wall. 'He fortified Britain,' says Spartian, 'with a wall drawn cross the island from sea to sea; which is the greatest glory of his reign. After the wall was finished, he retired to the next station, York, not only a conqueror, but the founder of an eternal peace.'

To the same purpose Aurelius Victor and Orosius, to say nothing of Eutropius and Cassiodorus: 'Having repelled the enemy in Britain, he fortified the country, which was suited to that purpose, with a wall drawn cross the island from sea to sea.' 'Severus drew a great ditch, and built a strong wall, fortified with several turrets, from sea to sea, to protect that part of the island

which he had recovered from the yet unconquered nations.' As the residence of the emperor Severus in Britain was not quite four years, it is probable that the two last of them were employed in building this wall; according to which account, it was begun A. D. 209, and finished A. D. 210. This wall of Severus was built nearly on the same tract with Adrian's rampart, at the distance only of a few paces north. The length of this wall, from Cousin's House, near the mouth of the Tyne on the east, to Boulness on the Solway Frith on the west, hath been found, from two actual mensurations, to be a little more than sixty-eight English miles, and a little less than seventy-four Roman miles. To the north of the wall was a broad and deep ditch, the original dimensions of which cannot now be ascertained, only it seems to have been larger than that of Adrian. The wall itself, which stood on the south brink of the ditch, was built of free-stone; and, where the foundation was not good, it is built on piles of oak: the interstice between the two faces of this wall is filled with broad thin stones, placed not perpendicularly, but obliquely, on their edges; the running mortar or cement was then poured upon them, which, by its great strength and tenacity, bound the whole together, and made it firm as a rock. But, though these materials are sufficiently known, it is not easy to guess where they were procured; for many parts of the wall are at a great distance from any quarry of free-stone, and, though stone of another kind was within reach, yet it does not appear to have been any where used. The height of this wall was twelve feet besides the parapet, and its breadth eight feet, according to Bede, who lived only at a small distance from the east end of it, and in whose time it was almost quite entire in many places. Such was the wall erected by the command and under the direction of the emperor Severus in the north of England; and considering the length, breadth, height, and solidity, it was certainly a work of great magnificence, and prodigious labor. But the wall itself was but a part, and not the most extraordinary part, of this work. The great number and different kinds of fortresses which were built along the line of it for its defence, and the military ways with which it was attended, are still more worthy of our admiration, and come now to be described. The fortresses which were erected along the line of Severus's wall for its defence were of three different kinds, and three different degrees of strength; and were called by three different Latin words, which may be translated stations, castles, and turrets. Of each of these in their order. The stations, stations, were so called from their stability and the stated residence of garrisons. They were also called castra, which has been converted into chesters, a name which many of them still bear. These were by far the largest, strongest, and most magnificent of the fortresses which were built upon the wall, and were designed for the head-quarters of the cohorts of troops which were placed there in garrison, and thence detachments were sent into the adjoining castles and turrets. These stations, as appears from the vestiges of them which are still visible, were not all exactly of the same figure nor of the same

dimensions; some of them being exactly squares, and others oblong, and some of them a little larger than others. These variations were no doubt occasioned by the difference of situation and other circumstances. The stations were fortified with deep ditches and strong walls: the wall itself coinciding with and forming the north wall of each station. Within the stations were lodgings for the officers and soldiers in garrison; the smallest of them being sufficient to contain a cohort, or 600 men. Without the walls of each station was a town, inhabited by laborers, artificers, and others, both Romans and Britons, who chose to dwell under the protection of these fortresses. The number of the stations upon the wall was exactly eighteen; and, if they had been placed at equal distances, the interval between every two of them would have been four miles and a few paces: but the intervention of rivers, marshes, and mountains; the convenience of situations for strength, prospect, and water; and many other circumstances to us unknown, determined them to place these stations at unequal distances. The situation which was always chosen by the Romans, both here and every where else in Britain where they could obtain it, was the gentle declivity of a hill, near a river, and facing the meridian sun. Such was the situation of the far greatest part of the stations on this wall. In general the stations stood thickest near the two ends and in the middle, probably because the danger of invasion was greatest in these places. But the reader will form a clearer idea of the number of these stations, their Latin and English names, their situation and distance from one another, by inspecting the following table, than we can give him with equal brevity in any other way. The first column contains the number of the station, reckoning from east to west; the second contains its Latin, and the third its English name; and the last three its distance from the next station to the west of it, in miles, furlongs, and chains.

No.	Latin name.	English name.	M. F. C.
1	Segedunum	Cousins'-house	3 5 1½
2	Pons Ælii	Newcastle	2 0 9
3	Condercum	Benwell hill	6 6 5
4	Vindobala	Rutchester	7 0 3½
5	Hunnum	Haston-chesters	5 1 7
6	Cilurnum	Walwick-chesters	3 1 8
7	Procolitia	Carrawburgh	4 5 3½
8	Borcovicus	Housesteads	1 3 8
9	Vindolana	Little Chesters	3 6 4
10	Ælica	Great Chesters	2 1 6½
11	Magna	Carryoran	2 6 0

13	Petrianæ	Cambeck	2 6 6
14	Aballaba	Watchcross	5 1 9
15	Congavata	Stanwix	3 3 4
16	Axelodunum	Brugh	4 0 9
17	Gabrosentum	Brumbrugh	3 4 1
18	Tinnocelum	Boulness	0 0 0
Length of the wall			68 3 3

The castella, or castles, were the second kind of fortifications, which were built along the side of this wall for its defence. These castles were neither so large nor strong as the stations, but much more numerous, being no fewer than eighty-one. The shape and dimensions of the castles, as appears from the foundations of many of them which are still visible, were exact squares of sixty-six feet every way. They were fortified on every side with thick and lofty walls, but without any ditch, except on the north side; on which the wall itself, raised much above its usual height, with the ditch attending it, formed the fortification. The castles were situated in the intervals between the stations, at the distance of about seven furlongs from each other; though particular circumstances sometimes occasioned a little variation. In these castles guards were constantly kept by a competent number of men detached from the nearest stations. The turrets, or turrets, were the third and last kind of fortifications on the wall. These were still much smaller than the castles, and formed only a square of about twelve feet, standing out of the wall on its south side. Being so small they are more entirely ruined than the stations and castles, which makes it difficult to discover their exact number. They stood in the intervals between the castles; and from the faint vestiges of a few of them it is conjectured that there were four of them between every two castles, at the distance of about 300 yards from one another. According to this conjecture the number of the turrets amounted to 324. They were designed for watch-towers and places for sentinels, who, being within hearing of one another, could convey an alarm or piece of intelligence to all parts of the wall in a very short time. In these stations, castles, and turrets, a very considerable body of troops was constantly quartered for its defence. The usual complement allowed for this service was as follows:—

1. Twelve cohorts of foot, consisting of 600 men each	7,200
2. One cohort of mariners in the station at Boulness	600
3. One detachment of Moors, probably equal to a cohort	600
4. Four ala or wings of horse, consisting, at the lowest computation, of 400 each	1,600
	10,000

For the conveniency of marching these troops from one part of the wall to another, with the greater ease and expedition, on any service, it was attended with two military ways, paved with square stones in the most solid and beautiful manner. One of these ways was smaller, and the other larger. The smaller military way ran close along the south side of the wall, from turret to turret, and castle to castle. The larger way did not keep so near the wall, nor touch at the turrets or castles, but pursued the most direct course, and was designed for marching larger bodies of troops. There have been discovered, in or near the ruins of this wall, a great number of small square stones, with very short and gene-

rally imperfect inscriptions upon them; mentioning particular legions, cohorts, and centuries. Of these the reader may see no fewer than twenty-nine among the Northumberland and Cumberland inscriptions in Mr. Horsley's *Britannia Romana*. It is highly probable that they have been originally placed in the face of the wall. From the uniformity of these inscriptions they were all intended to intimate that the adjacent wall was built by the troops mentioned in them. This great work was executed by the second and sixth legions, these being the only legions mentioned in these inscriptions. Now if this prodigious wall, with all its appendages of ditches, stations, castles, turrets, and military ways, was executed in the space of two years by two legions only, which, when most complete, made no more than 1200 men, how greatly must we admire the skill, the industry, and discipline of the Roman soldiers, who were not only the valiant guardians of the empire in times of war, but its most active and useful members in times of peace! This wall of Severus, and its fortresses, proved an impenetrable barrier to the Roman territories for nearly 200 years. But about the beginning of the fifth century, the Roman empire being assaulted on all sides and the bulk of their forces withdrawn from Britain, the Mætae and Caledonians, now called Scots and Picts, became more daring; and some of them breaking through the wall, and others sailing round the ends of it, they carried their ravages into the very heart of Provincial Britain. These invaders were indeed several times repulsed after this by the Roman legions sent to the relief of the Britons. The last of these legions, under Gallio of Ravenna, having, with the assistance of the Britons, thoroughly repaired the breaches of Severus's wall and its fortresses, and exhorted the Britons to make a brave defence, took their final farewell of Britain. It soon appeared that the strongest walls and ramparts are no security to an undisciplined rabble, as the unhappy Britons then were. The Scots and Picts met with little resistance in breaking through the wall, while the towns and castles were tamely abandoned to their destructive rage. In many places they levelled it with the ground, that it might prove no obstruction to their future inroads. From this time no attempts were ever made to repair this noble work. Its beauty and grandeur procured it no respect in the dark and tasteless ages which succeeded. It became the common quarry for more than 1000 years, out of which all the towns and villages around were built; and it is now so entirely ruined that the penetrating eyes of the most poring and patient antiquarian can hardly trace its vanishing foundation.

SEVIGNE' (Mary de Rabutin, marchioness of), a French lady, born in 1626. When only a year old she lost her father, who was killed in the descent of the English on the isle of Rhé, where he commanded a company of volunteers. In 1644 she married the marquis of Sevigné, who was slain in a duel by the chevalier d'Albert in 1651. She had by him a son and a daughter, to the education of whom she afterwards devoted her whole attention. Her daughter was married in 1669 to the count of Grignan,

who conducted her to Provence. Madame de Sevigné consoled herself by writing frequent letters to her daughter. She fell at last the victim to her maternal tenderness. In one of her visits to Grignan she fatigued herself so much during the sickness of her daughter that she was seized with a fever, which carried her off on the 14th of January 1696. The *Compte de Bussi* describes her as a lively gay coquette, a lover of flattery, fond of titles, honors, and distinction: M. de la Fayette as a woman of wit and good sense, as possessed of a noble soul, formed for dispensing benefits, incapable of debasing herself by avarice, and blessed with a generous, obliging, and faithful heart. Both these portraits are in some measure just. That she was vain-glorious appears from her own letters, which also exhibit undoubted proofs of her virtue and goodness of heart. She was acquainted with all the wits of her age. She decided the famous dispute between Perrault and Boileau concerning the preference of the ancients to the moderns, thus, 'The ancients are the finest, and we are the priest.' She left behind her a most valuable collection of letters, the best edition of which is that of 1775, in 8 vols. 12mo. 'These letters,' says Voltaire, 'are filled with anecdotes, written with freedom, and in a natural and animated style; are an excellent criticism upon studied letters of wit, and still more upon those fictitious letters which aim at the epistolary style, by a recital of false sentiments and feigned adventures to an imaginary correspondent.' What makes them in general so interesting is that they are in part historical. They are a record of the manners, the ton, the genius, the fashions, the etiquette, which reigned in the court of Louis XIV. They contain many curious anecdotes no where else to be found. A volume entitled *Sevigniana* was published at Paris in 1756, which is a collection of the fine sentiments, literary and historical anecdotes, and moral apophthegms, scattered throughout these letters.

SEVILLE, a beautiful province of Spain, forming the western half of Andalusia, and still retaining the title of kingdom. Its form, though irregular, is compact, containing an area of 9500 square miles. The ecclesiastical division is into two dioceses; the civil into ten districts. The chief towns are:—

	Inhabitants.
Seville, the capital	100,000
Cadiz	70,000
Ecija	28,000
Xeres	20,000
Ossuna	15,000
St. Mary's, near Cadiz . . .	12,000
Population of the entire province	750,000

This province is diversified with beautiful plains, and hills covered in the south with vines and the finest fruit trees. The principal mountain chains are the Sierra Morena, the Sierra de Ronda, the Sierra de Constantina; but none are of great elevation. They are intersected in some parts by ravines, in others by fertile valleys. The chief rivers are the Guadalquivir, the Guadiana, the Xenil, the Tinto, and the Odiel. The climate is warm, but the extremes are tempered

by cool breezes from the sea or from the mountains: the solano or hot African wind, though not so prevalent as in other provinces, is at times scorching, and blights the crop on the ground in a few hours. The chief hazards to the labors of the husbandman arise from drought. The winter may be compared to a mild spring in the south of England.

The basis of most of the mountains is limestone or marble; and mines of gold and silver are said to have been formerly wrought. The soil differs greatly according to situation, being in some places very stony and unproductive, in others a fine black mould. Agriculture is extremely backward. The pasturage is good in those situations where either the frequency of rain, the height of the fields, or the use of irrigation, protects it from intense heat: the climate is very favorable to vines, and the environs of Xeres produce the well known sherry wine; those of Rota, tint wine (*vino tinto*); of St. Lucar, the *manicillo*. Large tracts in the southern districts are covered with oranges, lemons, citrons, and limes; but other tracts of equal extent are almost desolate; and this in a great measure from the old provincial laws and usages confining the culture of oil and wine to certain families. The price of oxen is generally moderate, but the town dues on butcher's meat at Seville make it cost as much as in London. The chief export is bay salt, prepared and shipped from Cadiz.

The silk manufacture of the province is chiefly conducted in the capital: in other parts there are also manufactures on a small scale of coarse woollen, linen, leather, soap, pottery, and hats, all for home consumption. The export trade is carried on at Cadiz, and consists chiefly in the article of wine sent to England, and of miscellaneous articles to America. The chief sea-port in the south is Algesiras.

To the bad government, and the other drawbacks of Spain in general, this province has to add causes of peculiar suffering; the disturbances since 1810 in the colonies with which its trade is carried on; and the repeated occurrence of pestilential disease in Cadiz and the neighbourhood.

SEVILLE, a large city of Spain, in Andalusia, the capital of the province of this name, stands in a fine plain on the left bank of the Guadalquivir, surrounded by an old wall of considerable height, having twelve gates, and 166 turrets. Its circuit is between five and six miles. The population is commonly stated at 100,000. The streets are in the Moorish style, being often so narrow that a person can touch the houses on either side by extending his arms. This mode of building was said to be adopted for the sake of coolness, and to prevent the rays of the sun from penetrating. The streets are in general badly paved; but most of them have a fountain in the centre: as the water however is seldom cool, the inhabitants are largely supplied from stalls, in different parts of the town, for the sale of filtered water. There are here several beautiful public walks; one in particular on the bank of the Guadalquivir. The suburbs are tolerably built.

The houses of Seville cover a large space, there being in the middle of each a court with a fountain. On the side towards the streets they have often a mean appearance. There are no fewer than thirty churches, eighty-four convents, and twenty-four hospitals, great and small. The cathedral is a large and magnificent Gothic pile, built in the fifteenth century, and containing eighty-two altars. Its tower, 250 feet in height, is reckoned the finest in Spain. Of the other churches and convents the chief attraction consists in their paintings. A convent called *De Buenavista*, situated on the opposite side of the *Guadalquivir*, is remarkable for its extensive prospect, which takes in the mountains of *Ronda* at a distance of seventy miles to the east, and the *Sierra Morena* at nearly the same distance north-west.

The other most conspicuous public buildings are the *Alcazar* or palace, the *Lonja* or exchange, the artillery school, and the mint. The *Alcazar*, a Moorish building, was extended by several Christian princes: though the outside is mean, the inside contains several handsome courts, with fountains, galleries, and baths; the garden, said to have remained unchanged since the time of the Moors, has also its fountains, evergreens, and marble walks. In one of the saloons is a collection of Roman antiquities, from the ancient town of *Italica* in the vicinity. The *Lonja*, is a modern edifice, of the *Tuscan* order, finely situated in the centre of a square. It was built by the merchants for an exchange; but now serves chiefly as a deposit for the old official correspondence with America. Here are collections of letters from *Cortez*, *Pizarro*, and other invaders of the new world.

Water is brought to Seville from a distance of eight miles by an old Roman aqueduct. The principal rooms of a Moorish residence are also in complete preservation in the form of a double cube, sixty feet in height, and about thirty in breadth and width: the walls are covered with a net-work of exquisite workmanship, on a plaster which does not exhibit a single flaw.

In the time of the Moors Seville had an academy and public library. At present it has an academy for physical sciences, for the fine arts, and a medical society: a university founded in 1502, but almost as backward in science as at the time of its constitution; yet the number of under graduates is about 200. A humbler institution, called *St. Elmo*, is appropriated to the education of young men for the sea service. This was founded by the son of *Christopher Columbus*. There is a public library in the cathedral, and another in the archbishop's palace. Seville has genteel society; and the Spanish manners are exhibited here more conspicuously than in most parts of Spain.

The number of silk looms lately at work varied from 2000 to 3000; the silk is brought chiefly from the provinces of *Granada* and *Valencia*. Woollens of the coarser kind are also made, but, from the awkwardness of the machinery, are dearer than English cloth: there is here a considerable manufactory of leather for private account, and a very conspicuous one of tobacco and snuff for that of the government.

The mills, to the number, it is said, of 100, are all driven by horses and mules; and a similar work of mechanical power exists in the public cannon foundry.

Vessels drawing more than ten feet water are obliged to load and unload eight miles below Seville; and the largest vessels stop at *St. Lucar*, at the mouth of the river. The navigation is limited from this cause, but more from a want of industry in the inhabitants, who in general confine their exertions to the supply of immediate wants. Among the exports are wool, goat-skins, fruit, and, in a small quantity, oil and silk. The imports are various manufactures from England, *Nuremberg* wares from Germany, iron from *Bilboa*, and colonial produce. The adjacent country is of great fertility, and the markets are plentifully supplied; but the lowness of the ground exposes it to inundations and fogs, which engender agues and fevers.

Seville stands on the site of the *Hispanis* of the Romans: the date of its foundation is unknown; but it opened its gates to the Moors in 711, soon after their invasion of Spain, and continued in their possession above five centuries. It was taken from them in 1247, after one of the most obstinate sieges mentioned in Spanish history. Since then it has seldom been the scene of military exploits. A treaty was concluded here in 1729 between Spain, England, France, and Holland. In 1755 the city felt the shock of the earthquake of *Lisbon*, its cathedral having sustained considerable injury. In 1800 it was visited by the pestilential fever which caused such mortality at *Cadiz*, and it was computed that, between 12th of August and 1st of November of that year, Seville lost nearly a fourth of its inhabitants. On the invasion of Spain by *Buonaparte*, in 1808, Seville asserted the national independence, and received the junta driven from *Madrid*. It surrendered, however, to the French, on the 1st of February 1810, and remained in their hands till the 27th of August 1812, on their defeat at *Salamanca*. It is 254 miles south by west of *Madrid*, and forty-five north of *Cadiz*.

Mr. *Jacob's* observations on the different public buildings of this city, its paintings, manufactures, manners, &c., afford so lively a sketch of this part of Spain, and indeed of Spanish manners and customs generally, that we are induced to make a considerable extract from them. Speaking of the government tobacco works, he says:—"I went through the interior of the buildings, consisting of twenty-eight courts, round which the rooms for the different branches of the manufactory are arranged. It contains upwards of 100 mills for grinding the snuff, which are turned by horses and mules, while some hundreds of men and boys are employed in rolling leaf tobacco into cigars; but at present, either from the diminished consumption or the contraband trade from *Gibraltar*, there is not one-eighth part of either the mills, or the apartments for other branches of the manufactory, employed. The snuffs made here are of various kinds. The *rappee* is a bad imitation of the French snuff of that name; but that which is most esteemed is mixed with an earth from

Almazarron, between Lorca and Carthage, called *almagre*, a species of ochre; it is mixed with the tobacco in a damp state, and gives it the color, as well as that pungency and flavor, which are so much admired. By calculating the quantity of snuff manufactured and ready for delivery, I found it would produce when sold about 2,000,000 dollars, but this is calculating it at the price at which it is delivered here, which is about ten times as much as it costs the government, unless the expenses of the establishment are, as I suspect them to be, most extravagantly high: indeed I learnt that though the number of laborers was reduced to one-fifth of the usual establishment, yet, that that of the officers, whose salaries are considerable, is the same as when the consumption and consequently the revenues were much greater. I was greatly struck with the rigorous examination the laborers underwent on their leaving the *fabrica*: they were stripped almost naked, and examined as closely as if they had been working in a diamond mine; and yet, in spite of all these precautions, I was informed that they contrived to secrete considerable quantities.

‘I went from the *Fabrica de Tobacco* to see St. Elmo, a naval institution founded by Ferdinand Columbus, son of the discoverer of America, in the year 1526, but the building was not finished till several years after. Its extent and beauty are very considerable, as it was erected at a period when the architecture of Spain was at its height. The objects of this institution are most miserably neglected: it was originally designed for 150 youths, but the number at present amounts to no more than seventy; they are divided into four classes, in one of which merely reading and writing are taught; the other three are designed for the different branches of mathematics; some pretensions are also made to teach geography, algebra, geometry, and trigonometry; but having neither books, nor instruments, nor professors possessing any knowledge, their progress, I fear, is very trifling. The principal employment of the elder boys consists in copying from charts on Mercator’s Projection; but their copies were fac-similes of those from which they were taken, and, as they have no Gunter’s scale, nor any other scale of lines, sines, rhumbs, and tangents, they are incapable of constructing charts on a scale different from those before them. The name of algebra is, indeed, upon the list of studies, but the professor did not affect to understand it, and, on every subject connected with nautical science, displayed little more knowledge than most of the masters of our coasting merchant ships; he had heard of ascertaining the situation of a ship by lunar and stellar observations, and by two altitudes of the sun; but understood neither the practice nor the principles, nor even the mode of calculating azimuths and amplitudes! After seeing this institution, the superiority of British navigators is no longer surprising. In our schools for naval education, such as Christ’s Hospital, Greenwich school, and especially the academy at Portsmouth, every facility is afforded to the pupils, which instruments, books, and tutors can bestow; and it is the boast of science, that some of the bravest

officers that ever conducted British seamen to victory have been the best practical mathematicians and astronomers of their age. But, to return from this digression, the library is very deficient in books; with the exception of the French *Encyclopædia*, and a few works on astronomy in the same language, there are none adapted to a naval institution. The religious part of the establishment is, as usual, not neglected; a handsome church, with some tolerable pictures, rich plate, and a good house for the spiritual tutor, seem to have had more attention bestowed upon them than any other department. The expenses of this institution are defrayed by a small tonnage duty upon every ship that sails to America.

‘The aqueduct which supplies the city with water terminates at the gate leading to Madrid; it is called *Los Canos de Carmona*, not because the water is conveyed from that city, but because the name of this gate is *Puerto de Carmona*. It has been a matter of dispute whether this be a Roman or Moorish work, to me it appears a mixture of both; it was probably constructed originally by the former, and afterwards, as the work decayed, repaired by the latter. The arches are of different construction, some resembling the Roman, others the Moorish; which last approach nearer to the form of a horse-shoe, and terminate within the perpendicular that supports them. The water is conveyed from a hill, where it rises, near the town of *Alcalá*, about eight miles from the city. The aqueduct stands on arches twelve feet in diameter, and is supported by pillars nearly thirty feet high, in the part which I examined; but these necessarily vary in height according to the level of the ground over which the aqueduct is carried. The water is conducted in an open canal on the top of the arches, and forms a constant stream three feet wide and two feet deep, and is esteemed excellent; a part is received into a large reservoir near the gate, and the remainder is conveyed by pipes to the *alcázar*, the public fountains, and the houses of private individuals. It is obvious that the Romans, as well as the Moors, were acquainted with the method of taking the levels necessary for conducting water to their cities, though they do not appear ever to have applied that knowledge in the construction of canals, to transport heavy productions from one part of a country to another. It is also no less evident that they were unacquainted with the fact that water in a tube or pipe will ascend to its original level, or they would have supplied their cities with water by means of pipes, in preference to the far more expensive mode of conveying it by aqueducts.

‘The royal cannon foundry is a very fine building, where 200 men are constantly employed in casting and boring guns of a large calibre. The shape and ornaments of the guns are very beautiful, and they are turned and bored by the machinery used in England for similar purposes. The greatest deficiency, I observed, was the total want of machinery to facilitate labor. It is, however, the best arranged institution I have hitherto seen in Spain. The principal manager is *Senor Vedal*, a native of Catalonia,

who politely attended us through the building, and explained every part with great minuteness. He is not only a practical man, but understands chemistry and mineralogy; he is also well acquainted with the English, French, and Swedish writers on those subjects, and speaks with rapture of the recent discoveries of our countryman Davy, whose account of the new metals reached him only a short time ago. I expressed some surprise at the great number of brass guns, and remarked that the English used iron for battering cannon, which were equally serviceable, and cost no more than one-fifth the expense; he admitted the fact, but observed that, as in Spain all the copper mines paid a certain proportion of their produce to the king, that produce, which thus costs nothing, was used for cannon, and sufficiently supplied the exigencies of the state.

‘One of the buildings in Seville which displays the best architectural taste is La Lonja, built originally at the expense of the merchants, and designed for an exchange. It forms a square, and each front is 200 feet in length, and, being raised on steps, has a magnificent appearance. The staircase leading to the upper rooms is superbly built of colored marble, about twenty-five feet in breadth, with balustrades, supported by pillars of the same substance: the apartments consist of three rooms in front, each 130 feet long, and four others, lighted from the patio, of smaller dimensions; the whole forms a grand building, and does honor to the taste of the age in which it was erected. The apartments are furnished with book-cases, which contain all the correspondence with America, from its first discovery to the present time, arranged and neatly docketed; and reference may be made to any paper with great facility. The original letters of Cortez and Pizarro are deposited in these cases, and will some day probably throw light on the history of that period. It is certain that the Spanish historians have neglected to examine these valuable documents, and the writers of later date have contented themselves with quoting Robertson, whose book, with all its deficiencies, contains more accurate views, and more extensive knowledge, of the affairs of the Spaniards in America 300 years ago, than the work of any author of their own nation. La Lonja was completed in the year 1598 by Juan de Herrera, one of the most celebrated architects in Spain. In early life he visited Italy in a military capacity, and availed himself of that opportunity to study the various models of art with which that country abounds; he was an excellent mathematician, and applied his knowledge and taste to the study of architecture. After the death of Juan Bautista de Toledo he was employed in completing the Escorial, which established his fame, and occasioned his being created a knight of St. Iago, quarter-master-general of the royal palace, and superintendant of the royal mansions. I wished to make a sketch of this building, and one of the canons of the cathedral introduced me to the house of a lady opposite, where I had a good view of it. As I used the camera lucida, the astonishment of the good lady and her domestics was not a little excited; and perhaps I might have been taken

for a magician if I had not been the friend of a priest, for nothing could exceed their surprise when they saw the building before them reflected on the paper, reduced to a small compass, and every part exact.

‘The Casa Moneda, or mint, is at present very little used; owing to the scarcity of silver, few of the presses were at work, but enough were employed to show the imperfection of the machinery: the presses are worked by manual labor, and the dyes are very bad; the slowness of the work renders the coinage expensive even here, where manual labor is comparatively cheap.

‘The outside of the Alcazar is miserable in its appearance; but the first court, after entering the gate has a very grand effect: the front, looking into that court, is purely Arabic in its style, and the inscriptions favor the idea of its being built by that people; it is, nevertheless, ascertained to have been constructed since the conquest, by the Christians; and, indeed, the arms of Castile and Leon are mingled with the Arabic characters. The flight of stairs leading to the royal apartments, now occupied by Garay, is of marble; and some galleries of the same material lead to other parts of the building. The courts are ornamented with marble fountains, and are well shaded with corridors, supported by marble pillars. The hall, now occupied by the Junta, formerly called the Hall of Ambassadors, is a beautiful apartment, adorned with elegant designs in stucco, and with a floor of the most transparent marble, of various colors. The rooms adjoining are occupied by the different committees, or, as they are called, sections, into which the Junta is divided, and the whole palace, which is very extensive, is filled by the different branches of the government, whose clerks have offices very well adapted for the despatch of business, from their proximity to each other. The garden of the Alcazar is said to have been laid out by the Moors, and is preserved in its original state, it contains walks paved with marble, parterres laid out with evergreens, and well shaded with orange trees. In many parts of it there are baths, supplied by marble fountains from the aqueduct, and they have a contrivance for rendering the walks one continued fountain, by forcing up small streams of water from minute pipes in the joining of the slabs, which in this climate produces a most grateful effect. As a specimen of an Arabian garden, in its original state, this is an interesting object, and we naturally associate with it recollections gathered from the eastern writers, especially from the Song of Solomon, in the Scriptures, in which the descriptions very well agree with this garden: for, in addition to the other circumstances, it is completely walled round, and is secluded from every one except the inhabitants of one part of the palace.

‘On Sunday I went to the cathedral, to see the ceremony of high mass. There is a pomp and splendor in the Catholic worship, when performed in a country where that religion is established, which, like any other pageant, dazzles for a moment, and confines the attention to the imposing spectacle; but it is so different from any of our feelings of religion, that the impres-

sion it makes upon us differs little from that which the best scenes in a theatre produce. On those, however, who from early and repeated association have connected these ceremonies with religious ideas, and with the strong feelings of adoration and gratitude, the effect produced must be very great, though I should suspect very transient. I have frequently visited this church before, and every time with such increased admiration that I am afraid to attempt a description of it, from a consciousness of the difficulty to do justice to my own impressions. From the climate, it is necessary to exclude the heat, and of course the light; there are consequently but few windows, and those of painted glass, barely sufficient to give light enough to distinguish, on first entering, the various surrounding objects. This produces a solemn effect on the high altar, which is brilliantly illuminated with wax-tapers of an enormous size. The decorations of this altar are splendid and sumptuous beyond description; the quantity of gilding on the borders of the different compartments, filled with images and pictures, the massy silver and gold ornaments, and the rails of bronze, tastefully designed, compose a most impressive whole. The priests kneeling before the altar, and in silence offering up their devotions, the clouds of ascending incense, and the pious on their knees, in the most striking attitudes, altogether form a scene that at once captivates the imagination, and suspends the reasoning faculties; it is a scene to be felt but not described; the sensations it produces may be indulged, but cannot long delude a reflecting mind.

'In the midst of the gaieties which commence about five o'clock in the evening, when the paseo, or public walk, is crowded with company dressed in their most splendid attire, and indulging in the liveliest conversation, the sound of a bell announces the approaching hour of sunset. At this signal, which is called oracion, every one, as if by magic, seems fixed in his place; every head is uncovered, and the whole company repeats, or is supposed to repeat, a mental prayer; after a few minutes, devoted to these formalities, the lively scene is resumed, and the conversation continued from the point at which it met this pious interruption. This ceremony takes place in every part of Spain; and, where theatres or other public amusements are open, the sound of this bell suspends the entertainment till the prayer is over; so great is its effect, that it is even said that assassins, at the moment of executing their horrid design, have held their hand at the sound of the oracion, and, after repeating the habitual prayer, have perpetrated their diabolical purpose. I have reason to suspect that this practice, as well as some others, arises more from conformity to the usages of their country, than from any strong religious feelings; for I have observed in private houses, that the attention paid to this bell diminishes in proportion to the rank of the family; among the lower classes of people it is usual to kneel or stand up; among those of greater consequence they merely sit still and remain silent; while those of the highest rank suffer the bell to toll unheard and unregarded.

'No one of the various religious observances with which this city abounds, appears more ludicrous to me or more solemn to the inhabitants, than the procession of the host to the houses of the sick, at the hour of approaching dissolution. A priest, seated in a sedan chair, with the holy elements in a gold case on his lap, escorted by a guard of soldiers; and preceded by a bellman, is literally denominated by the people 'his majesty coming down the street.' To increase the singularity of the spectacle, the bellman strikes three strokes, in allusion to the three persons of the Trinity, and then ceases. At this well known sound, whatever be the state of the weather, or the condition of the streets, every one drops on his knees, and continues in this devout posture till the object of adoration is out of sight. If this procession should pass through a street containing a theatre or a ball-room, the actors on the stage, and the dancers at the assembly, alike drop on their knees till the sound is lost, when they resume their thoughtless dissipation.

'There are nightly processions through the streets of this city, called the rosario, one of which I mentioned having met, in a former letter, as I entered this place. The different wards conduct this procession by turns, so that it is every night parading in some part of the town; being more or less splendid, according to the revenues of the church or convent whence it proceeds. The rosario is complimented by the inhabitants of the streets through which it passes, by illuminations, that have a splendid effect, but which is in a great measure counteracted by the horrid noise of the singers and chanters.

'The common forms of salutation, perhaps, partake no more of religion than those of other countries; and 'va ja usted con dios,' is only equivalent to the French 'adieu,' or the English 'good bye;' but a mode of expression is adopted much more striking and singular on visiting any family; when you ring or knock, a servant within enquires, 'who calls?' and the person who wishes for admission exclaims, 'Ave Maria purissima,' to which those within, on opening the door, make response, 'Sin pecado concebida;' and as the first of these sentences cannot be uttered by the devil, and the second will not be said by a heretic, there is no danger in the visit when such orthodox formalities have been mutually exchanged. When our party has been introduced into a family, I have frequently heard the enquiry made in a whisper, 'Are they Christians?' if the persons who introduced us replied 'they are Protestants,' a sigh, with the exclamation 'que lastima' (what a pity), frequently escaped their lips. However decorous the Spaniards may be in the performance of their public devotions, nothing can be more indecent and slovenly than the manner in which their domestic worship is conducted; a circumstance which I have frequently noticed in the family with whom I lodge. Towards the conclusion of supper, when seated round the table, the master of the house commences with repeating ten Ave Maria's; the wife repeats the *Pater Noster* and her ten Ave Maria's, others at table repeat in the same manner, while one of them with a

rosary of beads keeps the account, till they have repeated the Ave Maria fifty times, and the Lord's prayer five times, the number being accurately corrected by the string of beads. They then say a litany, adding to the name of every saint of a long list, 'ora pro nobis;' then a prayer for the dead, another for protection during the night, and conclude the whole with a Gloria Patri. The words are uttered with as much rapidity as possible; and, if any employment calls away the person who is repeating, he performs the work without interrupting the prayer, or losing any time; in fact the Spaniards appear to act slowly and deliberately in every thing they undertake, except it be in this single instance of family worship.'

Mr. Jacob adds, 'It would have appeared singular, had I not been prepared for the fact, that among the warmest advocates for the destruction of ancient institutions I have seldom heard the *inquisition* spoken of as an evil of great magnitude. I have introduced the subject frequently, and have uniformly found it treated as an institution which, though originally bad, is now too insignificant to merit attention; and yet two instances have occurred within my own knowledge, since I have been here, which show its meddling disposition. An Englishman had imported some printed handkerchiefs, with patriotic emblems, and the names of the patriot generals. But the printer in England had unfortunately mixed with these patriotic emblems some of the symbols of religion, such as the crossier, the cross, and the mitre. The inquisition became acquainted with the fact, and, fearing that using handkerchiefs on which such sacred objects were imprinted, would tend to bring religion into contempt, seized the whole parcel, and they were burnt by the holy office. Another merchant had a number of bales of Spanish wool, which were about to be shipped for England; by accident these bales were marked with a cross; information of it was conveyed to the inquisitors, and a consultation was held, to determine in what mode proceedings should be instituted against a person who could apply that sacred symbol to so common a purpose. As the person in question was an undoubted Catholic, a friend gave him information of what was going forward, and, being aware of the consequences, he immediately rectified his error by protracting the upright line of the cross, and adding to the bottom of it two flukes, so that, when the officers of the inquisition came to seize the bales, they were found to be marked with an anchor, and not with a cross, as the information had stated.

'The terror of the inquisition has considerably abated of late years; one of the last victims in this city was Olavide, a most respectable man, who applied the wealth he had acquired in South America to the patriotic purpose of cultivating the Sierra Morena, with a number of German settlers and to adorning and improving the public walks of the city, as well as the wharfs on the banks of the Guadalquivir. He had read the writings of some of the French unbelievers, and was suspected of having imbibed a portion of their opinions, and for this unproved, if not

unfounded charge, he was immured within the walls of a prison, and passed many years of his life amid the horrors of solitary confinement. Since that period the discipline has been confined to a lower class of crimes, and I am informed that the only prisoners, of late, have consisted of those who merited punishment for having acted as the panders to illicit pleasure. I found no difficulty in obtaining permission to see the inquisition, and went through the whole. It is a cheerful, pleasant abode, and does not at all correspond with the ideas of Englishmen respecting it. The hall of judgment contains simply a table, three chairs for the inquisitors, a stool for the secretary, and one which is lower for the prisoner. On the table is a silver crucifix, upon which the deposition is made; and on a small stand a Latin prayer, said by each inquisitor before the trial commences. The prayer is appropriated to a judge, and merely implores divine guidance to enable him to discharge his duty with uprightness and impartiality. The records of this court, with all the processes against those who have been confined, are preserved with regularity in an adjoining room, but are not allowed to be examined. The church is simple and elegant. The interior is of white marble. The form is circular; and it is lighted from a beautiful dome. I saw one of the apartments in which prisoners are confined, and was told the others were similar; it is light and airy, placed in a little garden planted with orange and fig-trees; the door of this garden is strongly secured, and no person can have access to it when the cell is occupied. I enquired if there were any prisoners in confinement, any subterraneous cells or instruments of torture; but to these questions I could obtain no replies. The alcade, who attended us, exulted not a little at our remarking the neatness and comforts of the building, and, I suspect, mistook us for pious Catholics, because we gave vent to no execrations at the existence of such an infamous tribunal. This building was formerly the college of the Jesuits, the most able and enlightened, but the most dangerous of all the religious orders of the Catholic church. On the abolition of that order, the inquisition was removed, from its former situation in the suburb of Triana, to this building, which I hope will be the last it will occupy in Spain; for, whatever political events may take place, its destruction is inevitably at hand. The remarks I have made on the religion of Spain, you will recollect, are drawn from what I have seen in Seville, a city more esteemed for its piety than any other in Spain; so rigid, indeed, is the religion of this place, and so great the influence of the clergy, that neither a theatre, nor any place of public amusement, is permitted.'

'Of the university of Seville,' he says, 'it is almost solely appropriated to the education of the clergy: the course of study occupies five years, which are principally devoted to the acquirement of the Latin language, the knowledge of civil law, the philosophy of Aristotle, and scholastic divinity. Scarcely any improvement has been introduced within the last 400 years; the philosophy of Bacon, Locke, and Newton, is utterly unknown to either professors or pupils.

The war has considerably lessened the number of students, as a large portion has entered into the army. They do not reside within the university, but have private lodgings in different parts of the city. The education of the females of the best families is, if possible, still worse. They are early sent to a convent as pensioners, and under the care of some of the aged nuns are instructed in reading, writing, and needle-work, but especially in the outward forms of religion. They are usually kept in these houses of seclusion till they arrive at a proper age, and frequently till some matrimonial engagement is formed. From the retirement of a convent, with all its uniformity and dullness, they are suddenly introduced into circles of gaiety and dissipation, and it is not wonderful that from so violent a change, and from the example of the married females, with whom they associate, they become victims to the dissolute habits of their country.'

Of its *paintings*.—'Few places in Europe, with the exception of London and Paris, contain so many good pictures as are to be found in this city. About 170 years ago some of the best painters resided here, especially Murillo, Velasquez, Zubarán, Spagnolete, and Cano; and such was its celebrity, as a school for painting, that several eminent masters, from other countries, resorted hither for improvement in their profession. Spain made considerable progress in the art of painting during the reign of Charles V., and it was the general custom among the Spanish nobles, who attended that monarch in his visits to Italy and the Netherlands, to purchase and send home to this city, then the capital of Spain, the best pictures they could procure; some of them have been retained by private families, and others were given to the different churches and convents. Our unhappy sovereign Charles I., when Prince of Wales, contributed to increase the taste for this art in Spain by the love he manifested for the profession, by the honor he paid to the artists, and by the liberal price he gave for their works. He purchased some excellent pictures for his collection, and left directions for some of the best pictures in Madrid to be copied; especially the works of Titian in the royal palaces. Miguel de la Cruz, an artist of considerable eminence in the court of Philip IV., was occupied several years in copying the best pictures for our unfortunate monarch, which were not all completed when he met his untimely fate.

'The best ancient pictures are mostly upon subjects connected with religion; some of them are portraits of saints and martyrs, whose names as well as sufferings would perhaps have remained unknown, were they not immortalized by the genius of the artist. A great number of excellent paintings have been accumulated here; and indeed a general taste for the art has been established for ages. Most of the well informed men are connoisseurs, and more especially the priests and monks, who, from habitually contemplating, in their churches, the finest specimens of the art, acquire a correctness in their notions of painting, which renders them good judges of even those paintings that are unconnected with religion. A general fondness for the art prevails

in this capital, and most people, particularly the ladies, have in their apartments the best pictures of the Holy Virgin, or some favorite saint, which their circumstances can afford. To these they are much attached, and retain them with care, even when reduced by poverty to sell every thing else. I was yesterday at the house of a lady, the widow of an officer, to see some pictures which necessity compelled her to sell, but which decent pride forbade her to part with to any except a foreigner. In her chamber was a crucifixion, which I admired, and asked if it were to be sold; 'No, Señor, lo tengo por mi devoción;' she then asked with surprise, 'Are you a Christian?' On my answering 'Yes,' and that I respected the saints, she expressed herself delighted that among the English, whom she had been told were all Protestants, she had found one who was a Catholic; for, though she appeared a woman who had moved in a respectable sphere, she had no conception that Christian and Catholic were not precisely synonymous; and I was too intent on her pictures to find time to correct her vocabulary.

'It is scarcely right in relating any thing to commence with the best; and perhaps I should be wiser were I to delay writing about the pictures of Murillo, till I had described those of some inferior artists; but, as it happens, I am just returned from inspecting his works in the chapel of St. George, in the Caridad: I shall therefore begin my account with them. The pictures of Murillo which have been brought to England are of small size, and generally contain few figures, so that you can form but a very imperfect idea of the powers of this distinguished artist; but the pictures of this painter in the Caridad, are about eighteen feet in length, and twelve in breadth. One of them, representing the queen Isabella attending the sick, and washing the wounds on the head of a beggar boy, while a crowd of other invalids, are waiting round in expectation of similar relief, is considered, and I think justly, one of the best compositions of that great master: the pious countenance of the queen, and the anxious looks of the expecting group, are admirably depicted. Another painting, by the same master, is the miracle of the loaves and fishes, in which the figures on the foreground are finely conceived, and the light and shade admirably managed. The picture of the angels appearing to Abraham is finely painted; but as the idea prevailing in Spain is, that those three angels were the three persons of the Trinity, the artist has thought proper to show the unity in the Trinity by painting all the three angels with exactly the same countenance: notwithstanding this whimsical conceit the picture is a fine one, and the scene of the tent of the Arabian patriarch is most exquisitely painted.

'Moses striking the rock is a most wonderful production; the anxious countenances of the Israelites, all eagerly crowding to the water, are exact representations of what might be supposed the expressions of people in such a state: the figure of the mother with an infant, eagerly stretching out her hand to catch a few drops for her child, another lamenting the delay in obtaining a supply, and a boy mounted on a horse, stretching

forward to the stream, are esteemed the best figures, while the countenances of all discover gratitude to God for this unexpected supply. I never felt so much pleasure from the contemplation of any work of art as from this picture; but, notwithstanding the admirable expressions of the countenances, I could not help admiring the shadow of the rock from which the water gushes out. A passage in the sacred writings mentions as a luxury 'the shadow of a great rock in a desert wilderness;' it is here displayed most admirably; the rock is high and large; within its shade the people appear protected from the rays of the sun, which seem to diffuse a burning heat over every other part of the scene.

'The Cathedral of Seville contains some paintings by Murillo, but in my judgment very far inferior to those at the Caridad; the best are on the altar of Baptistry; representing St Anthony of Padua, the Baptism of Christ; and the Birth of the Virgin, in the chapel dedicated to St. Paul. Besides these, almost every convent and church in Seville is adorned with some of this master's productions. I have had the good fortune to meet with some of his sketches, and an admirable portrait of his son, which, if I get them to England, will please you, though they give but a very faint idea of his great powers.

'Few pictures have been more praised than those in the church of Santa Cruz, by Pedro de Campaña, especially the Descent from the Cross. It is said of this picture, by the learned doctor Francisco Pacheco, that the remaining in this church alone filled him with terror, as he could not divest himself of the idea that the body of Christ was a real object. Two men above are lowering the body to St. John, who receives it with the strongest expression of grief and sensibility. Mary Magdalen kissing the feet, and the Holy Virgin, are admirable figures. The whole piece is an exquisite composition; and, in the judgment of the Spanish connoisseurs, equal to the best productions of Michel Angelo, under whom Campaña studied. The picture is about eighteen feet in height and nine in breadth. There are several others in this church by the same master, but this one engrossed my attention too much to allow me to examine the others.'

But we must hasten to conclude our extracts:—'The architecture of Seville', adds our author, 'deserves particular notice, as it is the work of different ages, and possesses very distinct characters. The Arabian, the Gothic, and the Greco-Roman styles, all enter into the structure of the cathedral. Its tower, constructed in the year 1000, is of the Arabian architecture, as well as one of the courts, called the Patio de las Naranjas. The Gothic style was not introduced into Spain till the twelfth century; and it still retains the more appropriate epithet of Tudesco or German. The greater part of the cathedral, which was begun in 1482 and finished in 1519, is of this species of architecture. The Greco-Roman, used in Spain, is miserable in the distribution of the parts, lavish in the ornaments, and wants elegance in the whole. The royal chapel of the cathedral is in this style of building, though erected at the same period with the Gothic. The length of the church is 393 feet,

and the breadth 220; the choir and the high altar being in the centre, and the whole crowded with chapels, altars, statues, and pictures, it does not appear so large as it is in reality. The inside of the tower has one singularity; it has no steps, but in their stead a road winds to the top, by which it is said the Emperor Charles V. once rode on horseback to the summit. This certainly would not be difficult if the door to the road were larger, but at present it is so narrow that a man can scarcely enter it. The cathedral contains a fine organ of great power, which is filled with air in a singular manner, by means of a plank placed on the bellows, on which a man walks backwards and forwards, and, as it balances on its centre, his motion fills the organ with air.

'A few days ago, I went, with a small party, to see the convent of the Carthusians. It is situated on the banks of the Guadalquivir, above the city, and we found a boat the cheapest and most agreeable conveyance. The convent is a fine building, and the interior is sumptuously decorated. The monks, who are all descended from good families, live with frugality, or rather austerity, and never leave the convent after they have taken the vows. They are not permitted to converse, except with each other, and they are allowed only an hour's conversation twice in a week; but, if I may judge from the rubicund faces and portly figures of the superiors, when they arrive at the higher stations, they indulge privately in luxuries beyond the limits of their vows. It is easy to conceive that that fanaticism which can induce gentlemen to enter into this order, and to endure the severities during the year of their noviciate, may, after a time, cease; that the fervor of devotion may subside; that some embers of the feelings and habits of past life may be rekindled; and that, after they have begun to languish in their piety, they may fall from the grace of celibacy, or exchange their fasts and penances for a luxurious table, generous wines, and an affectionate mistress. We found the prior a good-tempered friendly man; he expressed much regard for Englishmen, but lamented the wickedness and sensuality of Henry VIII., whose unruly passions, he said, had caused that change of religion so unfortunate for our country. I cannot help remarking, in this place, that there is a material difference between the Catholics and Protestants, in the mode of treating each other on religious subjects. The former generally speak of our religion with a sigh: we too frequently speak of theirs with a sneer. I am afraid something of this kind escaped me, or my younger companions, as his officious kindness evidently ceased after his remark on Henry VIII.; and, though he behaved with politeness, it was ceremonious, and obviously constrained.

'The church is very splendid, and elegantly adorned with holy utensils of gold and silver, with some good pictures and statues, and a remarkably fine organ. Among the pictures is the head of John the Baptist and a *Salvator Mundi*, by Murillo; a St. Peter by Morales, called by way of distinction (as there were several painters of that name) the divine Morales; and, what pleased me more than any others, some fine pieces of Zubaran, an artist whose works are

highly valued in Spain, though they are scarcely known in any other part of Europe. There are three of his productions in the sacristy of this church, with figures as large as life. The subject of one is, St. Bruno conversing with pope Urban II.: the saint is seated: his countenance has the expression of benevolence, and that of the pope of piety and submission. The subject of another picture is St. Hugh in the refectory of this convent, eating with the monks; and a third represents our Saviour on foot, conversing with some Carthusians: there is nothing in the stories, but the artist has contrived to make them interesting. Zubaran's manner somewhat resembles that of Caravaggio; his outlines are correct, and his compositions simple; they contain only a few figures, which are arranged in grave and natural attitudes. I have always had a curiosity to see the collections of books in these repositories of idle devotion, but what I saw here were of no greater value than those in convents less richly endowed. The Carthusians are the richest order in Spain, and the estates of this convent are very extensive and valuable; their revenues are all appropriated to determinate purposes, one portion for subsistence another for the repairs and decoration of the church, and others for the relief of the poor, &c.; all of which being badly administered, the society is considerably involved. They cultivate some large farms, and have in their barns and outhouses a good stock of corn, straw, and oil, as well as horses, cows, and mules, which the government have lately found very beneficial; for, in the present exigencies of the country, the property of these religious houses has not been exempted from contributions. They have a fine garden, and a summer-house overlooking the river. The consumption of wax for candles is so considerable, that they have in this garden all the necessary conveniences for bleaching it.

SEVRES, DEPARTMENT OF THE TWO, a department of France, comprising about a third of the old province of Poitou, and bounded by the departments of the Maine and Loire, the Charente, and the Vendée. Its superficial extent is 2450 square miles; watered by the Two Severs, the Dive, the Loire, the Thoue, and a number of inferior streams. The surface is uneven, being intersected from north-east to south-west by a chain of lofty mountains covered with wood; in the south-west it is marshy, but the soil generally is fertile, and the climate favorable. The products are wheat, barley, rye, oats, buck-wheat, and maize; hops grow wild, particularly in the neighbourhood of Niort. Tobacco is partially cultivated, and chestnuts abound, as well as almonds, in the warmer exposures. The tracts of pasture are considerable, and hence a large proportion of horses, cattle, and sheep. The high grounds afford mines of iron, antimony, saltpetre, also quarries of marble. The manufactures (on a small scale) consist of pottery, saltpetre, leather, woollens, cotton, and paper. This department suffered severely in the Vendean war. It is divided into the four arrondissements of Niort, the capital, Bressuire, Parthenay, and Melle. Population 260,000, of whom above 32,000 are Protestants.

SEVUM MINERALE, mineral tallow, a substance somewhat resembling tallow, found on the sea-coasts of Finland in 1736. It burns with a blue flame, and smell of grease, leaving a black viscid matter which cannot easily be consumed. It is extremely light; being only of the specific gravity 0.770; whereas tallow is not less than 0.969. It is partly soluble in highly rectified spirit of wine, but entirely so in expressed oils when boiling. It is met with in some of the rocky parts of Persia, but there it appears to be mixed with petroleum. Dr. Herman of Strasburg mentions a spring in the neighbourhood of that city, which contains a substance of this sort diffused through it, separating, and capable of being collected on ebullition. A fat mineral matter resembling butter or tallow has lately been extracted from peat in Lancashire. See PEAT.

SEW, *v. n.* *Lat suo.* To alter any thing by the use of the needle.

My transgression is sealed up in a bag, and thou sewest up mine iniquity. *Job xiv. 17.*

A time to rent and a time to sew. *Ecc. iii. 7.*

No man seweth a piece of new cloth on an old garment. *Mark ii. 21.*

If ever I said loose-bodied gown sew me up in the skirts of it. *Shakspeare. Taming of the Shrew.*

SEWARD (Thomas), an English divine, born in 1708. He was rector of Eyam in Derbyshire, and prebend of Litchfield. He wrote a work on the Conformity between Popery and Paganism, and published an edition of Beaumont and Fletcher's plays. He was father of the celebrated Miss Anna Seward. He died at Litchfield, in 1790.

SEWARD (William), F. R. S., an ingenious English writer, the son of an eminent brewer in London, born in 1747. He was educated at the Charter-house, and at the university of Oxford, but never took any degree, nor adopted any profession. He had a fine taste for literature; was intimate with the most eminent men of the age; and was chosen fellow of the Royal and Antiquarian Societies. He published *Anecdotes of Distinguished Persons*, in 5 vols., and a supplement to that work, entitled *Biographiana*, in 2 vols. He died April 12th, 1799.

SEWARD (Anna), the daughter of the Rev. Thomas Seward, rector of Eyam, Derbyshire, prebendary of Sarum, and canon residentiary of Litchfield, was born in the year 1747. Her father was himself a poet, and seems to have inspired his daughter with a strong predilection for that department of literature, in which her taste was excellent, and her talents considerable. In the Literary Society of Litchfield, where Miss Seward lived, she held a very distinguished place, and her correspondence with learned and distinguished characters was extensive. For a considerable period her poetical effusions were confined to her social circle; the applause of which at length induced her to commit to the press, *Elegiac Commemorations of Major Andrcé and Captain Cook*, which were favorably received by the public. In 1782, besides other occasional pieces, she published a poetical novel, entitled *Louisa*, which was also favorably received, and passed through several editions. In 1799 she published a collection of original son-

nets of considerable merit, with translations from Horace of less value. In 1804 Miss Seward published a Biographical Memoir of Dr. Darwin, the friend of her youth; in which there is much curious and interesting literary anecdote, chiefly of the early part of Dr. Darwin's life, and of the Society of Litchfield, while it was the place of his residence. In 1807 our authoress was engaged in arranging for the press the edition of her poems, which was edited, in 1810, by Walter Scott, esq., in 3 vols., with a sketch of her life by that poet, and extracts from her literary correspondence. To Mr. Scott she bequeathed by letter her literary performances, particularly that which she had been so long preparing for the press. Miss Seward died on the 25th of March 1809, having also bequeathed to Mr. A. Constable twelve quarto volumes of letters, from the year 1784 to the period of her death, for publication. Six volumes of these have been published, containing a vast variety of miscellaneous matter, of which the world will judge variously. That Miss Seward's talents and acquirements were considerable will not be questioned. Her prejudices were also great, and her reflections on many persons and subjects are unnecessarily harsh, and severe. In politics, amidst the ever varying scenes of the French Revolution, and of domestic policy connected with that great event, she cannot be exempted from the charge of rashness, injustice, and inconsistency. Miss Seward was undoubtedly a distinguished person; but she already holds in public estimation a far less eminent place than she fixed for herself. In her conduct she was always respectable.

SEWAURY, a Hindoo word, used in Bengal, signifying the train of attendants that accompany a nabob.

SEWELL (George), an English physician and poet; born at Windsor and educated at Eton School; whence he removed to Peter House, Cambridge. He wrote, 1. *The Life of John Philips*; 2. *A Vindication of the English Stage*: 3. *Sir Walter Raleigh*, a tragedy; which was acted, in 1719, at Lincoln's-Inn-Fields. He died in 1726.

SEWELL (William), a native of Holland, born about 1654. He was bred to surgery, and practised it at Amsterdam. He wrote the *History of the Rise and Progress of the People called Quakers*; and compiled a Dictionary of the English and Low Dutch Tongues.

SEWER, *n. s.* Fr. *escuyer trenchant*; or old Fr. *assecur*, from *asseoir* to set down; for those officers set the dishes on the table.—Newton. An officer who serves up a feast.

Marshall'd feast,

Served up in hall with sewers and seneschals:

The skill of artifice or office mean. *Milton.*

The cook and sewer each his talent tries,
In various figures scenes of dishes rise. *Swift.*

SEWER, *n. s.* From *issue*, *issuer*. A passage for water to run through, often corrupted to shore.

The fenmen hold that the sewers must be kept so,
as the water may not stay too long in the spring, till
the weeds and sedge be grown up. *Bacon.*

Men suffer their private judgment to be drawn into
the common sewer or stream of the present vogue.

King Charles

As one who long in populous city pent,
Where houses thick, and sewers annoy the air,
Forth issuing on a summer's morn to breathe
Among the pleasant villages and farms
Adjoined from each thing met conceives delight.

Milton.

SEWERS, COMMON, in ancient Rome, were executed at a great expense. It was proposed that they should be of sufficient dimensions to admit a waggon loaded with hay. When these common sewers came to be obstructed, or out of repair, under the republic, the censors contracted to pay 1000 talents, or about £193,000 for clearing and repairing them. They were again in disrepair at the accession of Augustus, and the reinstating them is mentioned among the great works of Agrippa. He is said to have turned the course of seven rivers into these subterraneous passages, to have made them navigable, and to have actually passed in barges under the streets and buildings of Rome. These works are still supposed to remain; but, as they exceed the power and resources of the present city to keep them in repair, they are quite concealed, except at one or two places. They were, in the midst of the Roman greatness, and still are, reckoned among the wonders of the world; and yet they are said to have been works of Tarquin I., a prince whose territory did not extend, in any direction, above sixteen miles; and, on this supposition, they must have been made to accommodate a city that was calculated chiefly for the reception of cattle, herdsmen, and banditti. Rude nations sometimes execute works of great magnificence, as fortresses and temples, for the purposes of war and superstition; but seldom palaces, and still more seldom works of mere convenience and cleanliness, in which for the most part they are long defective. It is not unreasonable, therefore, to question the authority of tradition in respect of this singular monument of antiquity, which so greatly exceeds what the best accommodated city of modern Europe could undertake: and as those works are still entire, and may continue so for thousands of years, it has been suspected that they were even prior to the settlement of Romulus, and may have been the remains of a more ancient city, on the ruins of which the followers of Romulus settled, as the Arabs now encamp on the ruins of Palmyra and Balbeck. Livy owns that the common sewers were not accommodated to the plan of Rome, as it was laid out in his time; they were carried in directions across the streets, and passed under buildings of the greatest antiquity. This derangement indeed he imputes to the hasty rebuilding of the city after its destruction by the Gauls; but haste, it is probable, would have determined the people to build on their old foundations, or at least not to change them so much as to cross the direction of former streets.

SEWERS, COURT OF COMMISSIONERS OF, a temporary tribunal in England, erected by virtue of a commission under the great seal; which formerly used to be granted *pro re nata* at the pleasure of the crown, but now at the discretion and nomination of the lord chancellor, lord trea-

suror, and chief justices, pursuant to the statute 23 Hen. VIII. c. 5. Their jurisdiction is to overlook the repairs of sea-banks and sea-walls and the cleansing of rivers, public streams, ditches, and other conduits, whereby any waters are carried off; and is confined to such county or particular district as the commission shall expressly name. The commissioners are a court of record, and may fine and imprison for contempt; and in the execution of their duty may proceed by jury, or upon their own view, and may take order for the removal of any annoyances, or the safeguard and conservation of the sewers within their commission, either according to the laws and customs of Romney-marsh, or otherwise at their own discretion. They may also assess such rates or scots upon the owners of lands within their district as they shall judge necessary; and, if any person refuse to pay them, the commissioners may levy the same by distress of his goods and chattels; or they may, by statute 23 Hen. VIII. c. 5, sell his freehold lands (and by the 7 Ann. c. 10, his copyhold also), in order to pay such scots or assessments. But their conduct is under the control of the court of king's bench, which will prevent or punish any illegal or tyrannical proceedings. And yet in the reign of king James I. (8th of November 1616) the privy council took upon them to order that no action or complaint should be prosecuted against the commissioners unless before that board; and committed several to prison who had brought such actions at common law, till they should release the same: and one of the reasons for discharging Sir Edward Coke from his office of lord chief justice was for countenancing those legal proceedings. The pretence for these arbitrary measures was no other than the tyrant's plea for the necessity of unlimited powers in works of evident utility to the public—'the supreme reason above all reasons, which is the salvation of the king's lands and people.' But now it is clearly held that this (as well as all other inferior jurisdictions) is subject to the discretionary coercion of his majesty's court of king's bench.

SEX, *n. s.* Fr. *sexe*; Lat. *sexis*. The property by which any animal is male or female.

These two great *sexes* animate the world. *Milton*.

Under his forming hands a creature grew,
Manlike, but different *sex*. *Id.*

Shame is hard to be overcome; but, if the *sex* once get the better of it, it gives them afterwards no more trouble. *Garth*.

SEXACESSES, in Roman antiquity, a coin valued at sixty asses.

SEXAGENARY, or SEXAGESIMAL ARITHMETIC, is a method of computation proceeding by sixties; such is that used in the division of a degree into sixty minutes, of the minute into sixty seconds, of the second into sixty thirds, &c.

SEXAGENARY TABLES are tables of proportional parts, showing the product of two sexagenaries that are to be multiplied, or the quotient of the two that are to be divided.

SEXAGESIMA is the Sunday next to Shrove Sunday, so called as being about the sixtieth day before Easter.

SEXAGESIMALS, or SEXAGESIMAL FRACTIONS, fractions whose denominators proceed in a

sexagecuple ratio; that is a prime, or the first minute, $= \frac{1}{60}$; a second $= \frac{1}{3600}$; a third $= \frac{1}{216000}$. Anciently there were no other than sexagesimals used in astronomy; and they are still retained in many cases, though decimal arithmetic begins to grow in use now in astronomical calculation. In these fractions, which some call astronomical fractions, the denominator being always 60, or a multiple thereof, is usually omitted, and the numerator only written down: thus, $4^{\circ}, 59', 32''$ $40'''$, is to be read, 4 degrees, 59 minutes, 32 seconds, 40 thirds, 16 fourths, &c.

SEXANGLED, *adj.* } From Lat. *sex* and
SEXANGULAR. } *angulus*. Having six
corners or angles; hexagonal.

The grubs from their *sexangular* abode
Crawl out unfinished like the maggot's brood.

Dryden.

SEXTANS, SEXTANT, a sixth part of certain things. The Romans having divided their *as* into twelve uncie or ounces, the sixth part of that, or two ounces, was the sextans.

SEXTANS was also a measure which contained two ounces of liquor, or two cyathi.

SEXTANS, in astronomy, a constellation of the southern hemisphere, made by Hevelius out of unformed stars. See ASTRONOMY.

SEXTANT, in mathematics, denotes an arch comprehending 60° .

SEXTANT is also particularly used for an astronomical instrument made like a quadrant, excepting that its limb only comprehends 60° . The use and application of the sextant is the same with that of the quadrant. See QUADRANT, and NAVIGATION.

SEXTILE AQUÆ, an ancient town of Gallia Cisalpina, built by Caius Sextius, a lieutenant of Julius Caesar, famous for its hot and cold baths. The Cimbri were defeated near it by Marius. (Liv. 61, Vel. Pat. 1. c. 15). It is now called Aix.

SEXTILE, *adj.* Lat. *sextilis*. In such a position or aspect of two planets, when at 60° distance, or at the distance of two signs from one another, marked thus *.

Planetary motions and aspects,

In *sextile*, square, and trine. *Milton*.

The moon receives the dusky light we discern in
its *sextile* aspect from the earth's benignity.

Clanville.

SEXTILE TWICE, or BIS-SEXTILE, in chronology, the name given by the Romans to the intercalary day which followed the sixth of the kalends of March every leap-year, which is hence still called bissextile.

SEXTILIS (Lat. i. e. the sixth month, from March), in chronology, the name given by the Romans to the month of August, during the whole time of the kingdom and republic, and until the reign of the emperor Augustus, when it was changed in compliment to him, as Quintilis had been previously changed to July in honor of his uncle Julius Cæsar. See ROME.

SEXTIUS (Quintus), a Pythagorean philosopher, who flourished under Augustus. He seemed formed to rise in the republic; but he shrunk from civil honors, and declined accepting the rank of senator when it was offered him by

Julius Cæsar, that he might have time to apply to philosophy. It appears that he wished to establish a school at Rome, and that his tenets, though chiefly drawn from the doctrines of Pythagoras, in some particulars resembled those of the Stoics. His laws were tinged with great severity; and, in an early period of his establishment, he found his mind so harassed, and the harshness of the doctrines which he wished to establish so repulsive to his feelings, that he nearly worked himself up to such a height of desperation, as to put a period to his existence. Of the school of Sextius were Fabianus, Sotion, Flavianus, Crassitius, and Celsus. Of his works only a few fragments remain; and whether any of them formed a part of the work which Seneca admired so much cannot now be determined. Some of his maxims are valuable. He recommended an examination of the actions of the day to his scholars when they retired to rest; he taught that the road to heaven (*ad astra*) was by frugality, temperance, and fortitude. He used to recommend holding a looking-glass before persons disordered with passion. He enjoined his scholars to abstain from animal food.

SEXTON, n. s. Corrupted from sacristan. An under officer of the church, whose business is to dig graves.

A stool and cushion for the *sexton*. *Shakspeare.*

When any dies then, by tolling a bell or bespeaking a grave of the *sexton*, the same is known to the searchers corresponding with the said *sexton*.

Græunt.

They may get a dispensation to hold the clerkship and *sextonship* of their own parish in commendam. *Swift.*

SEXTON is thus called by corruption of the Latin *sacrista*, or Saxon *segerstone*, which denotes the same. His office is to take care of the vessels, vestments, &c., belonging to the church; and to attend the minister, churchwarden, &c., at church. He is usually chosen by the parson only. Sextons, as well as parish-clerks, are regarded by the common law as persons who have freehold in their offices; and therefore, though they may be punished, yet they cannot be deprived, by ecclesiastical censures. The office of sexton in the pope's chapel is appropriated to the order of the hermits of St. Augustine. He is generally a bishop, though sometimes the pope only gives a bishopric in partibus to him on whom he confers the post. He takes the title of Prefect of the pope's Sacristy, and has the keeping of the vessels of gold and silver, the relics, &c. When the pope says mass, the sexton always tastes the bread and wine first. If it be in private he says mass, his holiness, of two wafers, gives him one to eat; and, if in public, the cardinal, who assists the pope in quality of deacon, of three wafers, gives him two to eat. When the pope is desperately sick, he administers to him the sacrament of extreme unction, &c., and enters the conclave in quality of first conclavist. The office of a sexton in Sweden is somewhat singular. During M. Outhier's stay at Stockholm, in 1736, he visited the church of St. Clara, and during divine service he observed a sexton going about with a long rod, waking those persons who had fallen asleep.

SEXTUPLE, adj. Lat. *sextuplus*. Six fold; six times told.

Man's length, being a perpendicular from the vertex unto the sole of the foot, is *sextuple* unto his breadth, or a right line drawn from the ribs of one side to another. *Brown.*

SEXTUPLE, in music, denotes a mixed sort of triple, which is beaten into double time.

SEXTUS, a Stoic philosopher, born at Chæronæa in Bœotia, and said to be nephew of Plutarch. He was preceptor to the emperors Marcus Aurelius and Lucius Verus.

SEXTUS EMPIRICUS, a famous Pyrrhonian philosopher, who lived in the second century, under Antoninus. He was a physician of the sect of the Empirics, and is said to have been one of the preceptors of Antoninus the philosopher. There are still extant his Pyrrhonian Institutions, and a large work against the mathematicians, &c. The best edition of Sextus Empiricus is that of Fabricius in Greek and Latin, printed at Leipsic in 1718, folio.

SEXTUS POMPEIUS FESTUS. See *FESTUS*.

SEXTUS TARQUINIUS, one of the sons of Tarquin II., the last king of Rome;—whose unbridled lust occasioned the suicide of Lucretia, and the consequent revolution of Rome, by the abolition of the monarchy, and the erection of the Roman republic. See *ROME*.

SEXUAL SYSTEM, the beautiful system of botany discovered and arranged by Linnaeus. See *BOTANY*, Index.

SEXUALISTE (Sexualists), among botanical writers, those who have established the classes of plants upon the differences of the sexes and parts of fructification in plants, according to the modern method; as Linnaeus, &c.

SEYDLER SALT, or **SEDLITZ SALT**, names given to Epsom salt (see *MINERAL WATERS*); now named, with more propriety, sulphate of magnesia.

SEZAWUL [Hindoo], in Bengal, an officer employed occasionally to collect the revenue, and enforce payment.

SFORZA (James), the founder of the illustrious house of Sforza, which acted so conspicuous a part in Italy during the fifteenth and sixteenth centuries, which gave six dukes to Milan, and contracted alliances with almost every sovereign in Europe. James Sforza was born on the 28th of May, 1369, at Catignola, a small town in Italy, between Imola and Faenza. His father was a day-laborer, or, according to Commynes, a shoemaker. A company of soldiers happening one day to pass through Catignola, he was seized with the desire of accompanying them to the wars. 'I will go,' said he to himself, 'and dart my hatchet against that tree; and, if it stick fast in the wood, I will immediately become a soldier.' The hatchet accordingly stuck fast, and our adventurer enlisted; and because, says the abbé de Choisi, he had thrown the axe with all his force, he assumed the name of Sforza; for his true name was Giacomuzzo or James Attendulo. He rose rapidly in the army, and soon became commander of 7000 men. He defended the cause of Jane II. queen of Naples for many years, and was made constable of her kingdom. He was created

count of Catignola by pope John XXII. by way of paying a debt of 14,000 ducats, which the church of Rome owed him. His exploits became every day more illustrious; he obliged Alphonso king of Arragon to raise the siege of Naples; and reduced several places that had revolted in Abruzzo and Le Labour; but while in pursuit of his enemies he was unfortunately drowned in the river Aterno on the 3d of January, 1424, at the age of fifty-four years. In his youth he fell in love with a woman called Lucia Trezana, whom he married, after she had borne him several children. He married afterwards Antoinette Salembini, who brought him several excellent estates; she bore him Bosio Sforza, comte of Spata-Flor, a warrior and governor of Orvietta for pope Martin V. His third wife was Catharine Alopa, sister of Rodolpho, grand chamberlain to the sovereign of Naples. His last wife was Mary Marzana, daughter to the duke of Sessa. She bore him Charles Sforza, who was general of the order of Augustines, and archbishop of Milan.

SFORZA (Francis), the son of James Sforza, by Lucia Trezana, was born in 1401, and trained up by his father to the profession of arms. At the age of twenty-three he defeated the troops of Braccio, who disputed with him the passage of the Aterno. In this action his father was drowned, and Francis, though illegitimate, succeeded him. He fought successfully against the Spaniards, and contributed a great deal both towards raising the siege of Naples, and to the victory which was gained over the troops of Braccio near Aquila, in 1425, where that general was killed. After the death of queen Jane, in 1435, he espoused the interests of the duke of Anjou, to whom she had left her crown, and by his courage and abilities ably supported that unfortunate prince. He made himself master of several places in Ancona, from which he was driven by pope Eugenius IV., who defeated and excommunicated him; but he soon re-established his affairs by a victory. His reputation was now so great that the pope, the Venetians, and the Florentines, chose him for their general against the duke of Milan. Sforza had already conducted Venetian armies against that prince, though he had espoused his daughter. The duke dying, in 1447, the inhabitants of Milan invited Sforza, his son-in-law, to lead them against that duke. But, after some exertions in their favor, he turned his arms against themselves, laid siege to Milan, and obliged them to receive him as duke, notwithstanding the rights of Charles duke of Orleans, the son of Valentine of Milan. In 1464 Louis XI., who hated Orleans, gave up to Sforza the rights which the crown of France had over Genoa, and even put into his hands Savona, a town belonging to that republic. The duke of Milan soon after made himself master of Genoa. He died in 1466, with the reputation of a man who was willing to sell his blood to the best purchaser, and who was not too scrupulous an observer of his word. His second wife was Blanche Marie, natural daughter of Philip Marie duke of Milan. She bore him Galeas Marie, and Ludovic Marie, dukes of Milan, Philip Marie count of Pavia. Sforza Marie

duke of Bari, Ascanius Marie bishop of Pavia and Cremona, and a cardinal. He was taken prisoner by the troops of Louis XII., and confined for some time in the tower of Bourges. He was a cunning man, and deceived cardinal d'Amboise when that prelate aspired at the papacy. His daughters were Hyppolita, married to Alphonso of Arragon, afterwards king of Naples, and Elizabeth, married to William marquis of Montferrat. He had also several natural children.

SHAB'BY, *adj.* } Belg. *schaben*. A word

SHAB'BINESS, *n. s.* } that has crept into conversation and low writing, but ought not to be admitted into the language, says Johnson. Mean; paltry: the noun substantive corresponding.

He exchanged his gay *shabbiness* of clothes, fit for a much younger man, to warm ones that would be decent for a much older one. *Spectator*.

The dean was so *shabby*, and looked like a ninny. That the captain supposed he was curate to Jenny. *Swift*.

SHACK, in ancient customs, a liberty of winter-pasturage. In the counties of Norfolk and Suffolk the lord of the manor has *shack*, i. e. a liberty of feeding his sheep at pleasure in his tenants' lands during the six winter months. In Norfolk, *shack* also extends to the common for hogs, in all men's grounds, from the end of harvest till seed-time. Whence to go a-shack, is to feed at large.

SHACKLE, *v. a. & n. s.* Belg. *scharckelen*. To chain; to fetter; to bind: the noun substantive corresponding.

Himself he frees by secret means unseen,
His *shackles* empty left, himself escaped clean.

Faerie Queen.

It is great,
To do that thing that ends all other deeds;
Which *shackles* accidents, and bolts up change.

Shakespeare.

The forge in fetters only is employed;
Our iron mines exhausted and destroyed
In *shackles*.

Dryden's Juvenal.

You must not *shackle* and tie him up with rules
about indifferent matters. *Locke*.

So the stretched cord the *shackled* dancer tries,
As prone to fall as impotent to rise. *Smith*.

A servant commonly is less free in mind than in condition; his very will seems to be in bonds and *shackles*, and desire itself under durance and captivity. *South*.

No trivial price
Should set him free, or small should be my praise
To lead him *shackled*. *Philips*.

SHACKLES, aboard a ship, are those oblong iron rings, bigger at one end than at the other, with which the ports are shut fast, by thrusting the wooden bar of the port through them. There is also a sort of shackles to lift the hatches up with, of a like figure, but smaller. They are fastened at the corners of the hatches.

SHAD, a large species of herring (*clupea*) which inhabits the sea near the mouths of large rivers, and in the spring ascends them for the purpose of depositing its spawn in the shallow water about their sources. The young fry remain for a season in the waters which gave them birth, but on the approach of cold weather descend the rivers, and take refuge in the ocean.

The old ones likewise return, and at this time are emaciated and unfit for food. The form of the shad is the same as that of the other herrings, very much compressed, with the abdomen gradually becoming thinner, and forming a serrated edge; and, like them, the bones are much more numerous and more slender than in other fish. The shad which frequents the waters of America has not been accurately compared with the European, but is probably a different species. It usually weighs four or five pounds, but sometimes twelve: the scales are easily detached, when a row of dark spots is exposed on each side. It is found in all the rivers of the Atlantic coast, is highly esteemed for food, and is consumed in great quantities, in the fresh state, in some American cities. During the season they are an important source of wealth to the inhabitants of the borders of the Hudson, Delaware, and Chesapeake. Great quantities are salted, but are less esteemed than when eaten fresh.

SHADDOCK, a large species of orange, attaining the diameter of seven or eight inches, with a white, thick, spongy and bitter rind, and a red or white pulp, of a sweet taste, mingled with acidity. It is a native of China and Japan, and was brought to the West Indies by a Captain Shaddock, from whom it has derived its name. It is often called *pampelmoes*. See **ORANGE**.

SHADE, *n. s. & v. a.* Sax. *readu*; Belg.

SHAD'OW, *n. s.* { *schade*; Teut. *schatten*.

SHAD'OWY, *adj.* { The darkness caused

SHAD'Y. { by an interception of

light; obscurity; an obscure or retired place; coolness made by the interception of light; screen; shelter; the darker parts of a picture; a gradation of light; the dark outline of a body, formed by its being placed between any surface and the light; the soul, considered as separate from the body: to shade is to cover from light or heat; shelter; protect; mark the gradations of light: shadow is synonymous with shade in most of its senses, but is more commonly used for the representation of a body which intercepts the light; an imperfect or faint representation of any kind; an inseparable companion or follower; a typical or mystical representation: the verb and adjective strictly corresponding with shade, noun substantive: shady expressing an abundance of shade.

A *shadow* is a diminution of the first and second light. The first light is that which proceeds immediately from a lightened body, as the beams of the sun. The second is an accidental light, spreading itself into the air, or medium, proceeding from the other. *Shadows* are threefold: the first is a single *shadow*, and the least of all: and is proper to the plain surface, where it is not wholly possessed of the light. The second is the double *shadow*, and it is used when the surface begins once to forsake your eye as in columns. The third *shadow* is made by crossing over your double *shadow* again, which darkeneth by a third part. It is used for the inmost *shadow*, and farthest from the light, as in gulfs, wells, and caves.

Turnsoil is made of old linen rags dried, and laid in a saucer of vinegar, and set over a chafing-dish of coals, till it boil; then wring it into a shell, and put

it into a little gum arabick: it is good to *shadow* carnations and all yellows. *Id.*

The wakeful bird

Sings darkling, and in *shadiest* covert hid
Tunes her nocturnal note. *Milton's Paradise Lost.*

Then to the desert takes his night;
Where still from *shade* to *shade* the Son of God,
After forty days fasting, had remained. *Milton.*

Leave not the faithful side
That gave thee being, still *shades* thee and protects. *Id.*

The portal shone, inimitable on earth
By model, or by *shading* pencil drawn. *Id.*

If substance might be call'd that *shadow* seemed. *Id.*

Without the least impulse or *shadow* of fate. *Id.*

Thou my *shadow*

Inseparable must with me be long. *Id.*

Types and *shadows* of that destined seed. *Id.*

Whereat I waked, and found

Before mine eyes all real, as the dream

Had lively *shadowed*. *Id. Paradise Lost.*

More pleasant light

Shadowy sets off the face of things. *Milton.*

The weaker light unwillingly declined,

And to prevailing *shades* the murmuring world resigned. *Roscommon.*

By the revolution of the skies

Night's sable *shadows* from the ocean rise. *Denham.*

Amongst the creatures are particular excellencies

scattered, which are some *shadows* of the divine perfections. *Tillotson.*

Stretched at ease you sing your happy loves,

And Amaryllis fills the *shady* groves. *Dryden.*

And, after these, came armed with spear and shield

An host so great as covered all the field;

And all their foreheads, like the knights before,

With laurels ever green were *shaded* o'er. *Id.*

'Tis every painter's art to hide from sight,

And cast in *shades*, what seen would not delight. *Id.*

To Tranchin, swift as thought, the fitting *shade*

Thro' air his momentary journey made. *Id.*

To the secret *shadows* I retire,

To pay my penance till my years expire. *Id.*

After great lights there must be great *shadows*. *Id.*

If the parts be too much distant, so that there be

void spaces which are deeply *shadowed*, then place in

those voids some fold, to make a joining of the parts.

Id. Dufresnoy.

Augustus is *shadowed* in the person of *Aeneas*

Dryden.

White, red, yellow, blue, with their several degrees

or *shades* and mixtures, as green, come in only by the

eyes. *Locke.*

The body, though it moves, yet, not changing per-

ceivable distance with some other bodies, the thing

seems to stand still, as in the hands of clocks, and

shadows of sun-dials. *Id.*

From a round globe of any uniform color, the

idea imprinted on our minds is of a flat circle, va-

riously *shadowed* with different degrees of light

coming to our eyes. *Id.*

His countrymen probably lived within the shake

of the earthquake, and *shadow* of the eclipse.

Addison.

Milton has brought into his poems two actors of

a *shadowy* and fictitious nature, in the persons of sin

and death; by which he hath interwoven in his fable

a very beautiful allegory. *Id.*

The shield being to defend the body from weapons,

21 *ly shadows* out to us the continence of the empe-

K

For, which made him proof to all the attacks of pleasure.
Id.

With shadowy verdure flourished high,
A sudden youth the groves enjoy. *Fenton.*

In Brazil are trees which 'll those that sit under
their shade in a few hours. *Arbutnot.*

Ne'er to these chambers, where the mighty rest,
Since their foundation came a nobler guest :

Nor e'er was to the bowers of bliss conveyed
A fairer spirit or more welcome shade. *Tickel.*

Envy will merit, as its shade, pursue. *Pope.*

Sing, while beside the shaded tomb I mourn,
And with fresh bays her rural shrine adorn. *Id.*

Let the arched knife,

Well sharpened, now assail the spreading shades
Of vegetables, and their thirsty limbs dis sever.

Philips.

SHADOW, in optics, is a privation or diminution of light by the interposition of an opaque body ; or it is a plane where the light is either altogether obstructed, or greatly weakened, by the interposition of some opaque body between it and the luminary.

SHADOW, in painting, is an imitation of a real shadow, effected by gradually heightening and darkening the colors of such figures as by their dispositions cannot receive any direct rays from the luminary that is supposed to enlighten the piece.

SHADOW, in perspective, the appearance of an opaque body, and a luminous one, whose rays diverge (e. gr. a candle, lamp, &c.), being given, to find the just appearance of the shadow, according to the laws of perspective. The method is this :—From the luminous body, which is here considered as a point, let fall a perpendicular to the perspective plane or table ; i. e. find the appearance of a point upon which a perpendicular, drawn from the middle of the luminary, falls on the perspective plane ; and from the several angles, or raised points of the body, let fall perpendiculars to the plane. These points, whereon the perpendiculars fall, connect by right lines with the point upon which the perpendicular let fall from the luminary falls ; and continues the lines to the side opposite to the luminary. Lastly, through the raised points, draw lines through the centre of the luminary, intersecting the former ; the points of intersection are the terms or bounds of the shadow.

SHADOWS, colored, a curious optical phenomenon, which was observed, a considerable number of years ago, by professor Scherffler of Vienna, and more lately by count Rumford. The count made the discovery when prosecuting his experiments upon light : of which the reader will find some account under PHOTOMETER. 'Desirous,' says he, 'of comparing the intensity of the light of a clear blue sky by day with that of a common wax-candle, I darkened my room, and letting the day-light from the north, coming through a hole near the top of the window-shutter, fall at an angle of about 70° upon a sheet of very fine white paper, I placed a burning wax-candle in such a position that its rays fell upon the same paper, and, as near as I could guess, in the line of reflection of the rays of day-light from without ; when, interposing a cylinder of wood, about half an inch in diameter, before the centre of the paper, and at the distance of about

two inches from its surface, I was much surprised to find that the two shadows projected by the cylinder upon the paper, instead of being merely shades without color, as I expected ; the one of them, that which, corresponding with the beam of day-light, was illuminated by the light of the most beautiful blue that is possible to imagine. This appearance, which was not only unexpected, but was really in itself in the highest degree striking and beautiful, I found upon repeated trials, and after varying the experiment in every way I could think of, to be so perfectly permanent, that it is absolutely impossible to produce two shadows at the same time, from the same body, the one answering to a beam of day-light, and the other to the light of a candle or lamp, without these shadows being colored, the one yellow, and the other blue. If the candle be brought nearer to the paper, the blue shadow will become of a deeper hue and the yellow shadow will gradually grow fainter ; but, if it be removed farther off, the yellow shadow will become of a deeper color, and the blue shadow will become fainter ; and, the candle remaining stationary in the same place, the same varieties in the strength of the tints of the colored shadows may be produced merely by opening the window-shutter a little more or less, and rendering the illumination of the paper, by the light from without, stronger or weaker. By either of these means, the colored shadows may be made to pass through all the gradations of shade, from the deepest to the lightest, and vice versâ ; and it is very amusing to see shadows thus glowing with all the brilliancy of the purest and most intense prismatic colors, then passing suddenly all the varieties of shade, preserving in all the most perfect purity of tint, growing stronger and fainter, and vanishing and returning, at command.'

SHADRACH, MESHACH, AND ABERNAGO, names given by the prince of the Babylonian eunuchs to the three captive Jewish princes, Hananiah, Mishael, and Azariah, the companions of Daniel. Their temperance, wisdom, and promotion along with Daniel ; their heroic refusal to worship Nebuchadnezzar's golden image ; and their miraculous deliverance from the fiery furnace, with the appearance of the Messiah, the destruction of their enemies, and subsequent promotion over the province, are recorded in Daniel, ch. i. and iii.

SHADWELL (Thomas), an English poet, descended of an ancient family in Staffordshire, born in 1640, and educated at Caius College, Cambridge. He then was placed in the Middle Temple to study the law ; where having spent some time, he travelled abroad. Upon his return home he became acquainted with the most celebrated persons of wit in that age. He applied himself chiefly to dramatic writing, in which he had great success ; and upon the Revolution was made poet laureat and historiographer to William and Mary, in the room of Mr. Dryden. These employments he enjoyed till his death, in 1692. The chief of his poetical pieces are his congratulatory poem on the prince of Orange's coming to England ; another on queen Mary ; his translation of Juvenal's tenth satire, &c. Mr.

Dryden treats him with great contempt, in his satire called *Mac-Fleckno*. The best judges of that age, however, gave their testimony in favor of his comedies; which have in them fine strokes of humor; the characters are often original, strongly marked, and well sustained. An edition of his works, with his life prefixed, was published in 1720, in 4 vols. 8vo.

SHADWELL, (Charles), the younger son of the poet, according to Chetwood, or his nephew, as Jacob has it, turned out a dramatic writer of considerable talents in Ireland. He wrote a good number of plays, but the piece he is most famed for is *The Fair Quaker of Deal*. He died in 1726.

SHAFT, *n. s.* Sax. *ƿceaf*. An arrow; a missive weapon; a narrow, deep pit.

To pierce pursuing shield,
By parents trained, the Tartars wild are taught,
With *shafts* shot out from their back-turned bow.

Sidney.

They sink a *shaft* or pit of six foot in length.

Carw.

Practise to draw small and easy things, as a cherry with the leaf, the *shaft* of a steeple.

Peacham.

Who, in the spring, from the new sun
Already has a fever got,

Too late begins those *shafts* to shun
Which Phœbus through his veins has shot.

Waller.

They are both the archer and *shaft* taking aim afar off, and then shooting themselves directly upon the desired mark.

More.

No lofty was the pile, a Parthian bow
With vigour drawn must send the *shaft* below.

Dryden.

The fulminating damp, upon its ascension, gives a crack like the report of a gun, and makes an explosion so forcible as to kill the miners, and force bodies of great weight from the bottom of the pit up through the *shaft*.

Woodward.

Suppose a tube, or, as the miners call it, a *shaft* were sunk from the surface of the earth to the center.

Arbutnot.

SHAFT, in mining. In the tin-mines, after this is sunk about a fathom, they leave a little, long, square place, which is called a shamble. Shafts are sunk some ten, some twenty fathoms, deep into the earth, more or less. Of these shafts there is the landing or working shaft, where they bring up the work or ore to the surface; but, if it be worked by a horse engine or whim, it is called a whim shaft; and, where the water is drawn out of the mine, it is indifferently named an engine-shaft, or the rod shaft. See **MINE**.

SHAFT, in ornithology. See **TROCHILUS**.

SHAFT OF A COLUMN, in building, is the body thereof between the base and capital; so called from its straightness. See **ARCHITECTURE**.

SHAFTESBURY, a borough and market-town, in Redland hundred, Sherborne division, Dorset, situate on a high hill, ten miles north from Blandford, and 101 W. S. W. from London. It is supposed by Camden to have been founded by Alfred; and is recorded to have been a populous city, and to have had twelve churches before the conquest: four only of which now remain; viz. St. Peter's, the Holy Trinity, St. James's, and St. Rumbold's, of which St. Peter's is the principal. This place sends one member to the imperial parliament. Here

are also meeting-houses, a free-school, and two alms-houses. In the corn market is a neat town-hall, in which the quarter sessions are held. Water is so scarce here that the inhabitants used to be supplied with it from Melcomb, an adjacent village. Latterly, two deep wells have been dug which afford plenty of good water.

SHAG, *n. s.* Saxon *ƿceacga*. Rough

SHAG'GED, *adj.* } woolly hair; rough; rug-
SHAG'GY, *adj.* } ged.

Where is your husband?

He's a traitor.

—Thou lvest, thou *shag*-eared villain! *Shakspeare.*

They plucked the seated hills with all their load,
Rocks, waters, woods; and by the *shaggy* tops
Uplifting, bore them in their hands.

Milton's Paradise Lost.

There, where very desolation dwells,

By grots and caverns *shagged* with horrid shade,

She may pass on with unblemished majesty,

Be it not done in pride.

Milton.

They change their hue, with haggard eyes they stare,

Lean are their looks, and *shagged* is their hair.

Dryden.

A lion's hide he wears;

About his shoulders hangs the *shaggy* skin,

The teeth and gaping jaws severely grin.

Id.

From the *shag* of his body, the shape of his legs, his having little or no tail, the slowness of his gait, and his climbing up of trees, he seems to come near the bear kind.

Grew.

How would the old king smile

To see you weigh the paws when tipt with gold,

And throw the *shaggy* spoils about your shoulders.

Addison.

True Witney broad cloth, with its *shag* unshorn,

Be this the horseman's fence.

Gay.

Ye rugged rocks! which holy knees have worn;

Ye grots and caverns *shagged* with horrid thorn!

Pope.

From the frosty north,

The early valiant Swede draws forth his wings

In battailous array, while Volga's stream

Sends opposite, in *shaggy* armour clad,

Her borderers, on mutual slaughter bent.

Philips.

As yet black breeches were not; satin smooth,

Or velvet soft, or plush with *shaggy* pile.

Cowper.

SHAG, *n. s.* Lat. *phalacrocorax*. A sea-bird.

Among the first sort we reckon *shags*, duck, and mallard.

Carew.

SHAGREEN, or **CHAGREEN**, in commerce, a kind of grained leather prepared of the skin of a species of squalus, much used in covering cases, books, &c. Shagreen is also made of the skin of the onager, or wild ass, as well as of horses; of the part that covers the rump. There are great manufactures of it at Astracan, and in all Persia.

Professor Pallas says that no accurate account of the method of preparing shagreen has ever been published in Europe previous to his own; of which we now give an abridgment:—'All kinds of horses or asses skin, which have been dressed so as to appear grained, are, by the Tartars, called sauwer, by the Persians sogre, and by the Turks sagri, from which the Europeans have made shagreen or chagrin. The Tartars who reside at Astracan, with a few of the Armenians of that city, are the only people in the Russian empire acquainted with the art of mak-

ing shagreen. Those who follow this occupation not only gain considerable profit by the sale of their production to the Tartars of Cuban, Astracan, and Casan, who ornament with it their Turkey leather boots, slippers, and other articles made of leather, but they derive considerable advantage from the great sale of horses' hides, which have undergone no other process than that of being scraped clean, and of which several thousands are annually exported, at the rate of from seventy-five to eighty-five roubles per 100, to Persia, where there is a scarcity of such hides, and from which the greater part of the shagreen manufactured in that country is prepared. The hind part only of the hide, however, which is cut out in the form of a crescent about a Russian ell and a half in length across the loins, and a short ell in breadth along the back, can properly be employed for shagreen. The remaining part is improper for that purpose, and is therefore rejected. The preparation of the skins, after being cut into the above form, is as follows:—They are deposited in a tub filled with pure water, and suffered to remain there for several days, till they are thoroughly soaked, and the hair has dropped off. They are then taken from the tub, one by one, extended on boards placed in an oblique direction against a wall, the corners of them, which reach beyond the edges of the board, being made fast, and the hair with the epidermis is then scraped off with a blunt iron scraper called *urak*. The skins thus cleaned are again put in pure water to soak. They are then taken from the water a second time, spread out as before, and carefully scraped on both sides. They then take frames, made of a straight and a semicircular piece of wood, having nearly the same form as the skins. On these the skins are extended in as even a manner as possible by cords; and, while extending them, they are several times besprinkled with water, again moistened, and carried into the house, where the frames are deposited close to each other on the floor with the flesh side next the ground. The upper side is then thickly bestrewed with the black, smooth, and hard seeds of a kind of goose foot (*chenopodium album*), and, that they may make a strong impression on the skins, a piece of felt is spread over them, and the seeds are trod down with the feet, and thus deeply imprinted into the soft skins. The frames, without shaking the seeds, are then carried out into the open air, and placed in a reclining position against a wall to dry. In this state the skins are left several days to dry in the sun, until no moisture is observed in them, when they are fit to be taken from the frames. When the impressed seeds are beat off from the hair side, it appears full of indentations or inequalities, and has acquired that impression which produces the grain of the shagreen. The operation of smoothing is performed on an inclined bench or board, which is furnished with an iron hook, and is covered with thick felt of sheep's wool, on which the dry skin may gently rest. The skin is suspended in the middle of the bench to its iron hook, by one of the holes made in the edge of the skin for extending it in its frame as before mentioned; and a cord, having

at its extremity a weight, is attached to each end of the skin, to keep it in its position while under the hands of the workman. It is then smoothed and scraped by two different instruments. The first is a piece of sharp iron bent like a hook, with which the surface is pretty closely scraped to remove all the projecting inequalities. This operation, from the hardness of the skin, is attended with difficulty; and great caution is required that too much of the impression of the alabuta seed be not destroyed. After all these operations, the shagreen is again put into water, partly to make it pliable, and partly to raise the grain. As the seeds occasion indentations in the surface of the skin, the intermediate spaces, by the operations of smoothing and scraping, lose some part of their projecting substance; but the parts which have been depressed, and which have lost none of their substance, now swell up above the scraped parts, and thus form the grain of the shagreen. To produce this effect the skins are left to soak in water for twenty-four hours; after which they are immersed several times in a strong warm ley, obtained by boiling from a strong alkaline earth named *schora*, which is found in great abundance in the neighbourhood of Astracan. When the skins have been taken from this ley they are piled up, while warm, on each other and suffered to remain in that state several hours; by which means they swell and become soft. They are then left twenty-four hours in a moderately strong pickle of common salt, which renders them exceedingly white and beautiful, and fit for receiving any color. The color most usual for these skins is a sea-green; but old experienced workmen can dye them blue, red, or black, and even make white shagreen. For the green color nothing is necessary but filings of copper and sal ammoniac. Sal ammoniac is dissolved in water till the water is completely saturated; and the shagreen skins, still moist, after being taken from the pickle, are washed over with the solution on the ungrained flesh side, and, when well moistened, a thick layer of copper filings is strewed over them: the skins are then folded double, so that the side covered with the filings is innermost. Each skin is then rolled up in a piece of felt; the rolls are all ranged together in proper order, and they are pressed down by some heavy bodies placed over them, under which they remain twenty-four hours, after which the skins are spread out and dried. For the blue dye indigo is used. About two pounds of it, reduced to a fine powder, are put into a kettle: cold water is poured over it, and the mixture is stirred round till the color begins to be dissolved; five pounds of pounded alakar, which is a kind of barilla or crude soda, are then dissolved in it, with two pounds of lime and one pound of pure honey, and the whole is kept several days in the sun, and often stirred round. The skins intended to be dyed blue must be moistened only in the nutritious ley *schora*, but not in the salt brine. When still moist they are folded up and sewed together at the edge, the flesh side being innermost, and the shagreened hair side outwards; after which they are dipped three times in the remains of an exhausted kettle of the same dye, the superfluous

dye being each time expressed; and, after this process, they are dipped in the fresh dye prepared as above, which must not be expressed. The skins are then hung up in the shade to dry; after which they are cleaned and paired. For black shagreen gall-nuts and vitriol are employed. The skins, moist from the pickle, are thickly bestrewed with finely pulverised gall-nuts. They are then folded and laid over each other twenty-four hours. A new ley, of bitter saline earth or schora, is prepared and poured hot into small troughs. In this ley each skin is several times dipped; after which they are again bestrewed with pounded gall-nuts, and placed in heaps for a certain period, that the galls may thoroughly penetrate them, and they are dried and beat to free them from the dust of the galls. They are then rubbed over, on the shagreen side, with melted sheep's tallow, and exposed a little in the sun, that they may imbibe the grease. The shagreen makers roll up each skin separately and squeeze it with their hands to promote the absorption of the tallow. The superfluous particles are removed by a blunt wooden scraper; and, when the skins have lain some time, a sufficient quantity of vitriol of iron is dissolved in water, with which the shagreen is moistened on both sides, and thus acquires a beautiful black dye. To obtain white shagreen the skins must first be moistened on the shagreen side with a strong solution of alum. When the skin has imbibed this liquor it is daubed over on both sides with a paste made of flour which is suffered to dry. The paste is then washed off with alum water, and the skin is placed in the sun till it is completely dry. As soon as it is dry it is gently besmeared with pure melted sheep's tallow, which it is suffered to imbibe in the sun; and, to promote the effect, it is pressed and worked with the hands. The skins are then fastened in succession to the before-mentioned bench, where warm water is poured over them, and the superfluous fat is scraped off with a blunt wooden instrument. Shagreen perfectly white is thus obtained, and nothing remains but to pare the edges and dress it. But this white shagreen is not intended so much for remaining in that state as for receiving a dark red dye; because, by the above previous process, the color becomes much more perfect. The skins destined for a red color, after they have been whitened, must be left to soak in the pickle for twenty-four hours. The dye is prepared from cochineal. About a pound of the dried herb *tschagann*, which grows in great abundance near Astracan, and is a kind of soda plant or kali (*salsola ericoides*) is boiled a full hour in a kettle containing about four common pailfuls of water; by which means the water acquires a greenish color. The herb is then taken out, and about half-a-pound of pounded cochineal is put into the kettle, and the liquor is left to boil a full hour. About fifteen or twenty drachms of orchilla is added, and, when the liquor has been boiled for some time longer, the kettle is removed from the fire. The skins taken from the pickle are then placed over each other in troughs; and the dye liquor is poured over them four different times, and rubbed into them with the hands, that the color may be equally

imbibed and diffused. The liquor each time is expressed: after which they are fit for being dried. Skins prepared in this manner are sold at a much dearer rate than any of the other kinds.'

SHAHABAD, a large fertile district of the province of Bahar, Hindostan; it is advantageously situated between the rivers Soane and Ganges, as they approach their confluence. It is estimated to contain a million of inhabitants, in the proportion of nineteen Hindoos to one Mahometan. Its towns are Chunar, Boujepore, and Arrah. It constitutes one of the British Bahar collectorships, and is governed by a judge, who is amenable to the circuit court of Patna. Its capital is Arrah.

SHAHJEHANPORE, a town of Hindostan, in the province of Delhi, and district of Bareilly, on the east side of the Gurrah River. Long. $79^{\circ} 53'$ E., lat. $27^{\circ} 51'$ N.

SHAHJEHANPORE, a town of Hindostan, province of Malwah, on the banks of the Sagor-mutty River, belonging to the Mahrattas. It is a place of consequence, being the capital of a district. Long. $76^{\circ} 18'$ E., lat. $23^{\circ} 38'$ N. There are several other places of the same name, called after the emperor Shah Jehan.

SHAHNOOR, **SANORE**, or **SEVANOOR**, an extensive district of Hindostan, province of Bejapore, belonging to the Mahrattas. It is situated between the Kistna and Tungbudra, and lat. 15° N. The country is fertile and under a good government would be very productive.

SHAHNOOR, **SANORE**, **SEVANOOR**, or **SAVANOOR**, a city of Hindostan, the ruined capital of the above-mentioned district. It was formerly fortified, contained a palace and many good buildings, and is said to have been taken by the Mahometans so early as the year 1397. In the course of time it became the capital of one of the many nabobs who arose into power on the decline of the empire of Delhi. The first who is mentioned is the person who attended the Nizam Nasir Jung, when he entered the Carnatic in 1749, and in the following year took a part in the mutiny which cost Nasir Jung his life; in the year 1751 he was himself killed in a second rebellion. The successor of this nabob seems to have sought protection from the Mahrattas against the viceroy; for in 1756 a French army, in the service of the Nizam Salbut Jung, advanced to Sevanore, to exact the tribute due from the nabob; but, by the intrigues of the Mahratta chief, Morari Row, this object was defeated. In 1763 Hyder Aly sent to the nabob of Shahnoor, soliciting his alliance, and that of the two other Afghaun nabobs of Cuddapah and Kurnoul, against the Mahrattas; but, the former having rejected the overture, Hyder invaded his dominions, totally defeated him in a general engagement, and compelled him to submit to humiliating terms. Subsequently his country was invaded by the Mahrattas, who took permanent possession of one half of his dominions. In 1779 Hyder compelled the nabob to enter into a double marriage with his family, the nabob taking Hyder's sister for wife, and giving his daughter to Kereem Sahib, the second son of Hyder. This, however, could not save the nabob from the merciless treatment of Tippoo Sultan, who, in 1786, took

Shahnoor, plundered it of every thing valuable, and forced the nabob to take refuge with the Mahrattas. At the conclusion of the war Shahnoor was included in the portion of territory assigned to the Mahrattas.

SHAIL, *v. n.* Belg. and Teut. *schail*. To walk sideways. A low word.

Child, you must walk straight, without skewing and *shailing* to every step you set. *L'Estrange*.

SHAKE, *v. a., v. n., & n. s.* } Saxon *ſceacan*; }
SHA'KER, *n. s.* } Swedish *shaka*;
Goth. *ſkeaka*. To agitate; make to tremble or totter, or to throw down by violent motion; to drive off; drive away by such motion; sometimes taking off: to be agitated, driven, &c., in this way; be in terror: and, as a noun substantive, the concussion or motion produced: shaker corresponding.

I will *shake* mine hand upon them, and they shall be a spoil to their servants. *Zech. ii. 9.*

The stars fell unto the earth, even as a fig-tree casteth her untimely figs when she is *shaken* of a mighty wind. *Rev. vi.*

When ye depart, *shake* off the dust of your feet. *Matt. x.*

Who honours not his father,
Henry the fifth, that made all France to quake,
Shake he his weapon at us, and pass by. *Shakspeare*.

Macbeth is ripe for *shaking*, and the powers above
Put on their instruments. *Id.*

The tyrannous breathing of the north
Shakes all her buds from blowing. *Id.*

A sly and constant knave, not to be *shak'd*.
Id. Cymbeline.

This respite *shook*
The bosom of my conscience. *Id. Henry VIII.*

With the slave
He ne'er *shook* hands, nor bid farewell to him,
Till he unseamed him from the nape to th' chops.
Shakspeare.

Be pleased that I *shake* off these names you give me:

Antonio never yet was thief or pirate. *Id.*

Thy sight, which should
Make our eyes flow with joy, hearts dance with comforts,
Constrains them weep, and *shake* with fear and sorrow. *Id.*

~ If that thy fame with every toy be pos'd,
'Tis a thin web, which poisonous fancies make;

But the great soldier's honour was compos'd
Of thicker stuff, which could endure a *shake*:
Wisdom picks friends; civility plays the rest,
A toy, shunn'd cleanly, passeth with the best.

Herbert.

The rapid wheels *shake* heaven's basis.
Under his burning wheels
The stedfast empyrean *shook* throughout,
All but the throne itself of God. *Id.*

Go, then, the guilty at thy will chastise:
He said; the *shaker* of the earth replies.

Pope's Odyssey.

SHAKERS, or SHAKING QUAKERS, a sect which arose at Manchester, in England, about 1747, and has since been transferred to America, where it now consists of a number of thriving families. The founders were a number of ob-

scure Quakers; and the Shakers still agree with the Friends in their rejection of the civil and ecclesiastical authority, and military service, in their objection to taking oaths, their neglect of the common courtesies of society, their rejection of the sacraments, and their belief in the immediate revelations of the Holy Ghost (gifts). At first, the motions from which they derive their name were of the most violent, wild, and irregular nature—leaping, shouting, clapping their hands, &c.; but at present, they move in a regular, uniform dance, to the singing of a hymn, and march round the hall of worship, clapping their hands in regular time. There are at present fifteen families, as their communities are called, in the United States, comprising 6000 individuals. In these communities, the property is held in common, and the members are distinguished for their industry, frugality, honesty, and good morals. Celibacy is enjoined, and their numbers are recruited by converts. The office of leader is bestowed by impulse or revelation on him who has the gift to assume it. The sect of Shakers was first introduced into America by Anne Lee, who, in 1770, became their leader. She was born at Manchester, in 1736, and was the daughter of a blacksmith of Manchester, where she also, at an early age, became the wife of a blacksmith. Her first "testimony of salvation and eternal life," borne in 1770, was the injunction of celibacy as the perfection of human nature, and the holding forth herself as a divine person. She was from this time honored with the title of "mother Anne," and she styled herself "Anne the world." Having been persecuted in England, she went out to America in 1774, with several members of the society, and formed the first community at Watervliet, near Albany, where she died in 1784. Societies were soon organized at New Lebanon, in New York, and at Enfield, in Connecticut, and have gradually increased to their present number.

SHAKSPEARE, or SHAKESPEARE (William), the prince of dramatic writers, was born at Stratford-upon-Avon, in Warwickshire, on the 23d of April, 1564. From the register of that town it appears that a plague broke out there on the 30th of June following, which raged with great violence; but fortunately it did not reach the house in which this infant prodigy lay. His father, John Shakspeare, enjoyed a small patrimonial estate, and was a considerable dealer in wool; his mother was the daughter and heir of Robert Arden, of Wellingcote. Our illustrious poet, being designed for the business of his father, received no better education than the master of the free-school of Stratford could afford. After applying some time to the study of Latin, he was called home to assist his father, who seems to have been reduced in his circumstances. Before he was nineteen he married the daughter of Mr. Hathaway, a substantial yeoman near Stratford. This lady was eight years older than her husband. Having fallen into bad company, he was seduced into some profligate actions, which drew on him a criminal prosecution, and at length forced him to take refuge in the capital. In concert with his associates he broke into a park

belonging to Sir Thomas Lucy of Charlecote, and carried off some deer of his. If any thing can extenuate his guilt in this it must be the opinions of the age. One thing is certain, that Shakspeare thought the crime venial, and that the prosecution which Sir Thomas raised against him was carried on with great severity. Shakspeare testified his resentment against Lucy by writing a satirical ballad, which exasperated him so much that the process was carried on with redoubled violence; and the young poet, to avoid the punishment of the law, was obliged to fly. Of this ballad tradition has only preserved the first stanza:—

A parliament member, a justice of peace,
At home a poor scare-crow, at London an asse.
If lowsie is Lucy, as some volke miscalle it,
Then Lucy is lowsie whatever befall it:
He thinks himself great,
Yet an asse in his state,
We allowe by his ears but with asses to mate.
If Lucy is lowsie, as some volke miscalle it,
Sing lowsie Lucy whatever befall it.

If the rest of the ballad were of a piece with this stanza, it might assist us to form some opinion of the irritability of the baronet, but could convey no idea of the opening genius of Shakspeare. Thus expelled from his native village, he repaired to London, where he was glad to accept a subordinate office in the theatre. It has been said that he was first engaged, while the play was acting, in holding the horses of those who rode to the theatre. As his name is found printed among those of the other players, before some old plays, it is probable that he was some time employed as an actor; but we are only told that the part which he acted best was that of the Ghost in Hamlet; and that he appeared in the character of Adam in *As You Like It*. In Ben Jonson's play of *Every Man in his Humor*, Shakspeare is said to have played the part of Old Knowell. See Malone's *Chronology*, in his edition of Shakspeare. But, though not qualified to shine as an actor, he was now in the situation which could most effectually rouse those latent sparks of genius which afterwards burst forth with so resplendent a flame. Being well acquainted with the mechanical business of the theatre and the taste of the times; possessed of a knowledge of the characters of men resembling intuition, an imagination that ranged at large through nature, selecting the grand, the sublime, and the beautiful; a judicious caution, that disposed him to prefer those plots which had already been found to please; an uncommon fluency and force of expression; he was qualified at once to eclipse all who had gone before him. Notwithstanding the unrivalled genius of Shakspeare, most of his plots were the invention of others, which, however, he certainly much improved, if he did not entirely new-model. Among his patrons, the earl of Southampton is particularly honored by him, in the dedication of two poems, *Venus and Adonis*, and *Lucrece*; in the latter, especially, he expressed himself in such terms as gives countenance to what is related of that patron's distinguished generosity to him. In the beginning of king James I.'s reign (if not sooner) he was one of the principal managers of the playhouse, and

continued in it several years afterwards; till, having acquired such a fortune as satisfied his moderate wishes and views in life, he quitted the stage, and all other business, and passed the remainder of his time in an honorable ease, at his native town of Stratford, where he lived in a handsome house of his own purchasing, to which he gave the name of New Place; and he had the good fortune to save it from the flames in the dreadful fire that consumed the greatest part of the town in 1614. In the beginning of 1616 he made his will, wherein he testified his respect to his quondam partners in the theatre; he appointed his youngest daughter, jointly with her husband, his executors, and bequeathed to them the best part of his estate, which they came into the possession of not long after. He died on the 23rd of April following, being the fifty-third year of his age; and was interred among his ancestors on the north side of the chancel, in the great church of Stratford, where there is a handsome monument erected for him, inscribed with the following elegiac distich in Latin:—

Judicio Pylum, genio Socratem, arte Maronem,
Terra tegit, Populus mœret, Olympus habet.

In 1740 another very noble one was raised to his memory at the public expense, in Westminster Abbey; an ample contribution for this purpose being made upon exhibiting his tragedy of *Julius Cæsar*, at the Theatre-Royal in Drury Lane, April 28th, 1738. A mulberry tree, planted upon his estate by his own hands, was cut down not many years ago; and the wood being converted to several domestic uses was all eagerly bought at a high price, and each single piece treasured up by its purchaser as a precious memorial of the planter. The character of Shakspeare as a dramatic writer has been often drawn, but perhaps never with more accuracy than by Dr. Johnson:—"Shakspeare," says he, "is, above all writers, at least above all modern writers, the poet of nature; the poet that holds up to his readers a faithful mirror of manners and of life. His characters are not modified by the customs of particular places, unpractised by the rest of the world; by the peculiarities of studies or professions, which can operate but upon small numbers; or by the accidents of transient fashions or temporary opinions; they are the genuine progeny of common humanity, such as the world will always supply, and observation will always find. His persons act and speak by the influence of those general passions and principles by which all minds are agitated, and the whole system of life is continued in motion. In the writings of other poets a character is too often an individual; in those of Shakspeare it is commonly a species. It is from this wide extension of design that so much instruction is derived. It is this which fills the plays of Shakspeare with practical axioms and domestic wisdom. It was said of Euripides that every verse was a precept; and it may be said of Shakspeare that from his works may be collected a system of civil and economical prudence. Yet his real power is not shown in the splendor of particular passages, but by the progress of his fable, and the tenor of his dialogue; and he that tries to recommend him, by select quotations,

will succeed like the pedant in Hierocles, who, when he offered his house to sale, carried a brick in his pocket as a specimen. Upon every other stage the universal agent is love, by whose power all good and evil is distributed, and every action quickened or retarded. But love is only one of many passions; and, as it has no great influence upon the sum of life, it has little operation in the dramas of a poet who caught his ideas from the living world, and exhibited only what he saw before him. He knew that any other passion, as it was regular or exorbitant, was a cause of happiness or calamity. Characters thus ample and general were not easily discriminated and preserved; yet perhaps no poet ever kept his personages more distinct from each other. Other dramatists can only gain attention by hyperbolic or aggravated characters, by fabulous and unexampled excellence or depravity, as the writers of barbarous romances invigorated the reader by a giant and a dwarf; and he that should form his expectations of human affairs from the play, or from the tale, would be equally deceived. Shakspeare has no heroes; his scenes are occupied only by men, who act and speak as the reader thinks that he should himself have spoken or acted on the same occasion: even where the agency is supernatural, the dialogue is level with life. Other writers disguise the most natural passions and most frequent incidents: so that he who contemplates them in the book will not know them in the world: Shakspeare approximates the remote, and familiarises the wonderful; the event which he represents will not happen, but, if it were possible, its effects would probably be such as he has assigned; and it may be said that he has not only shown human nature as it acts in real exigencies, but as it would be found in trials to which it cannot be exposed. This, therefore, is the praise of Shakspeare, that his drama is the mirror of life; that he who has mazed his imagination, in following the phantoms which other writers raise up before him, may here be cured of his delirious ecstasies, by reading human sentiments in human language; by scenes from which a hermit may estimate the transactions of the world, and a confessor predict the progress of the passions.' The learning of Shakspeare has frequently been a subject of enquiry. That he possessed much classical knowledge does not appear, yet he was certainly acquainted with the Latin poets, particularly with Terence, as Colman has justly remarked, which appears from his using the word *thrasonical*. Nor was he unacquainted with French and Italian. We are indeed told that the passages in which these languages occur might be impertinent additions of the players; but is it probable that any of the players so far surpassed Shakspeare? That much knowledge is scattered over his works is very justly observed by Pope; but it is often such knowledge as books did not supply. 'There is, however, proof enough,' says Dr. Johnson, 'that he was a very diligent reader; nor was our language then so indigent of books, but that he might very liberally indulge his curiosity without excursion into foreign literature. Many of the Roman authors were translated, and some of the Greek; the Reformation

had filled the kingdom with theological learning, most of the topics of human disquisition had found English writers; and poetry had been cultivated, not only with diligence, but success. This was a stock of knowledge sufficient for a mind so capable of appropriating and improving it.' The works of Shakspeare consist of thirty-five dramatic pieces. The following is the chronological order, which Mr. Malone has endeavoured to establish, after a minute investigation, in which he has in general been successful:—

1. First Part of King Henry VI.	1589
2. Second Part of King Henry VI.	1591
3. Third Part of King Henry VI.	1591
4. A Midsummer Night's Dream	1592
5. Comedy of Errors	1593
6. Taming of the Shrew	1594
7. Love's Labor Lost	1594
8. Two Gentlemen of Verona	1595
9. Romeo and Juliet	1595
10. Hamlet	1596
11. King John	1596
12. King Richard II.	1597
13. King Richard III.	1597
14. First Part of King Henry IV.	1597
15. Second Part of King Henry IV.	1598
16. The Merchant of Venice	1598
17. All's Well that Ends Well	1598
18. King Henry V.	1599
19. Much Ado About Nothing	1600
20. As You Like It	1600
21. Merry Wives of Windsor	1601
22. King Henry VIII.	1601
23. Troilus and Cressida	1602
24. Measure for Measure	1603
25. The Winter's Tale	1604
26. King Lear	1605
27. Cymbeline	1605
28. Macbeth	1606
29. Julius Cæsar	1607
30. Antony and Cleopatra	1608
31. Timon of Athens	1609
32. Coriolanus	1610
33. Othello	1611
34. The Tempest	1612
35. Twelfth Night	1614

The first three of these, Mr. Malone thinks, there is very strong reason to believe are not the original productions of Shakspeare; but that he probably altered them, and added some new scenes. In the first folio edition, in 1623, these plays were entitled 'Mr. William Shakspeare's Comedies, Histories, and Tragedies.' They have been published by various editors. The first folio edition by Isaac Jaggard and Edward Blount; the second folio, 1632, by Thomas Cotes for Robert Allott; the third, 1664, for P. C.; the fourth, 1685, for H. Herringham, E. Brewster, and R. Bentley. Rowe published an 8vo. edition in 1709, in 7 vols, and a 12mo. edition in 1714 in 9 vols., for which he received £36 10s. Pope published a 4to. edition in 1725 in 6 vols., and a 12mo in 1728 in 10 vols., for which he was paid £217 12s. Theobald gave a new edition in 8vo. in 1733 in 7 vols., another in 12mo in 1740 in 8 vols., and received for his labor £625 10s. Sir Thomas Hanmer published

an edition in 1744 in 6 vols. 4to. Dr. Warburton's 8vo. edition came out in 1747 in 8 vols., for which he was paid £560. The editions published since that time are Dr. Johnson's in 1765 in 8 vols. 8vo.; Steven's in 1766 in 4 vols. 8vo.; Capell's in 1768 in 10 vols. crown 8vo., for this the author was paid £300. A second edition of Hanmer's in 1771 in 6 vols.; Johnson's and Stevens's in 1773 in 10 vols. 8vo.; a second edition in 1778; a third by Reed in 1785; and Malone's crown 8vo. edition in 1789 in 10 vols. The most authentic of the old editions is that of 1623. 'At last,' says Dr. Johnson, 'an edition was undertaken by Rowe; not because a poet was to be published by a poet, for Rowe seems to have thought very little on correction or explanation, but that our author's works might appear like those of his fraternity, with the appendages of a life and recommendatory preface. Rowe has been clamorously blamed for not performing what he did not undertake, and it is time that justice be done him, by confessing, that though he seems to have had no thought of correction beyond the printer's errors, yet he has made many emendations, if they were not made before, which his successors have received without acknowledgment, and which, if they had produced them, would have filled pages with censures of the stupidity by which the faults were committed, with displays of the absurdities which they involved, with ostentatious expositions of the new reading, and self-congratulations on the happiness of discovering it. The nation had been for many years content with Mr. Rowe's performance, when Mr. Pope made them acquainted with the true state of Shakspeare's text, showed that it was extremely corrupt, and gave reason to hope that there were means of reforming it. Mr. Pope's edition, however, he observes, fell below his own expectations; and he was so much offended, when he was found to have left any thing for others to do, that he passed the latter part of his life in a state of hostility with verbal criticisms. The only task, in the opinion of Mr. Malone, for which Pope was eminently and indisputably qualified, was to mark the faults and beauties of his author. When he undertook the office of a commentator, every anomaly of language, and every expression that was not currently in use, were considered as errors or corruptions, and the text was altered or amended, as it was called, at pleasure. Pope is openly charged with being one of the great corrupters of Shakspeare's text. Pope was succeeded by Theobald, who collated the ancient copies, and rectified many errors. He was, however, a man of narrow comprehension and of little learning; and, what is worse, in his reports of copies and editions, he is not to be trusted without examination. From the liberties taken by Pope, the edition of Theobald was justly preferred, because he professed to adhere to the ancient copies more strictly, and illustrated a few passages by extracts from the writers of our poet's age. Still, however, he was a considerable innovator; and, while a few arbitrary changes made by Pope were detected, innumerable sophistications were silently adopted. Sir Thomas Hanmer, who comes next, was a man of critical

abilities, and of extensive learning. His corrections are commonly just, but sometimes capricious. He is censurable, too, for receiving without examination almost all the innovations of Pope. The original and predominant error of Warburton's commentary is acquiescence in his first thoughts; that precipitation which is produced by consciousness of quick discernment; and that confidence which presumes to do, by surveying the surface, what labor only can perform by penetrating to the bottom. His notes exhibit sometimes perverse interpretations, and sometimes improbable conjectures; he at one time gives the author more profundity of meaning than the sentence admits, and at another discovers absurdities where the sense is plain to every other reader. But his emendations are likewise often happy and just; and his interpretation of obscure passages learned and sagacious. It has indeed been said by his defenders, that his great object was to display his own learning; and certainly, in spite of the clamor raised against him for substituting his own chimerical conceits instead of the genuine text of Shakspeare, his work increased his reputation. But as it is of little value as a commentary on Shakspeare, since Warburton is now gone, his work will probably sink into oblivion. In 1765 Dr. Johnson's edition, which had long been impatiently expected, was given to the public. His vigorous and comprehensive understanding threw more light on his author than all his predecessors had done. The character which he gave of each play is generally just. His refutation of the false glosses of Theobald and Warburton, and his numerous explications of involved and difficult passages, entitle him to the gratitude of every admirer of Shakspeare. The last editor is Mr. Malone, who was eight years employed in preparing his edition. By collating the most authentic copies, he has been careful to purify the text. He has been so industrious to discover the meaning of the author, that he has ransacked many volumes, and trusts that, besides his additional illustrations, not a single valuable explication of any obscure passage in these plays has ever appeared which he has not inserted in his edition. He rejects Titus Andronicus, as well as the three plays formerly mentioned, as not being the authentic productions of Shakspeare. To the whole he has added an appendix, and a copious glossary. Of this work a less expensive edition has been published in 7 vols. 12mo., in which the general introductory observations prefixed to the different plays are preserved, and the numerous notes abridged. This judicious commentator has certainly done more for the elucidation and correction of Shakspeare than all who came before him, and has followed with indefatigable patience the only road which a commentator of Shakspeare ought to observe. Within fifty years after our poet's death, Dryden says that he was become 'a little obsolete;' and in the beginning of the eighteenth century lord Shaftesbury complains of his rude unpolished style, and his antiquated phrase and wit. These complaints were owing to the great revolution which the English language has undergone, and to the want of an enlightened com-

mentator. These complaints are now removed, for an enlightened commentator has been found in Mr. Malone. In 1790 a copious index to the remarkable passages and words in the plays of Shakspeare was published by the Rev. Mr. Ayscough, a gentleman to whom the literary world is much indebted for several very valuable keys of knowledge. In fine, the admirers of Shakspeare are now furnished with every help that can enable them to understand the sense and to taste the beauties of this illustrious poet.

SHALE, *n. s.* Sax. *scala*. A husk; the case of seeds in siliquous plants.

Behold you poor and starved band,
And your fair shew shall suck away their souls,
Leaving them but the *shales* and husks of men.

Shakspeare.

SHALE, in the old system of mineralogy, a species of schistus. It is a black slaty substance, or a clay hardened into a stony consistence, and so much impregnated with bitumen that it becomes somewhat like coal. The acid emitted from shale, during its calcination, uniting itself to the argillaceous earth of the shale, forms alum. About 120 tons of calcined shale will make one ton of alum. The shale, after being calcined, is steeped in water, by which means the alum, which is formed during the calcination of the shale, is dissolved: this dissolved alum undergoes various operations before it is formed into the alum of the shops. Watson's Chemical Essays, vol. ii. p. 315. See **ALUM**. This kind of slate forms large strata in Derbyshire. It is found in large strata, generally above the coal, in most coal counties of this kingdom. Dr. Short says that the shale wastes the lead ore near it, by its strong acid; and that it corrodes and destroys all minerals near it, except iron or coal, of whose vitriol it partakes.

SHALL, *verb defect.* Sax. *scéal*. I owe, or I ought. In Chaucer, the faith I shall to God, means the faith I owe to God: thence it became a sign of the future tense. It has no tenses but shall future, and should imperfect.

It is a mind that *shall* remain.
—*Shall* remain!

Hear you this triton of the minnows? Mark you
An absolute *shall*? *Shakspeare. Coriolanus.*

Some praises come of good wishes and respects, when, by telling men what they are, they represent to them what they *should* be. *Bacon.*

There is a fabulous narration that in the northern countries there *should* be an herb that groweth in the likeness of a lamb, and feedeth upon the grass.

Bacon's Natural History.

Let not a desperate action more engage you
Than safety *should*. *Ben Jonson's Catiline.*

That he *shall* receive no benefit from Christ is the affirmation where all his despair is founded: and the one way of removing this dismal apprehension is, to convince him that Christ's death, and the benefits thereof, either do, or, if he perform the condition required of him, *shall* certainly belong to him.

Hammond's Fundamentals.

To do thee honour I will shed their blood,
Which the just laws, if I were faultless, *should*.

Waller.

See Romulus the great:
This prince a priestess of your blood *shall* bear;
And, like his sire, in arms he *shall* appear.

Dryden's Æneid.

So subjects love just kings, or so they *should*.

Dryden.

The girls look upon their father as a clown, and the boys think their mother no better than she *should* be. *Addison.*

I conclude that tidings are not as they *should* be. *Swift.*

SHALLOON, *n. s.* From Chalons, in France. A slight woollen stuff.

In blue *shalloon* shall Hannibal be clad,
And Scipio trail an Irish purple plaid. *Swift.*

SHALLOP, *n. s.* Fr. *chaloupe*. A small boat.

You were resolved, after your arrival into Oroonoke, to pass to the mine; and, to that end, you desired to have Sir John Fearn's *shallop*: I do not allow of that course, because ye cannot land so secretly but that some Indians on the river side may discover you, who giving knowledge of your passage to the Spaniards, you may be cut off before you can recover your boat. *Raleigh.*

Our hero set

In a small *shallop*, fortune in his debt. *Waller.*

A **SHALLOP**, or **SLOOP**, is a small light vessel, with only a small main-mast, and fore-mast, and lug-sails, to hale up, and let down, on occasion. Shallops are commonly good sailers, and are therefore often used as tenders upon men of war.

SHALLOW, *adj. & n. s.* } Probably com-
SHALLOW'BRAIN, *adj.* } pounded of shoal
SHALLOW'LY, *adv.* } and low.—*Johnson.*
SHALLOW'NESS, *n. s.* } son. From Goth.
signu la, to sink low.—*Thomson.* Not deep; having the bottom at no great distance from the surface: not intellectually deep; not profound; not deep of sound: the noun substantive and adverb corresponding.

This is a very *shallow* monster,
Afraid of him? A very *shallow* monster,
The man i' th' moon! A most poor credulous monster. *Shakspeare.*

I had been drowned, but that the shore was shelvy and *shallow*; a death that I abhor.

Id. Merry Wives of Windsor.

I should not see the sandy hour-glass run,
But I should think of *shallows* and of flats;
And see my wealthy Andrew docked in sand,
Veiling her high top lower than her ribs,
To kiss her burial. *Id. Coriolanus.*

Most *shallowly* did you these arms commence,
Fondly brought here, and foolishly sent hence.

Shakspeare.

That inundation, though it were *shallow*, had a long continuance, whereby they of the vale, that were not drowned, perished for want of food.

Bacon.

The king was neither so *shallow* nor so ill advertised, as not to perceive the intention of the French king, for the investing himself of Britaigne.

Id. Henry VII.

A swift stream is not heard in the channel, but upon *shallows* of gravel. *Id. Natural History.*

If a virginal were made with a double concave, the one all the length of the virginal, and the other at the end of the strings, as the harp hath, it must make the sound perfecter, and not so *shallow* and jarring. *Bacon.*

The load lieth open on the grass, or but *shallowly* covered. *Curew.*

By it do all things live their measured hour :
We cannot ask the thing which is not there,
Blaming the *shallowness* of our request. *Herbert.*

I cannot wonder enough at the *shallowness* and im-
pertinent zeal of the vulgar sort in Drunin, who
were carried away with such an ignorant devotion for
his successes, when it little concerned their religion
or security. *Howel.*

You that so oft have sounded
And fathomed all his thoughts, that know the deeps
And *shallows* of his heart, should need no instru-
ments

To advance your ends. *Denham.*

Having but newly left those grammatic flats and
shallows, where they stuck unreasonably, to learn a
few words with lamentable construction, and now on
the sudden transported, to be tossed with their un-
ballasted wits in fathomless and unquiet deeps of
controversy, they do grow into hatred of learning.

Milton.

Uncertain and unsettled he remains,
Deep versed in books, and *shallow* in himself. *Id.*

I am made a *shallow* forded stream,
Seen to the bottom : all my clearness scornd,
And all my faults exposed. *Dryden's All for Love.*

Shallow brooks, that flowed so clear,
The bottom did the top appear. *Dryden.*

He sounds and fathoms him to find
The *shallows* of his soul. *Id. Spanish Fryar.*

Three more fierce Eurus in his angry mood
Dashed on the *shallows* of the moving sand,
And in mid ocean left them moored a-land.

Id. Æneid.

Their spawn being lighter than the water, there it
would not sink to the bottom : but be buoyed up by
it, and carried away to the *shallows*.

Ray on the Creation.

With the use of diligence and prudent conduct,
he may decline both rocks and *shallows*. *Norris.*

In arms of the sea, and among islands, there is no
great depth, and some places are plain *shallows*.

Burnet.

It cannot but be matter of just indignation to all
good men, to see a company of lewd *shallow-brained*
huffs making atheism, and contempt of religion, the
sole badge of wit. *South.*

One would no more wonder to see the most *shallow*
nation of Europe the most vain, than to find the
most empty fellows of every nation more conceited
than the rest. *Addison.*

The sea could not be much narrower than it is,
without a great loss to the world ; and must we now
have an ocean of mere flats and *shallows*, to the utter
ruin of navigation ? *Bentley.*

The like opinion he held of Meotis Palus, that by the
floods of Tanais, and the earth brought down thereby,
it grew observably *shallower* in his days, and would
in process of time become a firm land.

Browne's Vulgar Errors.

SHALM, *n. s.* Germ. *shelm* ; Teut. *schemme*.
A kind of musical pipe.

Every captain was commanded to have his soldiers
in readiness to set forward upon the sign given, which
was by the sound of a *shalm* or hoboy.

Knolles's History of the Turks.

SHAM, *v. n., n. s., & adj.* Welsh *shommi*, to
cheat. To trick ; cheat ; fool with a fraud : a low
word : the derivatives corresponding.

Men tender in point of honour, and yet with little
regard to truth, are sooner wrought upon by shame
than by conscience, when they find themselves
fooled and *shammed* into a conviction. *L'Estrange.*

We must have a care that we do not, for want of
laying things and things together, *sham* fallacies
upon the world for current reason. *Id.*

It goes a great way when natural curiosity and
vulgar prejudice shall be assisted with the *shams* of
astrological judgments. *Id.*

He that first brought the *sham*, wheedle, or banter
in use, put together, as he thought fit, those ideas he
made it stand for. *Locke.*

That in the sacred temple needs would try
Without a fire the' unheated gums to fry,
Believe who will the solemn *sham*, not I. *Addison.*

Then all your wits that flee and *sham*,
Down from Don Quixote to Tom Tram,
From whom I jests and puns purloin,
And slyly put them off for mine,
Fond to be thought a country wit. *Prior.*

Never join the fray,

Where the *sham* quarrel interrupts the way. *Cray.*

SHAMAMS are wizards or conjurers, in high
repute among several idolatrous nations inhabit-
ing different parts of Russia. By their enchant-
ments they pretend to cure diseases, to divert
misfortunes, and to foretel futurity. They are
great observers of dreams, by the interpretation
of which they judge of their good or bad fortune.
They pretend likewise to chiromancy, and to
foretel a man's good or ill success by the lines of
his hand. By these and such like tricks they
have a very great ascendancy over the under-
standings, and a great influence on the conduct,
of those people

SHAM'BLES, *n. s.* Of uncertain etymology ;
Ital. *scannaglia*.—Johnson : or Lat. *scanni macelli*.
The place where butchers kill or sell their meat ;
a butchery.

Far be the thoughts of this from Henry's heart,
To make a *shambles* of the parliament-house.

Shakspeare. Henry VI.

I hope my noble lord esteems me honest,
—Oh, ay, as summer flies are in the *shambles*,
That quicken even with blowing. *Id. Othello.*

He warned a flock of sheep, that were driving to
the *shambles*, of their danger ; and, upon uttering
some sounds, they all fled. *Arbutnot.*

When the person is made the jest of the mob,
or his back the *shambles* of the executioner, there is
no more conviction in the one than in the other.

Watts.

SHAMBLES, among miners, a sort of niches or
landing places, left at such distances in the adits
of the mines that the shovel-men may con-
veniently throw up the ore from shamble to
shamble till it comes to the top of the mine.

SHAM'BLING, *adj.* See SCAMBLING. Mov-
ing awkwardly and irregularly. A low bad
word.

By that *shambling* in his walk, it should be my
rich banker, Gomez, whom I knew at Barcelona.

Dryden's Spanish Fryar.

So when nurse Nokes to act young Ammon tries,
With *shambling* legs, long chin, and foolish eyes,
With dangling hands he strokes the' imperial robe,
And with a cuckold's air commands the globe.

Smith.

SHAME, *n. s., v. a. & v. n.* } Saxon *reem* ;
SHAME'FACED, *adj.* } Teut. *scham* ; Belg.
SHAME'FACEDLY, *adv.* } *scheam*. Pudicity ;
SHAME'FACEDNESS, *n. s.* } the passion felt at
SHAME'FUL, *adj.* } a supposed loss of
SHAME'FULLY, *adv.* } reputation ; the
SHAME'LESS, *adj.* } cause or reason of
SHAME'LESSLY, *adv.* } shame ; disgrace ;
SHAME'LESSNESS, *n. s.* } ignominy ; re-

proach: to shame is, to make ashamed; disgrace; to be ashamed: shamefaced, modest; bashful; easily discountenanced: the adverb and noun substantive corresponding: shameful is, disgraceful; infamous; ignominious; raising shame: the adverb corresponding: shameless is, devoid of shame; impudent; audacious: the adverb and noun substantive corresponding.

The king to day, as one of the vain fellows, *shamelessly* uncovereth himself. 2 Samuel vi. 20.

A foul *shame* is upon the thief. Eccclus. v. 14.

Would she *shamefully* fail in the last act in this contrivance of the nature of man? *More.*

Philoclea, who blushing, and withal smiling, making *shamefacedness* pleasing, and pleasure *shamefaced*, tenderly moved her feet, unwonted to feel the naked ground. *Sidney.*

Lamenting sorrow did in darkness lie,
And *shame* his ugly face did hide from living eye. *Spenser*

Great *shame* it is, thing so divine in view,
Made for to be the world's most ornament,
To make the bait her gazers to embrew;
Good *shames* to be to ill an instrument. *Id.*

She is the fountain of your modesty;
You *shamefaced* are, but *shamefacedness* itself is she. *Currie Queene.*

None but that saw, quoth he, would ween for truth,

How *shamefully* that maid he did torment. *Id.*

This all through that great prince's pride did fall,
And came to *shameful* end. *Id.*

Peace, peace, for *shame*, if not for charity.
—Urge neither charity nor *shame* to me:
Uncharitably with me have you dealt,
And *shamefully* my hopes by you are butchered:
My charity is outrage, life my *shame*;
And in my *shame* still lives my sorrows' rage.

Shakespeare. Richard III.

To tell thee of whom derived,

Were *shame* enough to *shame* thee, wert thou not *shameless*. *Shakespeare.*

If thou hast power to raise him, bring him hither,
And I've power to *shame* him hence:
Oh, while you live, tell truth and *shame* the devil. *Id.*

Sham'st thou not, knowing whence thou art ex-
traught,

To let thy tongue detect thy base-born heart? *Id.*

Conscience is a blushing *shamefaced* spirit that
mutinies in a man's bosom: it fills one full of obsta-
cles. *Id. Richard III.*

Hyperbolus by suffering did traduce
The ostracism, and *shamed* it out of use. *Cleaveland.*

To the trunk of it authors give such a magnitude,
as I *shame* to repeat. *Raleigh's History of the World.*

The *shameless* denial hereof by some of their friends,
and the more *shameless* justification by some of their
flatterers, makes it needful to exemplify, which I had
rather forbear. *Raleigh.*

Cruel Auster thither hied him;

And, with the rush of one rude blast,

Shamed not spitefully to waste

All his leaves, so fresh, so sweet,

And lay them trembling at his feet. *Crashaw.*

Being most impudent in her heart, she could, when
she would, teach her cheeks blushing, and make
shamefacedness the cloak of *shamelessness*. *Sidney.*

He that blushes not at his crime, but adds *shame-
lessness* to his *shame*, hath nothing left to restore him
to virtue. *Taylor.*

Despoiled

Of all our good, *shamed*, naked, miserable. *Milton.*

Applause

Turned to exploding hiss, triumph to *shame*,
Cast on themselves from their own mouths. *Id.*

But I his holy secret

Presumptuously have published, impiously,
Weakly at least, and *shamefully*. *Id. Agonistes.*

For this he shall live hated, be blasphemed,
Seized on by force, judged, and to death condemned,
A *shameful* and accurst! *Milton.*

He must needs be *shamelessly* wicked that abhors
not this licentiousness. *Hale.*

Hide, for *shame*,

Romans, your grandsires images,

That blush at their degenerate progeny. *Dryden.*

The coward bore the man immortal spite,

Who *shamed* him out of madness into flight. *Id.*

Your *shamefaced* virtue shunned the people's
praise,

And senate's honours. *Id.*

None but fools, out of *shamefacedness* hide their
ulcers, which, if shown, might be healed.

Id. Dufrenoy.

A man may be *shamefaced*, and a woman modest,
to the degree of scandalous. *L'Estrange.*

In the schools men are allowed, without *shame*, to
deny the agreement of ideas; or, out of the schools,
from thence have learned, without *shame*, to deny
the connection of ideas. *Locke.*

Were there but one righteous man in the world,
he would hold up his head with confidence and
honour; he would *shame* the world, and not the
world him. *South.*

God deliver the world from such guides, who are
the *shame* of religion. *Id.*

Those who are ready enough to confess him, both
in judgment and profession, are, for the most part,
very prone to deny him *shamefully* in their doings.

Id. Sermons.

God deliver the world from such hucksters of
souls, the very *shame* of religion, and the *shameless*
subverters of morality. *Id.*

From this time we may date that remarkable turn
in the behaviour of our fashionable Englishmen, that
makes them *shamefaced* in the exercise of those du-
ties which they were sent into the world to perform.

Addison's Freeholder.

His naval preparations were not more surprising
than his quick and *shameful* retreat; for he returned
to Carthage with only one ship, having fled without
striking one stroke. *Arbutnot.*

O *shame* to manhood! shall one daring boy

The scheme of all our happiness destroy?

Pope's Odyssey.

Who *shames* a scribbler, breaks a cobweb through:

He spins the slight self-pleasing thread anew. *Pope.*

Such *shameless* bards we have; and yet, 'tis true,

There are as mad, abandoned criticks too. *Id.*

The knave of diamonds tries his wily arts,

And wins, O *shameful* chance! the queen of hearts. *Id.*

But that effeminacy, folly, lust,

Enervate and enfeeble, and needs must;

And that a nation *shamefully* debased

Will be despised and trampled on at last,

Unless sweet Penitence her powers renew,

Is truth if history itself be true. *Cowper.*

SHAMGAR, the son of Anath, the third judge
of Israel after Joshua. He delivered his country
from the yoke of the Philistines, and slew 600 of
them with an ox-goad, about A.M. 2657. See
ISRAEL.

SHAMMAH, the name of three heroes of
Israel, under David. See 2 Sam. xxiii. 11—17.
25. 33.

SHAM'VOIS, *n. s.* Fr. *chamois*. See CHAMOIS. A kind of wild goat.

I'll bring thee
To clustering filberds, and sometimes I'll get thee
Young *shamois* from the rocks. *Shakspeare*

SHAMOIS, in zoology. See CAPRA.

SHAMOIS, CHAMOIS, or SHAMMY, in commerce, a kind of leather, either dressed in oil or tanned, much esteemed for its softness, pliancy, &c. It is prepared from the skin of the chamois or shamois, a kind of rupicapra, or wild goat, called also isard, inhabiting the mountains of the ci-devant French and Italian provinces of Dauphiny, Savoy, Piedmont, and the Pyrenees. Besides the softness and warmth of the leather, it has the faculty of bearing soap without damage; which renders it very useful on many accounts. In France, &c., some wear the skin raw, without any preparation. Shammy leather is used for the purifying of mercury, which is done by passing it through the pores of this skin, which are very close. The true chamois leather is counterfeited with common goat, kid, and even with sheep skins, the practice of which makes a particular profession, called by the French chamoisure. The last, though the least esteemed, is yet so popular, and such vast quantities of it are prepared, especially about Orleans, Marseilles, and Thoulouse, that it may not be amiss to give the method of preparation.

The skins, being washed, drained, and smeared over with quick-lime on the fleshy side, are folded in two lengthwise, the wool outwards, and laid on heaps, and so left to ferment eight days, or, if they have been left to dry after flaying, then fifteen days. Then they are washed out, drained, and half dried; laid on a wooden leg, or horse, the wool stripped off with a round staff for that purpose, and laid in a weak pit, the lime whereof had been used before, and has lost the greatest part of its force. After twenty-four hours they are taken out, and left to drain twenty-four more; they are then put in another stronger pit. This done, they are taken out, drained, and put in again, by turns; which begins to dispose them to take oil; and this practice they continue for six weeks in summer or three months in winter: at the end whereof they are washed out, laid on the wooden leg, and the surface of the skin on the wool side peeled off, to render them the softer; then made into parcels, steeped a night in the river, in winter more, stretched six or seven over one another on the wooden leg, and the knife passed strongly on the flesh side, to take off any thing superfluous, and render the skin smooth. Then they are steeped as before, in the river, and the same operation is repeated on the wool side; they are then thrown into a tub of water, with bran in it, which is brewed among the skins till the greatest part sticks to them, and then separated into distinct tubs, till they swell, and rise of themselves above the water. By this means the remains of the lime are cleared out; they are then wrung out, hung up to dry on ropes, and sent to the mill, with the quantity of oil necessary to scour them: the best oil is that of stock-fish. Here they are first thrown in bundles into the river for twelve hours, then laid in the mill-trough, and filled without

oil till they be well softened; then oiled with the hand, one by one, and thus formed into parcels of four skins each; which are milled and dried on cords a second time; then a third; and then oiled again and dried. This process is repeated as often as necessary; when done, if there be any moisture remaining, they are dried in a stove, and made up into parcels wrapped up in wool; after some time they are opened to the air, but wrapped up again as before, till such time as the oil seems to have lost all its force, which it ordinarily does in twenty-four hours. The skins are then returned from the mill to the chamoiser to be scoured: which is done by putting them in a lixivium of wood-ashes, working and beating them in it with poles, and leaving them to steep till the ley hath had its effect: then they are wrung out, steeped in another lixivium, wrung again; and this is repeated till all the grease and oil be purged out. When this is done, they are half dried, and passed over a sharp-edged iron instrument, placed perpendicular in a block, which opens, softens, and makes them gentle. Lastly, they are thoroughly dried, and passed over the same instrument again; which finishes the preparation, and leaves them in form of shammy. Kid and goat skins are shamoised in the same manner as those of sheep, excepting that the hair is taken off without the use of any lime; and that, when brought from the mill, they undergo a particular preparation called ramalling, more delicate and difficult than the others. It consists in this, that, as soon as brought from the mill, they are steeped in a fit lixivium, taken out, stretched on a round wooden leg, and the hair is scraped off with the knife; this makes them smooth, and, in working, to cast a kind of fine knap. The difficulty is in scraping them evenly.

SHAM'ROCK, *n. s.* Irish *scam rag*. The Irish name for three-leaved grass.

If they found a plot of watercresses or *shamrocks*, there they flocked as to a feast for the time.

Spenser on Ireland.

SHANGALLA, a race of negroes, on the northern frontier of Abyssinia, particularly on the lower part of the Mareb and Tacazze. The tract which they occupy consists of a belt varying in breadth, though averaging about forty miles. It is entirely covered with almost impenetrable forests, fit only for the production of wild animals. The Shangalla are complete savages, who go naked, neither sow nor plant, and have no fixed habitations. During the dry part of the year they live under the shade of trees, the lowest branches of which they cut near the stem, on the upper part, planting the ends of the branches in the earth. Having then covered them with the skins of beasts, and cut away the interior branches, they form a spacious pavilion, which, at a distance appears like a tent, the trunk serving for the pole, the top overshadowing it. During this season every tree is a house, peopled by a family. In the rainy season the soil dissolves completely into mire, and it is no longer possible to live above ground. The Shangalla then seek their winter quarters in caves of the mountains, which are of a soft gritty sandstone, easily excavated. Here they live upon the

flesh which they have dried and prepared during the dry season. The elephant and rhinoceros are taken and killed by various devices. Those who reside where water abounds kill the hippopotami or river horses, which are exceedingly numerous: in sandy tracts, ostriches, and a beautiful species of lizard, form the principal food. Some feed chiefly upon locusts. These various tribes are correctly described by Ptolemy, according to their food, under the titles of Rhizophagi, Elephantophagi, Acridophagi, &c. The meat caught in the fair season is cut into thongs as thick as a man's thumb, like so many ropes, and hung up on the surrounding trees, where the sun dries and hardens it almost to the consistence of leather. In winter they beat it with a wooden mallet, then boil, and then roast it upon the embers.

SHANK, *n. s.* Sax. *ſcœanca*; Belg. *ſchenckel*; Swed. *ſkank*. The middle joint of the leg; that part which reaches from the ankle to the knee: the long or hollow part of an instrument.

Eftsoons her white straight legs were altered
To crooked crawling *ſhanks*, of marrow emptied:
And her fair face to foul and loathſome hue,
And her fine corps to a bag of venom grew.

Spenser.

The sixth age ſhifts
Into the lean and ſlippered pantaloen,
With ſpectacles on noſe, and pouch on ſide;
His youthful hoſe, well ſaved, a world too wide
For his ſhrunk *ſhanks*.

Shakspeare. *As You Like It*.

Shut me nightly in a charnel-house,
O'er covered quite with dead men's rattling bones,
With reeky *ſhanks*, and yellow chapleſs ſkulls.

Shakspeare.

A ſtag ſays, if theſe pitiful *ſhanks* of mine were
but answerable to this branching head, I can't but
think how I ſhould defy all my enemies.

I' Eſtrange.

The *ſhank* of a key, or ſome ſuch long hole, the
punch cannot ſtrike, becauſe the *ſhank* is not forged
with ſubſtance ſufficient.

Moxon.

SHANK, or SHANK-PAINTER, in a ſhip, is a
ſhort chain faſtened under the foremaſt-ſhrouds,
by a bolt, to the ſhip's ſides, having at the other
end a rope faſtened to it. On this ſhank-painter
the whole weight of the aft part of the anchor
reſts when it lies by the ſhip's ſide. The rope,
by which it is hauled up, is made faſt about a
timber-head.

SHANK, in the manege, that part of a horſe's
fore leg which lies between the knee and the
fetlock.

SHANKER, or CHANCER, in medicine, a malign-
ant ulcer, uſually occaſioned by ſome venereal
diſorder. See MEDICINE.

SHANK-PAINTER. See SHANK.

SHANNON, the largeſt river in Ireland, and
one of the fineſt in the Britiſh dominions, not
only on account of its lengthened courſe of 200
miles, but alſo of its great depth in moſt places,
and the gentleneſs of its current, by which it
might be made exceedingly ſerviceable to the
improvement of the country, the communication
of its inhabitants, and conſequently the pro-
moting of inland trade. But the peculiar pre-
rogative of the Shannon is its ſituation, running
from north to ſouth and ſeparating the province
of Connaught from Leiſter and Munſter, and

of conſequence dividing the greateſt part of Ire-
land into what lies on the eaſt, and that on the
weſt of the river; watering in its paſſage the
valuable county of Leiſtrim, the plentiful ſhire of
Roſcommon, the fruitful county of Galway, and
the pleaſant county of Clare; the ſmall but fine
ſhire of Longford, the King's county, and fertile
county of Meath, in Leiſter, the populous
county of Tipperary, the ſpacious ſhire of Time-
rick, and the rough but pleaſant county of Kerry,
in Munſter; viſiting ten counties in its paſſage,
and having on its banks the following remarkable
places, viz. Leiſtrim, Jamestown, Lanesborough,
Athlone, Clonfert, Killaloe, and Limerick; at
twenty leagues below the latter it ſpreads gradually
ſeveral miles in extent, ſo that ſome have con-
ſidered its expanſion as a lake. It at laſt joins
its waters to the ſea, being navigable all that way
for the largeſt veſſels.

SHANSCRIT, the language of the Brahmins
of Hindoſtan. See PHILOLOGY.

SHAPE, *v. a. & n. s.* } *Preter.* ſhaped; *part.*

SHAPE'LESS, *adj.* } *pass.* ſhaped and ſhapen.

Sax. *ſceppan*; Belg. *ſcheppen*; Goth. and Swed.
ſkapa. To form; mould with reſpect to external
dimensions; regulate; image: the noun ſub-
ſtantive and adjective correſponding.

I was ſhapen in iniquity, and in ſin did my mother
conceive me. *Psalm li. 5.*

The ſhapes of the locuſts were like unto horſes
prepared for battle. *Rev. ix. 7.*

I, that am not ſhaped for ſportive tricks,
Nor made to court an amorous looking-glaſs,
I, that am rudely ſtampt, and want love's majeſty,
To ſtrut before a wanton ambling nymph.

Shakspeare. *Richard III.*

Lovers and madmen have their ſeething brains,
Such ſhaping fantasies that apprehend
More than cool reaſon ever comprehends.

Shakspeare.

He beat me grievouſly in the ſhape of a woman;
for in the ſhape of a man, maſter Brook, I fear not
Goliath with a weaver's beam. *Id.*

He is deformed, crooked, old, and ſere;
Ill faced, worſe bodied, ſhapeleſs every where. *Id.*

Mr. Candish, when without hope, and ready to
ſhape hiſc courſe by the eaſt homewards, met a ſhip
which came from the Philippines. *Raleigh.*

Thrice had I loved thee,
Before I knew thy face or name,
So in a voice, ſo in a ſhapeleſs flame,
Angels affect us oft, and worſhipped be. *Donne.*

Thoſe nature hath ſhaped with a great head, nar-
row breaſt, and ſhoulders ſticking out, ſeem much
inclined to a conſumption. *Harvey.*

To the ſtream, when neither friends, nor force,
Nor ſpeed, nor art avail, he ſhapes hiſc courſe.

Denham.

The other ſhape,

If ſhape it may be called, that ſhape had none
Distinguishable in member, joint, or limb. *Milton.*

When fancy hath formed and ſhaped the perfecteſt
idea of bleſſedneſs, our own more happy experiences
of greater muſt diſabuſe us. *Boyle.*

In vegetables and animals the ſhape we moſt fix on,
and are moſt led by. *Locke.*

No ſhapeſmith yet ſet up and drove a trade,
To mend the work that providence had made.

Garth.

First a charming ſhape enſlaved me,
An eye then gave the fatal ſtroke;

Till by her wit Corinna saved me,
And all my former fetters broke. *Addison.*
Mature the virgin was, of Egypt's race;
Grace shaped her limbs, and beauty decked her face. *Prior.*

Charmed by their eyes, their manners I acquire,
And shape my foolishness to their desire. *Id.*
Now the victor stretched his eager hand,
Where the tall nothing stood, or seemed to stand;
A shapeless shade, it melted from his sight,
Like forms in clouds, or visions of the night! *Pope.*

Fathers and mothers, friends and relations, seem
to have no other wish towards the little girl, but
that she may have a fair skin, a fine shape, dress
well, and dance to admiration. *Law.*

SHAPINSHAY, one of the Orkney Islands, lying about three miles north of Pomona, or Mainland. It is about seven miles long from east to west, and five broad from north to south, resembling the form of a cross. Along the whole coast the surface is low, pretty level, and the soil fertile in oats, barley, and grass; although agriculture is not improved. Towards the middle the land is higher; and, having never been cultivated, is fit only for pasture. Relics of ancient superstition appear in the Standing stone of Shapinsay, and the Black Stone of Odin. A small bay is named Grucula, which, tradition says, is from one of the celebrated Agricola's ships having been stranded in it, during a storm, when he sailed round the island. In farther proof of this, Roman coins have been lately found near it. There are several subterraneous habitations called Picts' Houses. The only harbour in the island is Elwick, and it is an excellent one. It has from four to six fathoms water, over a bottom of hard clay covered with sand. On the west it has a fine beach. About eighty boats are employed in fishing. Kelp is also manufactured. Long. 0° 28' E. of Edinburgh, lat. 58° 55' N.

SHAPOUR, a ruined and once celebrated city, at the end of the valley of Kazeroon, in the province of Fars, Persia. It is said to have existed prior to the time of Alexander the Great, and to have been destroyed by him. It was rebuilt with augmented splendor by Sapor, who made it his capital. Though deserted, the breadth and circumference of the ramparts, and the remains of some public buildings, show its former extent and magnificence. It is situated under a range of mountains, on the banks of a small rapid river, and in a wild romantic spot. The hills in the immediate vicinity appear to have been formerly fortified; and an extraordinary cavern, farther up the river, has given rise to many fabulous stories. Eighteen miles west of Kazeroon.

SHARD, *n. s.* Sax. *ſceard*; Frisick *ſchaerde*.
A fragment of an earthen vessel. Used by Spenser for a frith or strait.

Upon that shore he spied Atin stand,
There by his master left, when late he fared
In Phedria's fleet bark, o'er that perilous shard. *Faerie Queene.*

Often shall we find
The sharded beetle in the safer hold,
Than is the full winged eagle. *Shakspeare. Cymbeline.*

For charitable prayers,
Shards, flints, and pebbles, should be thrown on her;
Yet here she is allowed her virgin chants,
Her maiden strewments. *Id. Hamlet*

Ere to black Hecat's summons
The sharded beetle, with his drowsy hums,
Hath rung night's yawning peal, there shall be done
A deed of dreadful note. *Shakspeare.*

Shards or mallows for the pot
Keep the loosened body sound. *Dryden. Horace.*

SHARE, *v. a., v. n. & n. s.* } Saxon *ſceapan*;
SHARE'BONE, *n. s.* } *ſcypan*. To divide;
SHA'BER. } part among many;
partake with others; cut; separate; have part:
the noun substantives corresponding.

The captain, half of whose soldiers are dead, and
the other quarter never mustered or seen, comes
shortly to demand payment of his whole account;
where, by good means of some great ones, and privy
sharings with the officers of other some, he receiveth
his debt. *Spenser on Ireland.*

Good fellows all
The latest of my wealth I'll share among you. *Shakspeare.*
Any man may take trial of his fortune, provided
he acknowledge the lord's right, by sharing out unto
him a toll. *Carew.*

Most it seemed the French king to import,
As sharer in his daughter's injury. *Daniel's Civil War.*

In vain does valour bleed,
While avarice and rapine share the land. *Milton.*
With swift wheel reverse deep entering shared
All his right side. *Id.*

If every just man, that now pines with want,
Had but a moderate and beseeching share
Of that which lewdly-pampered luxury
Now heaps upon some with vast excess. *Id.*

The subdued territory was divided into greater and
smaller shares, besides that reserved to the prince. *Temple.*

Well may he then to you his cares impart,
And share his burden where he shares his heart. *Dryden.*

Waved by the wanton winds his banner flies,
All maiden white, and shares the people's eyes. *Id.*
Scalp, face, and shoulders, the keen steel divides.
And the shared visage hangs on equal sides. *Id.*

I'll give you arms; burn, ravish, and destroy:
For my own share one beauty I design;
Engage your honours that she shall be mine. *Id.*
Great cities shall with walls be compassed round,
And sharpened shares shall vex the fruitful ground. *Id.*

People not allowed to be sharers with their com-
panions in good fortune, will hardly agree to be
sharers in bad. *L'Estrange.*

You must have known it.
—Indeed I did, then favoured by the king,
And by that means a sharer in the secret. *Rowe.*
Though the weight of a falsehood would be too
heavy for one to bear, it grows light in their imagi-
nations when it is shared among many. *Addison's Spectator.*

The youths have equal share
In Marcia's wishes, and divide their sister. *Id. Cato.*

An overgrown estate falling into the hands of one
that has many children, it is broken into so many
portions as render the sharers rich enough. *Addison.*
In the primitive times the advantage of priesthood
was equally shared among all the order, and none
of that character had any superiority. *Collier.*

If, by taking on himself human nature at large, he hath a compassionate and tender sense of the infirmities of mankind in general, he must needs, in a peculiar manner, feel and commiserate the infirmities of the poor, in which he himself was so eminent a sharer. *Atterbury.*

The cartilage bracing together the two ossa pubis, or *sharebones*, Bartholine saith, is twice thicker and laxer in women than men. *Derham.*

In poets as true genius is but rare,
True taste as seldom is the critic's *share*. *Pope.*

I suffer many things as an author militant, whereof in your days of probation you have been a sharer. *Id. to Swift.*

This is Dutch partnership, to *share* in all our beneficial bargains, and exclude us wholly from theirs. *Swift.*

He who doth not perform that part assigned him is a very mischievous member of the publick : because he takes his *share* of the profit, and yet leaves his *share* of the burden to be born by others. *Id.*

Suppose I *share* my fortune equally between my children and a stranger, will that unite them ? *Id.*

Incumbent o'er the shining *share*
The master leans, removes the' obstructive clay. *Thomson.*

By being desirous that every one should have their full *share* of the favours of God, they would not only be content, but glad, to see one another happy in the little enjoyments of this transitory life. *Law.*

For clay the couler is long and bending, and the *share* narrow. *Mortimer.*

These, although they bear a *share* in the discharge, yet have different offices in the composition. *Browne's Vulgar Errors.*

SHARE OF A PLOUGH, that part which cuts the ground ; the extremity forwards being covered with a sharp pointed iron, called the point of the share, and the end of the wood behind the tail of the share. See **PLOUGH** and **RURAL ECONOMY**.

SHARK, *n. s., v. a. & v. n.* Lat. *charcharias*, of Gr. *χαρσσω*. A voracious sea fish ; a greedy fellow ; trick ; fraud : to pick up ; devour ; to play the petty thief.

Young Fontinbras,
Of unimproved mettle, hot and full,
Hath in the skirts of Norway, here and there,
Sharked up a list of landless resolute.

The fly leads a lazy, voluptuous, scandalous, *sharking* life, hateful wherever she comes. *L'Estrange.*

There are cheats by natural inclination as well as by corruption ; nature taught this boy to *shark*, not discipline. *Id.*

David's messengers are sent back to him, like so many *sharks* and runnagates, only for endeavouring to compliment an ill nature out of itself, and seeking 'hat by petition which they might have commanded by their sword. *South.*

Wretches who live upon the *shark*, and other men's sins, the common poisoners of youth, equally desperate in their fortunes and their manners, and getting their very bread by the damnation of souls. *Id.*

The old generous English spirit, which heretofore made this nation so great in the eyes of all the world, seems utterly extinct ; and we are degenerated into a mean, *sharking*, fallacious, undermining converse ; there being a snare and a trapan almost in every word we hear, and every action we see. *Id.*

His jaws horrick armed with threefold fate,
The direful *shark*. *Thomson's Summer.*

And such things as the entrails and the brains
Regaled two *sharks*, who followed o'er the billow—
The sailors ate the rest of poor Pedrillo. *Byron.*

SHARK, in ichthyology. See **SQUALUS**.

SHARON, in ancient geography, the name of three cantons of Palestine. The first lay between Mount Tabor and the sea of Tiberias ; the second between the city of Cæsarea of Palestine, and Joppa ; and the third lay beyond Jordan. To give an idea of perfect beauty, Isaiah said, the glory of Lebanon and the beauty of Carmel must be joined to the abundance of Sharon. Isaiah xxxiii. 9 ; xxxi. 2. The plains of Sharon are of vast extent ; and, when surveyed by the abbe Mariti a few years ago, they were sown with cucumbers ; and he says that such a number is annually produced as not only to supply the whole neighbourhood, but all the coasts of Cyprus and the city of Damietta. 4. In the middle of the plain, between Arsus and Lydda, rises a small mountain, upon the ridge of which there is a village called Sharon, from the ancient city whose king was conquered by Joshua.

SHARP, *adj., n. s., v. a.,* Saxon *ſcearp* ;
SHARP'EN, *v. a.* [& *v. n.* Teut. *scharff* ; Dan.
SHARP'ER, *n. s.* *skarp*. Acute ; keen ;
SHARP'LY, *adv.* (cutting ; piercing ;
SHARP'NESS, *n. s.* terminating in a
SHARP'SET, *adj.* point or edge :
SHARP'-SIGHTED, hence witty ; inge-
SHARP'-VISAGED, nious ; acute of
mind ; attentive ; vigilant ; quick ; sour, but not
austere ; shrill of sound ; painful ; afflictive ;
emaciated ; lean : a sharp or acute sound ; a
pointed weapon : to make keen : play thievish
tricks : to sharpen is also to make sharp or
keen ; give edge or point to ; make quick, inge-
nious, &c. ; make sour : a sharper is a low,
tricky fellow : the adverb and noun substantive
following correspond with sharp, as an adjective :
sharp-set is hungry ; ravenous ; eager : sharp-
sighted and visaged explain themselves.

The Israelites went down to the Philistines, to
sharpen every man his share and his couler.

1 Sam. xiii. 20.

Mine enemy *sharpeneth* his eyes upon me.

Job xvi. 9.

Thy tongue deviseth mischiefs, like a *sharp* razor,
working deceitfully. *Ps.* lii. 2.

Overmuch quickness of wit, either given by na-
ture, or *sharpened* by study, doth not commonly bring
greatest learning, best manners, or happiest life in
the end. *Ascham.*

Now as fine in his apparel as if he would make
me in love with a cloak, and verse for verse with the
sharpest witted lover in Arcadia. *Sidnev.*

Basilius forced her to stay, though with much ado,
she being *sharp-set* upon the fulfilling of a shrewd
office, in overlooking Philoclea. *Id.*

Palladius neither suffering us nor himself to take
in hand the party till the afternoon ; when we were
to fight in troops, nor differing otherwise from earnest,
but that the *sharpness* of the weapons was taken
away. *Id.*

So we, if children young diseased we find,
Anoint with sweets the vessel's foremost parts,
To make them taste the potions *sharp* we give ;
They drink deceived, and so deceived they live. *Spenser.*

They are more *sharply* to be chastised and reformed

than the rude Irish, which, being very wild at the first, are now become more civil. *Id.*

Sharp and subtle discourses procure very great applause ; but, being laid in the balance with that which sound experience plainly delivereth, they are overweighed. *Hooker.*

The weaker their helps are, the more their need is to *sharpen* the edge of their own industry. *Id.*

If the understanding or faculty of the soul be like unto bodily sight, not of equal *sharpness* in all ; what can be more convenient than that, even as the dark-sighted man is directed by the clear about things visible, so likewise, in matters of deeper discourse, the wise in heart doth shew the simple where his way lieth. *Id.*

He caused his father's friends to be cruelly tortured ; grieving to see them live to whom he was so much beholden, and therefore rewarded them with such *sharp* payment. *Knolles.*

She hath tied
Sharp toothed unkindness like a vulture here. *Shakspeare.*

If he should intend his voyage towards my wife, I would turn her loose to him ; and what he gets more of her than *sharp* words, let it lie on my head. *Id.*

There, gentle *Hermia*, may I marry thee :
And to that place the *sharp* Athenian law
Cannot pursue us. *Id.*

My falcon now is *sharp* and passing empty,
And, till she stoop, she must not be full gorged ;
For then she never looks upon her lure. *Id.*

That she may feel
How *sharper* than a serpent's tooth it is,
To have a thankless child. *Id. King Lear.*

It is the lark that sings so out of tune,
Straining hard discords and displeasing *sharps*.
Shakspeare.

Epicurean cooks
Sharpen with cloyless sauce his appetite. *Id.*
There's gold for thee ;

Thou must not take my former *sharpness* ill,
I will employ thee back again. *Id.*

There was seen some miles in the sea a great pillar
of light, not *sharp*, but in form of a column or cylinder, rising a great way up towards heaven. *Bacon.*

In whistling you contract the mouth, and, to make it more *sharp*, men use their finger. *Id. Natural History.*

Let one whistle at the one end of a trunk, and hold your ear at the other, and the sound strikes so *sharp* as you can scarce endure it. *Bacon.*

The grating of a saw, when *sharpened*, offends so much, as it setteth the teeth on edge. *Id.*

You contract your eye when you would see *sharply* ;
and erect your ear when you would hear attentively. *Id.*

If we had nought but sense, each living wight
Which we call brutes, would be more *sharp* than we. *Davies.*

As the *sharpest* eye discerneth nought,
Except the sun-beams in the air do shine ;
So the best soul with her reflecting thought,
Sees not herself without some light divine. *Id.*

If she were the body's quality,
Then would she be with it sick, maimed, and blind ;
But we perceive where these privations be,
An healthy, perfect, and *sharp-sighted* mind. *Id.*

At the arrival of the English ambassadors, the soldiers were *sharply* assailed with wants. *Hayward.*

The mind and memory are more *sharply* exercised
in comprehending another man's things than our own. *Ben Jonson.*

Whom the whetstone *sharps* to eat,
They cry, millstones are good meat. *Id.*

Force consisteth in the roundings and risings of the work, according as the limbs do more or less require it ; so as the beholder shall spy no *sharpness* in the bordering lines. *Wotton.*

The instances you mention are the strongest and *sharpest* that can be urged. *Digby.*

Your majesty's clear and *sharp-sighted* judgment has as good a title to give law in matters of this nature as in any other. *Denham.*

I am not so *sharp-sighted* as those who have discerned this rebellion contriving from the death of queen Elizabeth. *Clarendon.*

Their embryon atoms
Light armed or heavy, *sharp*, smooth, light, or slow. *Milton.*

The *sharp* desire I had
Of tasting. *Id.*

Their pious feign'd
In *sharp* contest of battle found no aid. *Id.*

Death becomes
His final remedy ; and after life
Tried in *sharp* tribulation, and refined
By faith and faithful works. *Id. Paradise Lost.*
His visage drawn he felt to *sharp* and spare. *Milton.*

The squadron bright, *sharp'ning* in moored horns
Their phalanx. *Id.*

The *sharp* sharpened his visual ray
To objects distant far. *Id.*
The Welsh that inhabit the mountains are commonly *sharp-visaged*. *Hale's Origin of Mankind.*

It is a very small comfort that a plain man, lying under a *sharp* fit of the stone, receives from this sentence. *Tillotson.*

Such an assurance as will *sharpen* men's desires,
and quicken their endeavours for obtaining a lesser good, ought to inspire men with more vigour in pursuit of what is greater. *Id.*

It is so much the firmer, by how much broader the bottom, and *sharper* the top. *Temple.*

Provoking sweat extremely, and taking away all *sharpness* from whatever you put in, must be of good effect in the cure of the gout. *Id.*

To come near the point and draw unto a *sharper* angle, they do not only speak and practise truth, but really desire its enlargement. *Broune's Vulgar Errors.*

In shipping such as this the Irish kern,
And untaught Indian, on the stream did glide,
Ere *sharp*-keeled boats to stem the flood did learn,
Or fin-like oars did spread from either side. *Dryden.*

Sharp to the world, but thoughtless of renown,
They plot not on the stage, but on the town. *Id.*

To *sharp-eyed* reason this would seem untrue ;
But reason I through love's false opticks view. *Id.*

Sharp tasted citrons Median climes produce ;
Bitter the rind, but generous is the juice. *Id.*

Cease contention : be thy words severe,
Sharp as he merits ; but the sword forbear. *Id.*

No : 'tis resistance that inflames desire ;
Sharpens the darts of love, and blows the fire. *Dryden.*

Ere ten moons had *sharpened* either horn,
To crown their bliss a lovely boy was born. *Id.*

The *sharpness* of his satire, next to himself, falls most heavily on his friends. *Id.*

Nothing so fierce but love will soften, nothing so *sharp-sighted* in other matters but it throws a mist before the eyes on't. *L'Estrange.*

I live upon what's my own ; whereas your scandalous life is only cheating or *sharpening* one half of the year, and starving the other. *Id.*

Sharps, as pikes, prey upon their own kind. *Id.*
Our senses are *sharp-set* on pleasures. *Id.*

For the various modulation of the voice, the upper end of the windpipe is endued with several cartilages to contract or dilate it, as we would have our voice flat or *sharp*. *Ray.*

The windpipe is continually moistened with a glutinous humour, issuing out of small glandules in its inner coat, to fence it against the *sharp* air. *Id.*

With edged grooving tools they cut down and smoothen away the extuberances left by the *sharp* pointed grooving tools, and bring the work into a perfect shape. *Mozon.*

My haughty soul would swell,
Sharpen each word, and threaten in my eyes.

Smith.

This is a subject of which it is hard to speak without satirical *sharpness*, and particular reflections on many churches of christians. *Sprat.*

How often may we meet with those who are one while courteous, but within a small time after are so supercilious, *sharp*, troublesome, fierce, and exceptionous, that they are not only short of the true character of friendship, but become the very sores and burdens of society! *South.*

It may contribute to his misery, heighten the anguish, and *sharpen* the sting of conscience, and so add fury to the everlasting flames, when he shall reflect upon the abuse of wealth and greatness. *Id.*

Not a single death only that then attended this profession; but the terror and *sharpness* of it was redoubled in the manner and circumstances. *Id.*

There is nothing makes men *sharper*, and sets their hands and wits more at work, than want.

Addison on Italy.

Her nails are *sharpened* into pointed claws;
Her hands bear half their weight, and turn to paws.

Addison.

The son returned with strength of constitution, *sharpness* of understanding, and skill in languages. *Id.*

Is a man bound to look out *sharp* to plague himself, and to take care that he slips no opportunity of being unhappy? *Collier.*

If butchers had but the manners to go to *sharps*, gentlemen would be contented with a rubber at cuffs. *Id.*

He should retrench what he lost to *sharpers*, and spent upon puppet plays, to apply it to that use.

Arbutnot.

Nor here the sun's meridian rays had power,
Nor wind *sharp* piercing, nor the rushing shower,
The verdant arch so close its texture kept.

Pope's Odyssey.

I only wear it in a land of Hectors,
Thieves, supercargoes, *sharpers*, and directors.

Pope.

A comedy of Johnson's, not Ben, held seven nights; for the town is *sharp-set* on new plays. *Id.*

A clergyman, established in a competent living, is not under the necessity of being so *sharp* and exacting. *Swift.*

Many other things belong to the material world wherein the *sharpest* philosophers have never yet arrived at clear and distinct ideas. *Watts.*

Different simple ideas are sometimes expressed by the same word, as sweet and *sharp* are applied to the objects of hearing and tasting. *Id.*

There is a *sharpness* in vinegar, and there is a *sharpness* in pain, in sorrow, and in reproach; there is a *sharp* eye, a *sharp* wit, and a *sharp* sword: but there is not one of these several *sharpnesses* the same as another of them; and a *sharp* east wind is different from them all. *Id. Logic.*

SHARP (Abraham), an eminent mathematician, mechanist, and astronomer, descended from an

ancient family at Little Horton, near Bradford, in the West Riding of Yorkshire, where he was born about 1651. He was put apprentice to a merchant at Manchester; but his genius led him strongly to the study of mathematics, both theoretical and practical. By the consent, therefore, of his master, he quitted business and removed to Liverpool, where he studied mathematics, astronomy, &c.; and where, for a subsistence, he opened a school, and taught writing and accounts, &c. He had not been long at Liverpool when he fell in with a merchant from London, in whose house the astronomer Mr. Flamsteed then lodged. To become acquainted with this eminent man, Mr. Sharp engaged with the merchant as a book-keeper, and soon contracted an intimate friendship with Mr. Flamsteed, by whose interest and recommendation he obtained a more profitable employment in the dock-yard at Chatham; where he continued till his friend and patron, knowing his great merit in astronomy and mechanics, called him to his assistance, in contriving, adapting, and fitting up the astronomical apparatus in the royal Observatory at Greenwich, which had been recently built, about 1676. He was principally employed in the construction of the mural arch; which in fourteen months he finished greatly to the satisfaction of Mr. Flamsteed. According to Mr. Smeaton, this was the first good instrument of the kind; and Mr. Sharp the first artist who cut accurate divisions upon astronomical instruments. When it was constructed, Mr. Flamsteed was thirty and Mr. Sharp twenty-five years of age. These two friends continued together for some time, making observations on the meridional zenith distances of the fixed stars, sun, moon, and planets, with the times of their transits over the meridian; also the diameters of the sun and moon, and their eclipses, and those of Jupiter's satellites, the variation of the compass, &c. Mr. Sharp assisted Flamsteed also in making a catalogue of nearly 3000 fixed stars, with their longitudes and magnitudes, their right ascensions and polar distances, with the variations of the same while they change their longitude by one degree. See ASTRONOMY. But from the fatigue of continually observing the stars at night, in a cold thin air, he was reduced to a bad state of health; for the recovery of which he retired to his house at Horton; where, on his recovery, he fitted up an observatory of his own; having first made an elegant and curious engine for turning all kinds of work in wood or brass, with a mandril for turning irregular figures, as ovals, roses, wreathed pillars, &c. Besides these, he made most of the tools used by joiners, clock-makers, opticians, mathematical instrument makers, &c. The limbs of arcs of his large equatorial instrument, sextant, quadrant, &c., he graduated with the nicest accuracy, by diagonal divisions into degrees and minutes. The telescopes he made use of were all of his own making, and the lenses ground, figured, and adjusted with his own hands. It was at this time that he assisted Mr. Flamsteed in calculating most of the tables in vol. 2 of his *Historia Cælestis*, and executed the curious drawings of the charts of all the constellations visible in our hemisphere, with the still

more excellent drawings of the planispheres both of the northern and southern constellations. And, though these were sent to be engraved at Amsterdam by a masterly hand, yet the originals far exceeded the engravings in point of beauty and elegance: these were published by Mr. Flamsteed, and both copies may be seen at Hóiton. The mathematician, says Dr. Hutton, meets with something extraordinary in Sharp's elaborate treatise of *Geometry Improved* (in 4to. 1717, signed A. S. Philomath.): 1st, by a large and accurate table of segments of circles, its construction and various uses in the solution of several difficult problems, with compendious tables for finding a true proportional part; and their use in these or any other tables exemplified in making logarithms, or their natural numbers, to sixty places of figures; there being a table of them for all primes to 1100, true to sixty-one figures. 2dly, His concise treatise of *Polyedra*, or *Solid Bodies of many Bases*, both the regular ones and others: to which are added twelve new ones, with various methods of forming them and their exact dimensions in surds, or species, and in numbers; illustrated with a variety of copper-plates, neatly engraved by his own hands. Also the models of these polyedra he cut out in box-wood with amazing neatness and accuracy. Indeed few or none of the mathematical instrument makers could exceed him, in exactly graduating or neatly engraving any mathematical or astronomical instrument, as may be seen in the equatorial instrument above-mentioned, or in his sextants, quadrants, and dials of various sorts; also in a curious armillary sphere, which, beside the common properties, has moveable circles, &c., for exhibiting and resolving all spherical triangles; also his double sector, and many other instruments, all contrived, graduated, and finished, in a most elegant manner, by himself. In short, he possessed at once a remarkably clear head for contriving, and an extraordinary hand for executing, any thing, not only in mechanics, but likewise in drawing, writing, and making the most exact and beautiful schemes or figures in all his calculations and geometrical constructions. The quadrature of the circle was undertaken by him for his own private amusement in 1699, deduced from two different series, by which the truth of it was proved to seventy-two places of figures; as may be seen in the introduction to Sherwin's *Tables of Logarithms*. In the same book may also be seen his ingenious improvements on the making of logarithms, and the constructing of the natural sines, tangents, and secants. He also calculated the natural and logarithmic sines, tangents, and secants, to every second in the first minute of the quadrant; the laborious investigation of which may be seen in the archives of the Royal Society, exhibiting his very neat and accurate manner of writing and arranging his figures, not to be equalled by the best penman now living. Mr. Sharp kept up a correspondence by letters with most of the eminent mathematicians and astronomers of his time, as Mr. Flamsteed, Sir Isaac Newton, Dr. Halley, Dr. Wallis, Mr. Hodgeson, Mr. Sherwin, &c., the answers to which letters are all written upon the backs, or empty spaces, of the letters

he received, in a short hand of his own contrivance. From a great variety of letters (of which a large chestful remain with his friends) from these and many other celebrated mathematicians, it is evident that Mr. Sharp spared neither pains nor time to promote real science. Indeed, being one of the most accurate and indefatigable computers that ever existed, he was for many years the common resource for Mr. Flamsteed, Sir Jonas Moore, Dr. Halley, and others, in all sorts of troublesome and delicate calculations. Mr. Sharp continued all his life a bachelor, and spent his time as reclusive as a hermit. He was of a middle stature, but very thin, being of a weakly constitution. He was remarkably feeble the last three or four years of his life. He died on the 18th of July 1742, aged ninety-one. In his retirement, at Little Hóiton, he employed four or five rooms or apartments in his house for different purposes, into which none of his family could enter at any time without his permission. He duly attended the dissenting chapel at Bradford, of which he was member, every Sunday; when he took care to be provided with plenty of halfpence, which he very charitably suffered to be taken singly out of his hand, held behind him during his walk to the chapel, by a number of poor people who followed him, without his ever looking back, or asking a question. Mr. Sharp was very irregular as to his meals, and remarkably sparing in his diet; so very much so, indeed, that the breakfast, dinner, and supper, have often remained untouched by him, when the servant has gone to remove what was left—so deeply engaged had he been in calculations.

SHARP (James), archbishop of St. Andrews, was born of a good family in Banffshire in 1618. He devoted himself very early to the church, and was educated for that purpose in the University of Aberdeen. When the solemn league and covenant was framed, in 1638, the learned men in that seminary, and young Sharp in particular, declared themselves decidedly against it. To avoid the insults and indignities to which he was subjected, in consequence of this conduct, he retired to England, where he contracted an acquaintance with some of the most celebrated divines in that country. At the commencement of the civil wars he returned to Scotland. During his journey thither, he accidentally met with Lord Oxenford, who, pleased with his conversation, invited him to his house. While he resided there, he became known to the earl of Rothes, who procured him a professorship at St. Andrew's. By the interest of the earl of Crawford he was soon after appointed minister of Crail. Sharp had always inclined to the cause of royalty, and had for some time kept up a correspondence with his exiled prince. After the death of the protector he began to declare himself more openly, and seems to have enjoyed a great share of the confidence of Monk, who was at that time planning the Restoration of Charles II. When that general marched to London, the presbyterians sent Sharp to attend him to support their interests. At the request of general Monk and the chief presbyterians in Scotland, Mr. Sharp was sent over to the king at Breda to procure from him, if possible, the establishment of

Presbyterianism. On his return, he assured his friends that 'he had found the king very affectionate to Scotland, and resolved not to wrong the settled government of the church; but he apprehended they were mistaken who went about to establish the Presbyterian government.' Charles was soon after restored without any terms. All the laws passed in Scotland since 1633 were repealed; the king and his ministers resolved at all hazards to restore prelacy. Mr. Sharp, who had been commissioned by the Scottish Presbyterians to manage their interests with the king, was prevailed upon to abandon the party; and, as a reward for his compliance, he was made archbishop of St. Andrew's. This conduct rendered him very odious in Scotland; he was accused of treachery and perfidy, and reproached by his old friends as a traitor and a renegade. The cruelties which were afterwards committed, which have been denominated absurd and wanton by one party, while by another they were considered as the necessary punishment of absolute rebellion, were in a great measure imputed to the archbishop, and rendered him still more detested. It may be well doubted whether these accusations were to their full intent well founded, though they will continue to be believed as long as any portion of the party and spirit of that age remains. They are the more easily credited, in that, having been formerly of the Presbyterian party, he might thence be induced, after forsaking them, to treat them with severity. He is accused of having, after the route at Pentland Hill, received an order from the king to stop the executions, and of having kept it for some time before he produced it to the council. There was one Mitchell, a preacher, who had formed the design of taking vengeance for these cruelties by assassinating the archbishop. He fired a pistol at him as he was sitting in his coach; but the bishop of Orkney, lifting up his hand at the moment, intercepted the ball. Though this happened in the midst of Edinburgh, the primate was so much detested, that nobody stopped the assassin; who, having walked leisurely home, and thrown off his disguise, returned, and mixed unsuspected with the crowd. Some years after, the archbishop observing a man eyeing him with keenness, suspected that he was the assassin, and ordered him to be brought before him. It was Mitchell. Two loaded pistols were found in his pocket. The primate offered him a pardon if he would confess the crime: the man complied; but Sharp, regardless of his promise, conducted him to the council. The council also gave him a solemn promise of pardon, if he would confess his guilt and discover his accomplices. They were much disappointed to hear that only one man was privy to his purpose, who was since dead. Mitchell was then brought before a court of justice, and ordered to make a third confession, which he refused. He was imprisoned for several years, and then tried. His own confession was urged against him. It was in vain for him to plead the illegality of that evidence, and to appeal to the promise of pardon previously given. The council took an oath that they had given no such promise; and Mitchell was condemned. Lauderdale, who at that time governed Scotland, would have pardoned him, but the pri-

mate insisted on his execution. Mitchell was accordingly executed. Sharp had a servant, one Carmichael, who by his cruelty had rendered himself particularly odious to the zealots. Nine men formed the resolution of waylaying him in Magus muir, about three miles from St. Andrew's. While they were waiting for this man, the primate himself appeared with very few attendants. This they looked upon as a declaration of heaven in their favor; and calling out 'the Lord has delivered him into hands,' they ran up to the carriage. They fired at him without effect; a circumstance which was afterwards imputed to magic. They then despatched him with their swords, regardless of the tears and intreaties of his daughter, who accompanied him. Thus fell archbishop Sharp, whose memory is even yet detested by the people of Scotland. His abilities were certainly good, and in the early part of his life he appears with honor and dignity; but his conduct afterwards was censured as cruel and insincere. His treatment of Mitchell was infamous, unjust, and vindictive. That he contributed greatly to the measures adopted against the Presbyterians is certain. That they were cruel and impolitic may be proved; nor did their effects cease with the measures themselves. The unheard-of cruelties exercised by the ministers of Charles II., against the adherents of the covenant, raised such a flame of enthusiasm and bigotry, as remained long unextinguished. It must be granted, at the same time, that the very essence of faction and insolent rebellion was combined with the religious prejudices of the covenanters, such as no government could tolerate; though it might have been opposed by happier means, and with better temper.

SHARP (John), D. D., archbishop of York, was descended from the Sharps of Little Horton, a family of Bladford Dale in Yorkshire; and was son of an eminent tradesman of Bradford, where he was born in 1644. He was educated at Cambridge, and in 1667 entered into orders, and became chaplain to Sir Heneage Finch, then attorney-general. In 1672 he was appointed archdeacon of Berkshire; in 1675 a prebendary in the cathedral church of Norwich; and 1676, rector of St. Bartholomew, London. In 1681 he was, by the interest of Sir Heneage Finch, then lord chancellor, made dean of Norwich; but in 1686 was suspended for vindicating the doctrine of the church of England in opposition to Popery. In 1688 he was sworn chaplain to king James II., and was also chaplain to king Charles II., and attended at the coronation of king James II. In 1689 he was declared dean of Canterbury; but always refused to fill up any of the vacancies made by the deprived bishops. Upon the death of Dr. Lamplugh he was promoted to the see of York. In 1702 he preached the sermon at the coronation of queen Anne; and was sworn of the privy council, and made lord-almoner to her majesty. He died at Bath in 1713; and was interred in the cathedral of York, where a monument is erected to his memory. His sermons, which were collected after his death, and published in 7 vols. 8vo., are justly admired.

SHARP (Gregory). See SHARPE.

SHARP (Granville), a modern English phi-

anthropist of considerable learning, was the son of archbishop Sharp, and born in 1743. He was educated for the bar, but obtained a place in the ordnance office, which he resigned at the commencement of the American war, the principles of which he did not approve. He now for the rest of his life resided in the temple, and led a life of private study. He became known to the public by his spirited defence of a poor negro named Somerset, who, having been brought to England by his master, was turned into the streets in a fit of sickness. When, by the charity of Mr. Sharp and his friends he had been restored to health, he was claimed again as property. The result was a series of law proceedings, which not only cleared Somerset from his tyrant, but determined that slavery could not exist in Great Britain. Having succeeded in this case, he interested himself in the condition of others, and at his own expense sent a number of wandering negroes to Sierra Leone, and soon after became the institutor of the society for the abolition of the slave trade. He was likewise the warm advocate of parliamentary reform, in support of which he published *A Declaration of the People's Natural Right to a Share in the Legislature*. This worthy individual, who attained the age of seventy-nine, died July 6th, 1813, active in benevolence to the last. His library was very extensive, and he possessed a curious collection of Bibles, which he presented to the British and Foreign Bible Society. His principal works are, *Remarks on the Uses of the Definitive Article in the Greek Testament, &c.*, to which is added a plain matter of fact Argument for the Divinity of Christ, 1798, 8vo.; *A Short Treatise on the English tongue; Remarks on the prophecies; Treatises on the Slave Trade, on Duelling, on the Law of Nature and Principles of Action in Man; Tracts on the Hebrew Language; Illustrations of the sixty-eighth Psalm, &c.* In regard to most of these productions, the impression is likely to be very temporary; but, as connected with a standing controversy, the *Remarks on the Definitive Article* may probably form a lasting manual in defence of the doctrine of the divinity of Christ, against the arguments of the Unitarians.

SHARP (William), a modern engraver of great skill, was the son of a gun-maker in the Minories, where he was born January 29th, 1740. His father, observing his early taste for drawing, apprenticed him to Mr. Longmate, an artist who practised what is technically termed bright engraving. At the expiration of his indentures, Sharp, then very young, married a Frenchwoman, and commenced business on his own account in Bartholomew Lane. Here he soon found himself capable of greater things than the engraving of dog-collars and door-plates, and resolutely applied himself to the higher branches of his art. One of his first essays was a plate of Hector, an old lion then in the Tower, from a drawing by himself. In 1782 he removed to the neighbourhood of Vauxhall; but, increasing in business and reputation, soon after took a larger residence in Charles Street, Middlesex Hospital. He became about this period a convert to the reveries of Mesmer and Emanuel Swedenborg, then to those of Richard Brothers,

of whom he engraved two separate plates, lest one should be insufficient to produce the requisite number of impressions which would be called for on the arrival of the predicted Millennium. When Brothers was incarcerated in a mad-house, Mr. Sharp attached himself to Joanna Southcote, of whose pretensions he continued a staunch supporter to the day of his death, although he survived considerably the object of his credulity, whom he persisted in affirming to be only in a trance. From London Mr. Sharp latterly resided at Chiswick, where he died of a dropsy in the chest, July 25th, 1824. He was at one time a member of the Society for Constitutional Information, and narrowly escaped being put on his trial for high treason, with Messrs. Horne Tooke, Holcroft, and Thelwall. He was arrested by order of government, and examined before the privy council, when it is said the naïveté of his answers and behaviour fully convinced ministers that a person of his description was little likely to engage in any conspiracy, and he was liberated after exciting a hearty laugh among the members of the board. Among the best productions of this artist are his *St. Cecilia*, after Domenichino; *Diogenes*, from a painting by Salvator Rosa; and *Ecce Homo*, from Guido; a *Madonna and child*, from Carlo Dolce; and a *Zenobia*, from a picture by Michel Angelo in the collection of Sir J. Reynolds. He also engraved several valuable portraits, and a large historical picture by Turnbull, of the *Sortie from Gibraltar* on the morning of November 27th, 1781.

SHARPE (Gregory), D. D., F. R., et A. S. S., a learned English divine, born in Yorkshire in 1713. After acquiring grammar at Hull, he came to Westminster, and studied under the celebrated Dr. Friend. A piece of juvenile indiscretion made his friends withdraw him from this seminary in 1731, and place him under the care of principal Blackwell in Aberdeen: where he also studied under professor William Duff and John Stewart. On his return to England, he entered into orders, and, after some inferior promotions, succeeded Dr. Nicolls, as master of the temple, and was appointed one of the king's chaplains. He died unmarried, January 8th, 1771. He published several respectable works, and many sermons: and his skill in the oriental languages was extensive.

SHARPS, in flour, the finer part of what are denominated POLLARDS. See that article.

SHARROCK (Robert), LL.D., a learned English divine and civilian; born at Adstock in Bucks, and educated at Oxford, where he graduated. He was afterwards appointed prebendary and archdeacon of Winchester, and rector of Bishop's Waltham in Hants. He wrote *A Treatise on the Propagation of Plants*; and some other works; and died in 1784.

SHASTAH, SHASTER, SHASTREM, or Bedang, the name of a sacred book, in high estimation among the Hindoos, containing all the dogmas of the religion of the Brahmins, and all the ceremonies of their worship: and serving as a commentary on the Vedam. The term Shaster denotes science or system; and is applied to other works of astronomy and philosophy, which have no relation to the religion of the Indians.

None but the Brahmins and rajahs of India are allowed to read the Vedam; the priests of the Banians, called Shuderers, may read the Shaster; and the people, in general, are allowed to read only the Paran or Pouran, which is a commentary on the Shaster. The Shaster is divided into three parts: the first containing the moral law of the Indians; the second the rites and ceremonies of their religion; and the third the distribution of the people into tribes or classes, with the duties pertaining to each class. The principal precepts of morality contained in the first part of the Shaster are the following:—That no animal be killed, because the Indians attribute souls to brutes as well as to mankind: that they neither hear nor speak evil, nor drink wine, nor eat flesh, nor touch any thing that is unclean; that they observe the feasts, prayers, and washings, which their law prescribes; that they tell no lies, nor be guilty of deceit in trade; that they neither oppress nor offer violence to one another; that they celebrate the solemn feasts and fasts, and appropriate certain hours of ordinary sleep for prayer; and that they do not steal, or defraud one another. The ceremonies contained in the second part of the Shaster are such as these:—that they wash often in the rivers, to wash away their sins; that they mark their forehead with red, in token of their relation to the Deity; that they present offerings and prayers unto certain trees; that they pray in the temples, make oblations to their pagodas, or idols, sing hymns, and make processions, &c.; that they make pilgrimages to distant rivers, especially to the Ganges, to wash themselves and make offerings; that they make vows to particular saints, according to their respective departments; that they render homage to the Deity at the first sight of the sun; that they pay their respect to the sun and moon, which are two eyes of the Deity; and that they treat with particular veneration those animals that are deemed more pure than others; as the cow, buffalo, &c., because the souls of men have transmigrated into these animals. The third part of the Shaster records the distribution of the people into four classes: the first being that of the Brahmins or priests, appointed to instruct the people; the second, that of the kutteris or nobles, who are the magistrates; the third that of the shuddries or merchants; and the fourth that of the mechanics. Each person is required to remain in the class in which he was born, and to pursue the occupation assigned to him by the Shaster. According to the Brahmins, the Shaster was imparted by God himself to Brahma, and by him to the Brahmins; who communicated the contents of it to the people. See GENTOOs, and HINDOOs. Modern writers have given us very different accounts of the antiquity and importance of the Shaster. Mr. Holwell, who has made considerable progress in the translation of this book, apprehends that the mythology as well as the cosmogony of the Egyptians, Greeks, and Romans, were borrowed from the doctrines of the Brahmins, contained in it, even to the copying of their exteriors of worship, and the distribution of their idols, though grossly mutilated and adulterated. With respect to the Vedam and Shaster, or scriptures of the Gentoos, Mr. Holwell

says that Vedam, in the Malabar language, signifies the same as Shaster in the Shanscrit; and that the first book is followed by the Gentoos of the Malabar and Coromandel coasts, and also of the island of Ceylon. The Shaster is followed by the Gentoos of the provinces of Bengal, and by all the rest of India, commonly called India Proper, along the course of the Ganges and Jumna to the Indus. Both these books (he says) contain the institutes of their respective religion and worship, as well as the history of their ancient rajahs and princes, often couched under fable. Their antiquity is contended for by the partisans of each; but he thinks that the similitude of their names, idols, and a great part of their worship, leaves little room to doubt, that both these scriptures were originally one. He adds, if we compare the great purity and chaste manners of the Shaster with the great absurdities and impurities of the Vedam, we need not hesitate to pronounce the latter a corruption of the former. With regard to the high original of these scriptures, the account of the Brahmins is as follows:—Brahma, or the Mighty Spirit, about 4866 years ago, assumed the form of man and the government of Hindostan. He translated the divineword (designed for the restoration of mankind, who had offended in a pre-existent state, and who are now in their last scene of probation, to the dignity from which they were degraded) out of the language of angels into the well known Shanscrit language, and called his translation the Chartah Bhade Shastah of Birmah, or the Six Scriptures of Divine Words of the Mighty Spirit. He appointed the Brahmins (so named from him) to preach the word of God; and the doctrines of the Shaster were accordingly preached in their original purity 1000 years. About this time there was published a paraphrase on the Chartah Bhade; and, about 500 years afterwards, a second exposition called the Aughtorrah Bhade Shasta, or Eighteen Books of Divine Words, written in a character compounded of the common Indostan and the Shanscrit. This innovation produced a schism among the Gentoos; on which occasion, it is said, those of Coromandel and Malabar formed a scripture of their own, which they pretended to be founded on the Chartah Bhade of Brahma, and called it the Vedam of Birmah, or Divine Words of the Mighty Spirit. The original Chartah Bhade was thrown aside, and at length wholly unknown, except to a few families; who can still read and expound it in the Shanscrit character. With the establishment of the Aughtorrah Bhade, and Vedam, which, according to the Gentoos account, is 3366 years ago, their polytheism commenced; and the principles of religion became so obscure, and their ceremonies so numerous, that every head of a family was obliged to keep a Brahmin as a guide both in faith and practice. Mr. Holwell is of opinion that the Chartah Bhade, or Original Scriptures, are not copied from any other system of theology promulgated to or obtruded upon mankind. The Gentoos do not attribute them to Zoroaster; and Mr. Holwell supposes that both Zoroaster and Pythagoras visited Indostan, not to instruct, but to be instructed. From the account of Mr. Dow we learn that the books which contain the religion and philosophy of the

Hindoos are distinguished by the name of Bedas ; that they are four in number, and said to be penned by the Divinity. Beda, he says, in the Shanscrit language, literally signifies science ; and these books treat not only of religion and moral duties, but of every branch of philosophic knowledge. The Brahmins maintain that the Bedas are the divine laws which Brimha, at the creation of the world, delivered for the instruction of mankind ; but they affirm that their meaning was perverted in the first age by the ignorance and wickedness of some princes, whom they represent as evil spirits who then haunted the earth. The first credible account we have of the Bedas is, that about the commencement of the Cal' Jug, of which era the year 1768 was the 4886th year, they were written, or rather collected, by a great philosopher and reputed prophet, called Beïss Muni, or Beïss the Inspired. The Hindoos, says Mr. Dow, are divided into two great religious sects (see HINDOOS) : the followers of the doctrine of Bedang, which is the original Shaster, or commentary upon the Bedas ; and those who adhere to the principles of the Neardirsen. The original Shaster is called Bedang, and is a commentary upon the Bedas. This book, he says, is erroneously called in Europe the Vedam. It is ascribed to Beïss Muni, and is said to have been revised some years after by one Serrider Swami, since which it has been reckoned sacred, and not subject to any farther alterations. Almost all the Hindoos of the Decan, and those of the Malabar and Coromandel coasts are of this sect. The followers of the Bedang Shaster do not allow that any physical evil exists ; they maintain that God created all things perfectly good ; but that man, being a free agent, may be guilty of moral evil, which may be injurious to himself, but can be of no detriment to the general system of nature. God, they say, being perfectly benevolent, never punished the wicked otherwise than by the pain and affliction which are the natural consequences of evil actions ; and hell, therefore, is no other than a consciousness of evil. The Neardirsen Shaster is said to have been written by a philosopher called Goutam, nearly 4000 years ago. The Brahmins, from Mr. Dow's account of their sacred books appear to believe invariable in the unity, eternity, omniscience, and omnipotence of God ; and their polytheism is no more than a symbolical worship of the divine attributes, which they divide into three classes. Under the name of Brimha they worship the wisdom and creative power of God ; under the appellation of Bishen his providential and preserving quality ; and under that of Shibah that attribute which tends to destroy. But similar apologies have been made by or for idolaters in all ages. As few of our readers may have an opportunity of perusing the Shaster, we shall, by way of specimen, subjoin a passage from the first chapter of it, which is a dialogue between Brimha, the Wisdom of the Divinity, and Narud, or Reason, the son of Brimha :—

Narud.—O father ! thou first of God ! thou art said to have created the world, and thy son Narud, astonished at what he beholds, is desirous to be instructed how all these things were made.

Brimha.—Be not deceived my son. Do not imagine that I was the creator of the world, independent of the Divine Mover, who is the great original essence and creator of all things. Look, therefore, only upon me as the instrument of the great Will, and a part of his being, whom he called forth to execute his eternal designs.

Narud.—What shall we think of God ?

Brimha.—Being immaterial, he is above all conception ; being invisible, he can have no form ; but, from what we behold in his works, we may conclude that he is eternal, omnipotent, knowing all things, and present every where.

Narud.—How did God create the world ?

Brimha.—Affection dwelt with God from all eternity. It was of three different kinds ; the creative, the preserving, and the destructive. The first is represented by Brimha, the second by Bishen, and the third by Shibah. You, O Narud ! are taught to worship all the three in various shapes and likenesses, as the Creator, the Preserver, and the Destroyer. The affection of God then produced power ; and power, at a proper conjunction of time and fate, embraced goodness, and produced matter. The three qualities then acting upon matter produced the universe, &c. Order rose over the universe. The seven heavens were formed, and the seven worlds were fixed in their places, there to remain till the great dissolution, when all things shall be absorbed into God.

Narud.—Shall not then the souls of good men receive rewards ? nor the souls of the bad meet with punishment ?

Brimha.—The souls of men are distinguished from those of other animals ; for the first are endued with reason, and with a consciousness of right and wrong. If therefore man shall adhere to the first, as far as his powers shall extend, his soul, when disengaged from the body by death, shall be absorbed into the divine essence, and shall never more reanimate flesh ; but the souls of those who do evil are not, at death, disengaged from all the elements. They are immediately clothed with a body of fire, air, and akash (a kind of undefined celestial element), in which they are for a time punished in hell. After the season of their grief is over, they reanimate other bodies ; but till they shall arrive at a state of purity they can never be absorbed into God.

Narud.—What is the nature of that absorbed state which the souls of good men enjoy after death ?

Brimha.—It is a participation of the divine nature, where all passions are utterly unknown, and where consciousness is lost in bliss !

Narud.—How long shall this world remain ?

Brimha.—Until the four lugs shall have revolved. Then Rudder (the same with Shibah, the destroying quality of God), with the ten spirits of dissolution, shall roll a comet under the moon, that shall involve all things in fire, and reduce the world into ashes. God shall then exist alone, for matter will be totally annihilated. Those who desire more information on this subject may consult Dow's History of Hindostan, Holwell's Interesting Historical Events, &c.

SHATTER, *v. a., v. n., & ?* Belg. *schetteren* ;
SHAT'ERY, *adj.* [*n. s.*] Teut. *scheiteren*.
 To break at once into pieces ; break so as to
 scatter the parts ; dissipate : be broken : a broken
 part : the adjective corresponding.

He raised a sigh so piteous and profound,
 That it did seem to *shatter* all his bulk,
 And rend his being. *Shakspeare.*
 Of bodies some are fragil, and some are tough and
 not fragil ; and, in the breaking, some fragil bodies
 break but where the force is ; some *shatter* and fly in
 many places. *Bacon.*
 Ye myrtles brown, with ivy never scar,
 I come to pluck your berries harsh and crude,
 And with forced fingers rude
Shatter your leaves before the mellowing year. *Milton.*

They escape dissolution, because they can scarce
 ever meet with an agent minute and swiftly enough
 moved to *shatter* or dissociate the combined parts.

A monarchy was *shattered* to pieces, and divided
 amongst revolted subjects, into a multitude of little
 governments. *Locke.*

Black from the stroke above, the smouldring pine
 Stands as a *shattered* trunk. *Thomson's Seasons.*

A man of a loose, volatile, and *shattered* humour,
 thinks only by fits and starts. *Norris.*

A brittle *shattery* sort of spar, found in form of a
 white sand chiefly in the perpendicular fissures
 amongst the ores of metal. *Woodward.*

Stick the candle so loose that it will fall upon
 the glass of the sconce, and break it into *shatters*. *Swift.*

SHAVE, *v. a.* } *Præterite* shaved ; *part.*
SHAVE'LING, *n. s.* } shaved or shaven. Sax.
SHA'VE, } *ceapan* ; Belg. *schavecn*
SHA'VING. } To pare ; pare close ; skim ;
 cut into thin slices : shaveling, a man shaved ; a
 friar : a shaver, a man closely attentive to his
 own interest ; a cheat : a shaving is a thin piece
 of any thing shaved off.

He that is to be cleansed shall *shave* off all his
 hair. *Leviticus.*

Of elves, there be no such things ; only by bald
 friars and knavish *shavelings* so feigned. *Spenser.*

Dost thou not know this *shaven* pate ? Truly it is
 a great man's head. *Knolles's History of the Turks.*

They fell all into the hands of the cruel mountain
 people, living for the most part by theft, and wait-
 ing for wrecks, as hawks for their prey : by these
shavers the Turks were stript of all they had. *Knolles.*

Zelim was the first of the Ottomans that did *shave*
 his beard : a bashaw asked, Why he altered the
 custom of his predecessors ? He answered, Because
 you bashaws may not lead me by the beard, as you
 did them. *Bacon.*

Make some medley of earth, with some other
 plants bruised or *shaven* in leaf or root. *Id.*

Take lignum aloes in gross *shavings*, steep them
 in sack, changed twice, till the bitterness be drawn
 forth ; then take the *shavings* forth, and dry them in
 the shade, and beat them to powder. *Id.*

Sweet bird !
 Thee, chauntress, oft the woods among
 I woo, to hear thy evening song ;
 And, missing thee, I walk unseen
 On the dry smooth *shaven* green. *Milton.*
 He *shaves* with level wing the deep ; then soars
 Up to the fiery concave towering high. *Id.*
 The *shavings* are good for the fining of wine. *Mortimer.*

The bending scythe
Shaves all the surface of the waving green. *Gay*
 I caused the hair of his head to be *shaved* off. *Wiseman.*

My lord
 Was now disposed to crack a jest,
 And bid friend Lewis go in quest ;
 This Lewis is a cunning *shaver*. *Swift.*

SHAW (Cuthbert), an English poet of consi-
 derable genius, but of humble origin, being the
 son of a shoe-maker. His poems, however, are
 far above mediocrity. But he had the fortune of
 Ferguson, not of Burns ; for, meeting with no
 generous patron, he died in great distress in 1771.

SHAW (Peter), M. D., an eminent English
 physician, was author of several medical treatises,
 and editor of the great Bacon's Philosophical
 Works. He died in 1763.

SHAW (Samuel), an eminent English noncon-
 formist divine of the seventeenth century, born
 at Repton in Derbyshire in 1635, and educated
 at the free school there. He afterwards became
 a member of St. John's College, Cambridge. In
 1658 he obtained from Oliver the Protector a
 presentation to the rectory of Long Wharton ;
 but was ejected, in 1622, for nonconformity. In
 1668 he was chosen master of the free-school at
 Ashby de la Zouch ; where he acquired great
 reputation, and educated many celebrated men
 of letters. He wrote a valuable work, entitled
 Immanuel ; and died in 1696.

SHAW (Stebbing), a modern divine and topo-
 grapher, was the son of a clergyman, and born
 in 1762, in Staffordshire. He was educated at
 Queen's College, Oxford, where he obtained a
 fellowship, and entered into orders : subsequently
 he became tutor to Sir Francis Burdett, with
 whom he made the tour of the Highlands. In
 1788 he travelled through the western counties of
 England, a narrative of which journey he pub-
 lished. In 1789 he commenced a periodical
 publication, entitled The Topographer, in month-
 ly parts, after which he gave the public his His-
 tory of Staffordshire, the first volume of which
 appeared in 1798 ; a part of the second followed
 in 1801, previously to which the author had suc-
 ceeded his father as rector of Hartshorn in Derby-
 shire. He died in the prime of life, the 28th of
 October, 1802.

SHAW (Thomas), D. D., and F. R. S., a learned
 English divine, celebrated for his Travels to
 Barbary and the Levant, was born in Kendal in
 Westmoreland about 1692. He was educated
 first at Kendal, afterwards at Queen's College,
 Oxford, where he graduated. He was appointed
 chaplain to the English consul at Algiers, in
 which station he continued for several years ; and
 thence took opportunities of travelling into dif-
 ferent parts. He returned in 1733 ; was elected
 F. R. S., and published the account of his travels
 at Oxford, folio, 1738. In 1740 he was nomi-
 nated principal of St. Edmund Hall, which was
 raised from a ruinous state by his munificence ;
 and was regius professor of Greek at Oxford
 until his death in 1751. Dr. Clayton, bishop of
 Clogher, having attacked these Travels in his
 Description of the East, Dr. Shaw published a
 supplement by way of vindication, which is in-
 corporated in the second edition of his travels,

prepared by himself, and published in 4to., 1757.

SHAW (George), M. D., and F. R. S., an eminent naturalist, was born at Bierton, in Buckinghamshire, of which parish his father was vicar, in 1751. At the age of fourteen he went to Magdalen-hall, Oxford, where he took his master's degree in 1772; after which he entered into orders, and became assistant to his father. His predilection for scientific pursuits, however, induced him to relinquish the clerical profession; and after studying at Edinburgh he took his degrees in medicine at Oxford; where also he stood candidate for the botanical professorship; but lost it in consequence of his having been ordained. He now settled in London; and, on the formation of the Linnæan society, was chosen one of the vice-presidents. While the Leverian Museum existed he delivered lectures there on natural history, and afterwards published a description of that collection in English and Latin. He also conducted the Naturalist's Miscellany, and the Speculum Linneum, or Linnæan Zoology. In 1789 he was chosen a fellow of the Royal Society, and in 1791 appointed librarian and assistant keeper of natural history in the British Museum; where, in 1807, he became the principal of that department. He died July 22d, 1813. His other works are,—1. The Zoology of New Holland. 2. *Cimelia Physica*. 3. General Zoology, 7 vols. 4to. 4. Zoological Lectures, 2 vols. 8vo. 5. An Abridgement of the Philosophical Transactions, in conjunction with Drs. Pearson, Hutton, &c. 6. Papers in the Linnæan Transactions.

SHAWLS. The most beautiful shawls come from Cashmere: their price is from 150 livres (about six guineas) to 1200 livres (or £50 sterling). In the Transactions of the Society for encouraging Arts, Manufactures, &c., for 1792, we are informed that a shawl counterpane, four yards square, manufactured by Mr. P. J. Knights of Norwich, was presented to the society, and that, upon examination, it appeared to be of greater breadth than any goods of equal fineness and texture that had ever before been presented to the society, or to their knowledge woven in this country. The shawls of Mr. Knights's manufacture can scarcely be distinguished from Indian shawls, though they can be afforded at one-twentieth part of the price. When the shawl is sixteen quarters square, Mr. Knights says, it may be retailed at £20; if it consisted of twelve quarters, and embroidered as the former, it will cost £15; if plain, with a fringe only, a shawl of sixteen quarters square may be sold at £8 8s.; if twelve quarters and fringed, at £6 6s. Mr. Knights maintains that his counterpane of four yards square is equal in beauty, and superior in strength, to the Indian counterpanes which are sold at 200 guineas. The principal consumption of this cloth is in train-dresses for ladies; as likewise for long scarfs, in imitation of the real Indian scarfs, which are sold from £60 to £30; whereas scarfs of this fabric are sold for as many shillings, and the ladies square shawls in proportion.

SHAWM', *n. s.* Teut. *schawm*. A hautboy; a cornet; written likewise shalm.

With trumpets also and *shawms*.

Psalms. Common Prayer.

SHE, *pron.* In oblique cases *her*. Sax. *reo*; Goth. *si*; old Eng. *sche*. The female pronoun demonstrative; the woman; the woman before mentioned; the female; sometimes used in contempt.

This once disclosed,

The ladies did change favours, and then we,
Following the signs, wooed but the sign of *she*.

Shakspeare

What, at any time, have you heard *her* say? *Id.*

The *shes* of Italy shall not betray

Mine interest and his honour. *Id. Cymbeline.*

Lady, you are the cruellest *she* alive,

If you will lead these graces to the grave,

And leave the world no copy. *Id. Twelfth Night.*

I would outstare the sternest eyes that look,

Pluck the young sucking culs from the *she* bear,

To win thee, lady. *Id. Merchant of Venice.*

He lions are hirsute, and have great manes; the
shes are smooth, like cats. *Bacon.*

She, of whom the ancients seemed to prophesy,

When they called virtues by the name of *she*;

She, in whom virtue was so much refined,

That for allay unto so pure a mind

She took the weaker sex. *Donne.*

The most upright of mortal men was he;

The most sincere and holy woman *she*. *Dryden.*

Stand it in Judah's chronicles confest,

That David's son, by impious passion moved,

Smote a *she* slave, and murdered what he loved. *Prior.*

SHEA, the name of a tree, from the fruit of which the negroes, in the interior parts of Africa, between the tropics, prepare a kind of vegetable butter. These trees are not planted by the natives, but are found growing naturally in the woods; and in clearing wood-land for cultivation every tree is cut down but the shea. The tree itself very much resembles the American oak; and the fruit, from the kernel of which, being first dried in the sun, the butter is prepared, by boiling the kernel in water, has somewhat the appearance of a Spanish olive. The kernel is enveloped in a sweet pulp, under a thin green rind; and the butter produced from it, besides the advantage of its keeping the whole year without salt, is whiter, firmer, and, Mr. Park says, to his palate, of richer flavor, than the best butter which he had tasted made from cows' milk. The growth and preparation of the commodity seem to be among the first objects of African industry in this and the neighbouring states; and it constitutes a main article of their inland commerce. In some places they dry the fruit in kilns, containing each about half a cart load of fruit, under which is kept up a clear wood fire. Our author, who saw the fruit in one of these kilns, was informed that in three days the fruit would be ready for pounding and boiling; and that the butter thus manufactured is preferable to that which is prepared from fruit dried in the sun; especially in the rainy season, when the process by insolation is always tedious, and oftentimes ineffectual. Might it not be worth while, if practicable, to cultivate shea trees in some of our West India Islands?

SHEAF, *n. s.* Plural sheaves. Sax. *reap*; Belg. *schoof*. A bundle of stalks of corn bound together; any bundle or collection held together.

These be the *sheaves* that honour's harvest bears,
The seed, thy valiant acts; the world, the field.
Fairfax.

He beheld a field,
Part arable and tilth; whereon were *sheaves*
New reaped: the other part sheep-walks and folds.
Milton.

The reaper fills his greedy hands,
And binds the golden *sheaves* in brittle bands.
Dryden.

She vanished;
The *sheaf* of arrows shook and rattled in the case.
Id.

In the knowledge of bodies, we must glean what
we can; since we cannot, from a discovery of their
real essences, grasp at a time whole *sheaves*, and in
bundles comprehend the nature of whole species.
Locke.

SHEAL, v. a. To shell. See **SHALE**.
Thou art a *shealed* peasecod.

Shakspeare. King Lear.

SHEAR, v. a. & n. s. } *Preter. shore or shear-*
SHEAR'ER, } *ed, part. pass. shorn.*
SHEAR'MAN. } *Sax. ꝥearan, ꝥeýnen.*

This word, says Johnson, is more frequently
written sheer; but sheer cannot analogically form
shore or shorn: shear, shore, shorn; as tear, tore,
torn. To clip or cut by interception between
two blades moving on a rivet: the plural shears
is the name of the instrument used: also a name
for wings (in Spenser) and for the age of sheep:
a shearer and shearmen is one who clips with,
or uses shears.

Laban went to *shear* his sheep. *Gen. xxxi. 19.*
Alas! thought Philoclea to herself, your *sheers*
come too late to clip the bird's wings that already is
flown away. *Sidney.*

Two sharp-winged *sheers*

Decked with divers plumes, like painted jays,
Were fixed at his back to cut his airy ways.
Spenser.

So many days, my ewes have been with young;
So many weeks, ere the poor fools will yeau;
So many months, ere I shall *shear* the fleece.
Shakspeare.

Why do you bend such solemn brows on me?
Think you I bear the *shears* of destiny?
Have I commandment on the pulse of life? *Id.*

Thy father was a plaisterer,
And thou thyself a *shearman*. *Id.*

When wool is new *shorn*, they set tails of water
by in the same room to increase its weight.

Bacon's Natural History.

To lay my head, and hollow pledge
Of all my strength, in the lascivious lap
Of a deceitful concubine, who *shore* me,
Like a tame wether, all my precious fleece. *Milton.*

Of other care they little reck'ning make,
Than how to scramble at the *shearers* feast,
And shove away the worthy bidden guest. *Id.*
The same ill taste of sense would serve to join
Dog foxes in the yoke, and *sheer* the swine.
Dryden.

The fates prepared their sharpened *sheers*. *Id.*

When the fleece is *shorn*,
Then their defenceless limbs the brambles tear;
Short of their wool, and naked from the *sheer*. *Id.*

When sheep is one *shear*, they will have two broad
teeth before; when two *shear*, four; when three, six;
when four, eight: and, after that, their mouths
break. *Mortimer.*

The sharp and toothed edge of the nether chap
strikes into a canal cut into the bone of the upper

and the toothed protuberance of the upper into a
canal in the nether: by which means he easily *sheers*
the grass whereon he feeds. *Grew.*

That people live and die, I knew,
An hour ago, as well as you;
And, if fate spins us longer years,
Or is in haste to take the *shears*,
I know we must both fortunes try,
And bear our evils, wet or dry. *Prior.*
Was he to be led as a lamb to the slaughter, pa-
tient and resigned as a sheep before her *shearers*?
Rogers.

Mayest thou henceforth sweetly sleep!
Shear, swains, oh *shear* your softest sheep,
To swell his couch! *Gay.*

Beneath the *shears* they felt no lasting smart;
They lost but fleeces, while I lost a heart. *Id.*
Fate urged the *shears*, and cut the sylph in twain,
But airy substance soon unites again. *Pope.*

O'er the congenial dust enjoined to *shear*
The graceful curl, and drop the tender tear. *Id.*
How happy should we be if we had the privilege
of employing the *sheers*, for want of a mint, upon
foreign gold, by clipping it into half-crowns!
Swift.

SHEARBILL, the rynchops nigra of Linnæus,
the black skimmer of Pennant and Latham, and
cutwater of Catesby. See **RYNCHORS**. Its bill
is much compressed; the edges are sharp; the
lower mandible is four inches and a half long;
the upper only three; the base red; the rest is
black; the forehead, chin, front of the neck, the
breast, and belly, are white; the head and whole
upper part of the body are black; the wings are
of the same color; the lower part of the inner
webs of the primaries is white; the tail is short,
and a little forked; the middle feathers are
dusky; the others are white on their sides; the
legs are weak and red; the length is one foot nine
inches; the extent is three feet seven inches. It
inhabits America from New York to Guiana. It
skims nimbly along the water, with its under
mandible just beneath the surface, feeding on the
insects and small fish as it proceeds. It frequents
also oyster banks, its bill being partly like that
of the oyster-catcher, adapted for preying on
those shell-fish.

SHEARD, n. s. Sax. ꝥearþ. A fragment.
It is now commonly written shard, and applied
to fragments of earthenware.

In the bursting of it, not a *sherd* to take fire from
the hearth, or to take water out of the pit.
Isaiah xxx. 14.

SHEATH, n. s. } Sax. ꝥæðe. The
SHEATHE, v. a. } case of any thing; the
SHEATH-WINGED, adj. } scabbard of a weapon:
SHEATH'Y. } to enclose in a scab-
bard; fit with a sheath; enclose: sheath-winged
is having sheaths over the wings: sheathy, form-
ing a sheath.

The dead knight's sword out of his *sheath* he drew,
With which he cut a lock off all their hair.

There was no link to color Peter's hat,
Walter's dagger was not come from *sheathing*.
Faerie Queene.

It were to be wished that the whole navy through-
out were *sheathed* as some are. *Shakspeare.*

Doth not each look a flash of lightning feel,
Which spares the body's *sheath*, yet melts the steel?
Raleigh.
Cleveland.

In his hair one hand he wreaths,
His sword the other in his bosom *sheaths*. *Denham*.
This, drawn but now against my sovereign's breast,
Before 'tis *sheathed* shall give him peace and rest.

Waller.

Those active parts of a body are of differing natures when *sheathed* up or wedged in amongst others, in the texture of a concrete, and when extricated from these impediments. *Boyle*.

Is this her hate to him, her love to me?

'Tis in my breast she *sheaths* her dagger now.

Dryden.

The leopard, and all of this kind as goes, keeps the claws of his forefeet turned up from the ground, and *sheathed* in the skin of his toes, whereby he preserves them sharp for rapine, extending them only when he leaps at the prey. *Grew*.

Swords by the lightning's subtle force distilled,
And the cold *sheath* with running metal filled.

Addison.

Other substances, opposite to acrimony, are called demulcent or mild, because they blunt or *sheath* those sharp salts; as pease and beans. *Arbuthnot*.

Some insects fly with four wings, as all vaginipennis or *sheathwinged* insects, as beetles and dorrs.

Browne.

With a needle put aside the short and *sheathy* cases on earwigs backs, and you may draw forth two wings. *Id*.

SHEATHING, in the sea language, is the casing that part of a ship which is to be under water with fir-board of an inch thick; first laying hair and tar mixed together under the boards, and then nailing them on, in order to prevent worms from eating the ship's bottom. Ships of war are now generally sheathed with copper; but copper sheathing is liable to be corroded by the action of salt water, and something is still wanting to effect this purpose. It is very probable that tar might answer very well. In the Cornish mines copper or brass pumps are often placed in the deepest parts, and are consequently exposed to the vitriolic or other mineral waters with which some of these mines abound, and which are known to have a much stronger effect on copper than sea water. These pumps are generally about six feet long, and are screwed together, and made tight by the interposition of a ring of lead, and the joinings are afterwards tarred. One of these pumps was so much corroded as to render it unfit for use; but the spots of tar, which by accident had dropped on it, preserved the parts they covered from the action of the water. These projected in some places more than a quarter of an inch; and the joints were so far defended, by the thin coat of tar, that it was as perfect as when it came from the hands of the manufacturer. If tar thus effectually defends copper from the acrimonious waters, can there remain a doubt of its preserving it from the much milder waters of the sea?

SHEATS, in a ship, are ropes bent to the clews of the sails; serving in the lower sails to haul aft the clews of the sail; but in topsails they serve to haul home the clew of the sail close to the yard-arm.

SHEAVE, in mechanics, a solid cylindrical wheel, fixed in a channel, and moveable about an axis, as being used to raise or increase the mechanical powers applied to remove any body.

SHEBA, or **SEBA** a country of Arabia Felix

or Abyssinia, which in the reign of Solomon king of Israel was governed by a queen named Makeda, or Balkis, who, hearing of that monarch's fame for wisdom and riches, waited on him personally, accompanied by a numerous train of attendants, and bringing a vast quantity of costly presents, as recorded in 1 Kings, x. According to the Abyssinian historians, this lady was not contented with the communication of Solomon's wisdom alone. Wishing to have a succession of wise monarchs in Sheba, she formed a closer connexion with him; and accordingly had a son by him named David whose posterity, according to Mr. Bruce, still continue to reign in Abyssinia or Ethiopia. See **ETHIOPIA**. The compilers of the Universal History are of opinion, as well as Mr. Bruce, that the queen of Sheba was really sovereign of Ethiopia. 'Ethiopia,' say they, 'is more to the south of Judea than the territory or kingdom of Saba in Arabia Felix; consequently it had a better claim than that country for the dominions of the princess whom our Saviour calls 'the queen of the south.' Ethiopia is styled the remotest part of the habitable world by Herodotus and Strabo; and therefore better agrees with what our Saviour has said of the queen of Sheba, that she 'came from the uttermost parts of the earth,' than Arabia. Nor can it be deemed a sufficient reply to this argument, that Arabia Felix was the uttermost part of the earth in respect to Judea, since it was bounded by the Red Sea; for that not only Egypt, but even Ethiopia, regions beyond that sea, were known to the Jews, and had a communication with them, both before and in our Saviour's time, is indisputably clear. Lastly, from what has been suggested, it appears no improbable conjecture that Judaism was not only known, at least in a part of Ethiopia, but nearly related to the established religion there, at the beginning of the apostolic age, if not much earlier. After all, these two opinions, so contrary in appearance, may be made consistent without great difficulty; since it is agreed that Arabia and Ethiopia have anciently borne the same name, been included during certain intervals in one empire, and governed by one prince. Part of the Arabs and Ethiopians had the same origin, and very considerable numbers of the Abaseni transported themselves from Arabia Felix into Ethiopia; a circumstance which sufficiently proves the intercourse that formerly subsisted between the Cushites or Ethiopians of Asia and Africa.'

SHEBA, or **SEBA**, the name of four patriarchs mentioned in Scripture, one or other of whom gave name to the above country, viz. the eldest of Cush, grandson of Ham and brother of Nimrod: Gen. x. 7. 2. The son of Raamah, and grandson of Cush: Gen. x. 7. 3. The son of Joktan: Gen. x. 28. And, 4. A son of Jokshan, and grandson of Abraham by Keturah. All these took up their residence in Arabia.

SHEBA, the son of Bichri, a Benjamite who attempted to raise a rebellion, after the death of Absalom; but was pursued by Joab, and beheaded by the people of Abel-Bethmaacah, to whom he had fled, and who delivered his head to Joab, who thereupon raised the siege of it. See **ABEL-BETHMAACAH**.

SHEBA, in geography, is the same with Beer-Sheba, i. e. The Well of the Oath (Gen. xxxi. 23); and where it is mentioned in Joshua, xix. 2, it should read 'Beer-Sheba or Sheba,' not 'and Sheba;' which makes exactly thirteen cities, as enumerated in the sixth verse. See BEER-SHEBA and BERSABE.

SHEBAT. See SEBAT.

SHEBBEARE (John), M. D., was born at Biddeford, in Devonshire, in 1709. His father was an attorney; but having small practice, and little fortune, he carried on also the business of a corn-factor. He had four children, two sons and two daughters. Of the sons, John was the eldest. The other son was called Richard, and entirely the reverse of his brother in disposition; he was bred to the sea, and died young. John received the rudiments of his education at the free school of Exeter, then conducted by the learned Mr. Zachary Mudge (author of an Essay for a new Version of the Psalms, and a volume of excellent Sermons), afterwards rector of St. Andrew in Plymouth. In the fifteenth or sixteenth year of his age young Shebbeare was bound an apprentice to a very eminent and worthy surgeon in his native town; in which situation he acquired a considerable share of medical knowledge. His genius for lampoon appeared at this early period, and he could not forbear from exercising it on his master. The chief marks, however, of the arrows of his wit were the gentlemen of the corporation: one or other, and sometimes all of them, were exposed in a libel upon the public posts. But, though the wiser part of them only laughed at these harmless trifles, yet some were more irritable, and many a prosecution was commenced against, but not one could fix itself upon him, so artfully had he contrived to conceal himself. He was also several times summoned to appear at the sessions, for daring to speak and write irreverently of the worshipful magistrates; but the laugh was always on the side of Shebbeare, nor could they ever come at his back, so closely had he fitted on his armour, with the whip of authority. When he was out of his time he set up trade for himself, and then showed a taste for chemistry; and soon after he married a very agreeable and amiable young woman of no fortune, but of a genteel family. Whether his insuperable propensity to satire deprived him of friends and of business, or that he spent too much in chemical experiments, we know not; but failing, at Biddeford, he removed about 1736 to Bristol, where he entered into partnership with a chemist, and never afterwards set his foot in his native town. In 1739 he attracted the attention of the public, by an epitaph to the memory of Thomas Coster, esq; member for Bristol; in which he has contrived to raise emotions of pity, grief, and indignation, to a very high degree. In 1740 he published a pamphlet on the Bristol waters; from which period there is a chasm in our author's life we are unable to fill up. In 1752 he was at Paris, where he obtained his degree. Until this time he appears to have lived in obscurity; but at an age when vigorous exertion usually subsides, he seems to have resolved to place himself in a conspicuous situation, whatever hazard might attend it, and

commenced a public writer with a degree of asperity and virulence for which it would be difficult to find a parallel even in the most intemperate times. To read over his works now, when the passions they then raised have subsided, we feel surprise at the effect they produced; and it is within the memory of many yet living that their influence was very considerable. In 1754 he began his career with the Marriage Act, a political novel; in which he treated the legislature with such freedom that it occasioned his being taken into custody; whence, however, he was soon released. The performances, however, most celebrated, were a series of Letters to the People of England, well calculated to make an impression on common readers; they were accordingly read with avidity, and circulated with diligence. On the publication of the Third Letter, warrants dated 4th and 8th of March, 1756, were issued by lord Holderness, to take up both Scott the publisher and the author. This prosecution, however, seems to have been dropped, and the culprit proceeded for some time unmolested having declared that he would write himself into a post or into a pillory; in the last of which he at length succeeded. On the 12th of January, 1758, a general warrant was signed by lord Holderness, to search for the author, printer, and publishers, of a wicked, audacious, and treasonable libel, entitled A Sixth Letter to the People of England, on the Progress of National Rum; in which is shown that the present grandeur of France and calamities of this nation are owing to the influence of Hanover on the councils of England. At this juncture government seem to have been effectually roused; for, having received information that a seventh letter was printing, by virtue of another warrant, dated January 23d, all the copies were seized and entirely suppressed. In Easter term an information was filed against him by Mr. Pratt, then attorney-general, afterwards lord Camden; in which the crown officer, in his application to the court, in express terms admitted a point afterwards much disputed, but now established, that of the jury's right to determine both the law and the fact in matters of libel. On the 17th of June the information was tried, when our author was found guilty; and on the 28th of November he was fined £5; ordered to stand in the pillory December 5th, at Charing Cross; to be confined three years; and to give security for his good behaviour for seven years, himself in £500, and two others in £250 each. On the day appointed that part of the sentence which doomed him to the pillory was put in execution, amidst a prodigious concourse of people assembled on the occasion. The under sheriff at that time happened to be Mr. Beardmore, who had sometimes been assisted by the doctor in writing the Monitor, a paper in its principles of the same tendency with the writings of the culprit, who consequently might expect every indulgence from the officer to whom the execution of his sentence was committed. Accordingly the defendant stood upon the platform of the pillory, unconfined, and at his ease, attended by a servant in livery, holding an umbrella over his head all the time; but his head, hands, neck, and arms, were not at all

confined, or put into the holes of the pillory. For this neglect of duty, Beardmore was fined £50, and suffered two months' imprisonment. Some time before he was tried for the above publication, the duchess of Queensbury, as heir of lord Clarendon, obtained an injunction in the court of chancery to stop the publication of the continuation of that nobleman's history; a copy of which had got into the hands of Francis Gwyn, esq., between whom and the doctor there had been an agreement to publish it. The care and expenses attending the ushering this work into the world were to be wholly Dr. Shebbeare's, who performed his part of the agreement, and caused it to be handsomely printed in quarto, with frequent reflections on, and allusions to recent events. On the injunction being obtained, Dr. Shebbeare was under the necessity of applying to the aid of law to recover the money expended by him in printing, amounting to more than £500. And it may be easily imagined that his circumstances were not improved by three years' imprisonment. During his confinement, he declares, he never received as presents more than twenty guineas from all the world, although receipts were issued for a first volume of the 'History of England, and of the Constitution thereof from its origin.' That volume he wrote, and had transcribed; but it was never published, for which he assigned various reasons, too tedious to be quoted. He said, however, that he did not intend to die until what he had proposed was finished; a promise which he was unable to perform. He was detained in prison during the whole time of the sentence, and with some degree of rigor; for when his life was in danger from an ill state of health, and he applied to the court of king's bench for permission to be carried into the rules a few hours in a day, though lord Mansfield acceded to the petition, yet the prayer of it was denied and defeated by judge Forster. But at the expiration of the time of his sentence, a new reign had commenced; and shortly afterwards, during the administration of Mr. Grenville, a pension was granted him by the crown. This he obtained by the personal application of Sir John Philips to the king, who, on that occasion, spoke of him in very favorable terms, which he promised to endeavour to deserve. From that event we find Dr. Shebbeare a uniform defender of the measures of government, and the mark against whom every opposer of administration threw out the grossest abuse. Even the friends of power were often adverse to him. Dr. Smollet introduced him, in no very respectful light, under the name of Ferret, in the novel of Sir Launcelot Greaves, and Mr. Hogarth made him one of the group in the third election print. Scarcely a periodical publication was without some abuse of him, which he seems to have in general had the good sense to neglect. In 1774, however, he defended himself from some attacks made upon him, and represented the character of king William in such a light as to excite the indignation of every whig in the kingdom. Early in life he appears to have written a comedy, which in 1766 he made an effort to get represented at Covent Garden. In 1768 he wrote the review of books in the Political Re-

gister for three months, and was often engaged to write for particular persons, with whom he frequently quarrelled when he came to be paid. This was the case with Sir Robert Fletcher. His pen seems to have been constantly employed, and he wrote with great rapidity, what certainly can now be read with little satisfaction. Though pensioned by government, he can scarcely be said to have renounced his opinions; for, in the pamphlet already mentioned, his abuse of the Revolution is as gross as in that for which he suffered the pillory. His violence defeated his own purpose. He was a strenuous supporter of the ministry during the American war, and published in 1775. An Answer to the Speech of Edmund Burke, esq., April 19th, 1774. And An Essay on the Origin, Progress, and Establishment of National Society; in which the principles of government, the definitions of physical, moral, civil, and religious liberty, contained in Dr. Price's Observations, &c., are fairly examined and refuted; together with a justification of the legislature, in reducing America to obedience by force. His publications, satirical, political, and medical, amount to thirty-four; besides a novel, entitled Lydia or Filial Piety; in which religious hypocrisy and blustering courage are very properly chastised. He died on the 1st of August, 1788, leaving, among those who knew him best, the character of a benevolent man; notwithstanding the violence of his party spirit.

SHECHEM, the son of Hamor, the Hivite, prince of the country so named, a contemporary of the patriarch Jacob, who purchased from him a field for a burial ground. Upon this occasion, or soon after it, the prince, falling in love with Dinah, the patriarch's only daughter, seduced her; but, contrary to the villanous practice of most seducers of female innocence, generously and honorably proposed marriage to her father and brethren. But through the vindictive villany of her two brethren, Simcon and Levi, a scene of hypocrisy, cruelty, and massacre, followed, which has scarcely a parallel, in the history of the most savage nations. Under pretence of religion, the prince, his father, and the whole men of the city were massacred; the women and children carried captives, and the city plundered. See Gen. xxxiv. The patriarch Jacob not only complained at the time, that their barbarity had made him to stink among the inhabitants, but pronounced a well merited curse upon the monsters, on his death bed, when he blessed the rest of his sons. Gen. xlix. 5-7.

SHECHEM, SCHECHEM, or SICHEM, a city of Canaan, the capital of the Shechemites, built by Hamor, and named after his son. It stood upon mount Ephraim, about ten miles north of Shiloh, and thirty or thirty-five north of Jerusalem, and belonged to the tribe of Ephraim. It was one of the cities of refuge, and is memorable for being the place where Joshua assembled the tribes, and gave them his last solemn advice, a short time before his death. Josh. xxiv. 1-28. On the death of Gideon, the Shechemites made his bastard son, Abimelech, king, and murdered seventy of his legitimate sons; but afterwards, rebelling against the usurper, he massacred the

people, razed their city, and burned their tower, with 1000 persons in it. See ABIMELECH. Shechem, however, was afterwards rebuilt, and about the end of Solomon's reign was a place of so much consequence that it became the scene of the revolution under his son Rehoboam, who was dethroned in it, and Jeroboam I. elected king, who repaired it, and made it his capital. It continued to be the capital of several of his successors, whose luxury and drunkenness procured it the name of Sychar, till the captivity of Shalmaneser. See SAMARIA. About A. M. 3870 it was taken, pillaged, and razed, by John Hyrcanus, king of the Jews. About A. D. 72 it was rebuilt by Vespasian, and named Flavia, and Neapolis. It is now called Naplouse or Nablous. See NABLOUS, and SAMARITANS. Near Jacob's Well, at this town, a church was erected about the ninth century, of which there are still relics.

SHECK'LATON, *n. s.* Fr. *sheklatone*. A kind of embroidery.

He went to fight against the giant in his robe of *sheklaton*, which is that kind of gilded leather with which they use to embroider the Irish jackets.

Spenser.

SHED, *v. a., v. n., & 3* Sax. *ſcedan*. To **SHED'DER**, *n. s.* [*n. s.*] effuse; to pour out; spill; scatter; let fall its parts: a slight covering.

Neither men putten newe wyn in to olde botels, ellis the botels ben to broken and destroyed, and the wyn *shed* out; but men putten newe wyn into newe botels and bothe ben kept.

Wicklif, Mutt. 9.

A *shedder* of blood shall surely die.

Ezek. xviii. 10.

For this is my blood which is *shed* for many, for the remission of sins.

Matt. xxvi. 28.

Though he his house of polished marble build,
With jasper floored, and carved cedar cieled;
Yet shall it ruin like the moth's frail cell,
Or *sheds* of reeds which summer's heat reple.

Sandys.

Trees that bring forth their leaves late, and cast them late, are more lasting than those that sprout their leaves early, or *shed* them betimes.

Bacon's Natural History.

Some think one general soul fills every brain,
As the bright sun *sheds* light in ev'ry star.

Davies.

The first Aletes born in lowly *shed*,
Of parents base, a rose sprung from a bride.

Fairfax.

In such a season born, when scarce a *shed*
Could be obtained to shelter him or me
From the bleak air.

Milton's Paradise Regained.

So all our minds with his conspire 'o grace
The Gentile's great apostle, and deface
Those state-obscuring *sheds*, that like a chain
Seen'd to confine and fetter him again.

Waller.

Around its entry nodding poppies grow,
And all cool simples that sweet rest bestow;
Night from the plants their sleepy virtue drains,
And passing *sheds* it on the silent plains.

Dryden.

Unhappy man! to break the pious laws
Of nature, pleading in his children's cause:
'Tis love of honour, and his country's good;
The consul, not the father, *sheds* the blood.

Id.

Those houses then were caves, or homely *sheds*
With twining osiers fenced, and moss their beds.

Id.

White oats are apt to *shed* most as they lie, and black as they stand.

Mortimer's Husbandry.

Then out he steals, and finds where oy the head
Their horse hung fasten'd underneath a *shed*.

Bttertton.

So the returning year be blest,
As his infant months bestow
Springing wreaths from William's brow;
As his summer's youth shall *shed*
Eternal sweets around Maria's head.

Prior.

In these lone walls, their days eternal bound,
These moss-grown domes with spiry turrets crown'd,
Where awful arches make a noon-day night,
And the dim windows *shed* a solemn light,
Thy eyes diffused a reconciling ray,
And gleams of glory brightened all the day.

Pope.

Here various kinds, by various fortunes led,
Commence acquaintance underneath a *shed*.

Swift.

Weak as the Roman chief, who strove to hide
His father's cot, and once his father's pride,
By casing a low *shed* of rural mould
With marble walls, and roof adorned with gold.

Harte.

SHEEN, *adj.* } Probably only the old pro-
SHEEN'Y. } nunciation of shine. Bright;
glittering; showy. A word now not in use.

When he was all dight, he took his way
Into the forest, that he might be seen
Of the wild beasts, in his new glory *sheen*.

Hubberd's Tale.

Now they never meet in grove or green,
By fountain clear, or spangled star-light *sheen*.

Shakspeare.

Up rose each warrior bold and brave,
Glistering in filed steel and armour *sheen*.

Fairfax.

By the rushy fringed bank,
Where grows the willow and the osier dank,
My sliding chariot stays,
Which set with agat, or the azure *sheen*,
Of turcois blue, and emerald green.

Milton.

Or did of late earth's sons besiege the wall
Of *sheeny* heaven.

Id.

SHEEN, EAST, a beautiful village of Surrey, in the parish of Mortlake, seated on an eminence, near the Thames, between Richmond and Roehampton.

SHEEN, WEST, an ancient hamlet of Surrey, in the parish of Richmond, which stood a quarter of a mile north-west of the old palace of Richmond, where Henry V. founded a Carthusian convent, in which Perkins Warbeck sought an asylum. Its last remnant, the ancient gateway, was taken down in 1770; when the whole hamlet, consisting of eighteen houses, was demolished, and the ground made into a lawn, and added to the king's enclosures.

These your unusual weeds to each part of you

Do give a life : no *shepherdess*, but Flora Peering in April's front. *Id. Winter's Tales.*

If that the world and love were young,

And truth in every *shepherd's* tongue,

These pretty pleasures might me move,

To live with thee and be thy love.

Raleigh.

A nobleman was a great grazier and *sheepmaster*.

Bacon.

The one carried a crosier of balm-wood, the other a pastoral staff of cedar like a *sheep-hook*.

Id. New Atlantis.

Thy gentry bleats, as if thy native cloth

Transfused a *sheepishness* into thy story, *Herbert.*

He beheld a field,

Part arable and tilth, whereon were sheaves

New reaped ; the other part *sheep-walks* and folds.

Milton.

Up to a hill anon his steps he reared,

From whose high top to ken the prospect round,

If cottage were in view, *sheepcot*, or herd ;

But cottage, herd, or *sheepcot*, none he saw. *Id.*

The like some *shepherdess* did shew,

Who sat to bathe her by a river's side. *Dryden.*

His doric dialect has incomparable sweetness in its clownishness, like a fair *shepherdess* in country russet. *Id.*

If you dare think of deserving our charms,

Away with your *sheephook*, and take to your arms.

Id.

Fire the bramble, snare the birds, and steep

In wholesome water-falls the fleecy *sheep*. *Id.*

Cast a *sheep's-eye* behind you : in before me. *Id.*

There are political *sheepbiters* as well as pastoral ; betrayers of public trust as well as of private.

L'Estrange.

Of substances there are two sorts of ideas ; one of single substances, as they exist separately, as a man, or *sheep*. *Locke.*

Wanting change of company, he will, when he comes abroad, be a *sheepish* or conceited creature.

Id.

Sheepishness and ignorance of the world, are not consequences of being bred at home. *Id.*

Without success, let a man be never so hardy, he will have some degree of *sheepishness*. *Grew.*

There happening a solemn festivity, such as the *sheephearings* used to be, David begs some small repast.

South.

The bear, the lion, terrors of the plain ;

The *sheepfold* scattered, and the *shepherd* slain.

Prior.

Lead up all those who heard thee, and believ'd ;

'Midst thy own flock, great *shepherd*, be received,

And glad all heaven with millions thou hast saved.

Id.

SHEEP, in zoology. See **OVIS** and **WOOL**. Among the various animals with which Divine Providence has stored the world, for the use of man, none is to be found more useful, or more valuable, than the sheep. It supplies us with food and clothing, and finds ample employment for our poor at all seasons of the year, whereby a variety of manufactures of woollen cloth is carried on without interruption to domestic comfort and loss to friendly society, or injury to health, as is the case with many other occupations. Every lock of wool that grows on its back contributes to the support of staplers, dyers, pickers, scourers, scribblers, carders, combers, spinners, spoolers, warpers, quillers, weavers, fullers, tuckers, burlers, shearmen, pressers, clothiers, and packers, who, one after another, tumble, and toss, and twist, and bake, and boil, this raw material, till they have each extracted a livelihood out of it ; and then comes the merchant, who, in his turn, ships it, in its highest state of improvement, to all quarters of the globe, whence he brings back every kind of riches to his country in return for this valuable commodity which the sheep affords. Besides this, the useful animal, after being deprived of his coat, produces another against the next year ; and, when we are hungry, and kill him for food, he gives us his skin to employ the feltmongers and parchment-makers, who supply us with a durable material for securing our estates, rights, and possessions ; and, if our enemies take the field against us, supplies us with a powerful instrument for rousing our courage to repel their attacks. When the parchment-maker has taken as much of the skin as he can use, the glue-maker comes after and picks up every morsel that is left, and therewith supplies a material for the carpenter and cabinet-maker, which they cannot do without, and which is essentially necessary before we can have elegant furniture in our houses ; tables, chairs looking-glasses, and a hundred other articles of convenience. And, in absence of the sun, the sheep supplies us with an artificial mode of light, whereby we preserve every pleasure of domestic society, and with whose assistance we can continue our work, or write or read, and improve our minds, or enjoy the social mirth of our friends. Another part of the slaughtered animal supplies us with an ingredient necessary for making good common soap, a useful store for producing cleanliness in every family, rich or poor. Even the horns are converted by the button-makers and turners into a cheap kind of buttons, tips for bows, and many useful ornaments. From the very trotters an oil is extracted useful for many purposes ; and they afford good food when baked in an oven. Even the bones are useful also ; for, by a late invention, they are found, when reduced to ashes, to be a useful and essential ingredient in the composition of the finest artificial stone in

ornamental work for chimney-pieces, cornices of rooms, houses, &c., which renders the composition more durable by effectually preventing its cracking. This meek inoffensive creature can feed where every other animal has been before him and grazed all they could find; and, if he takes a little grass on our downs or in our fields, he amply repays us in the richness of the manure which he leaves behind him. He protects the hands from the cold wintry blast, by providing them with the softest leather gloves. Every gentleman's library is also indebted to him for the neat binding of his books, for the sheath of his sword, and for cases for his instruments; in short, there is hardly any furniture or utensil of life but the sheep contributes to render either more useful, convenient, or ornamental.

Wales breeds a small hardy kind of sheep, which has the best tasted flesh, but the worst wool of all. Nevertheless it is of more extensive use than the finest Segovian fleeces; for the benefit of the flannel manufacture is universally known. The sheep of Ireland vary, like those of Great Britain; those of the south and east being large and their flesh rank; those of the north and the mountainous parts small, and their flesh sweet. The fleeces in the same manner differ in degrees of value. Scotland breeds a small kind in Shetland, and their fleeces are remarkably fine. But the new Leicestershire breed is perhaps one of the most profitable breeds in the island. See *RURAL ECONOMY*. Joseph Altom of Clifton, who raised himself from a plough-boy, was the first who distinguished himself in the midland counties of England for a superior breed of sheep. How he improved his breed is not known; but it was customary for eminent farmers in his time to go to Clifton in summer to choose and purchase ram-lambs, for which they paid two or three guineas. This man was succeeded by Mr. Bakewell; and it may reasonably be supposed that the breed, by means of Altom's stock, had passed the first stage of improvement before Mr. Bakewell's time. Still, however, it must be acknowledged that the Leicestershire breed of sheep owes its present high state of improvement to the ability and care of Mr. Bakewell.

This subject is pretty fully treated of under *RURAL ECONOMY*. The feeding sheep with turnips is a great advantage to the farmers. When they are made to eat turnips they soon fatten; but there is some difficulty in bringing this about. The old ones always refuse them at first, and will sometimes fast till almost famished; but the young lambs fall to at once. The common way of turning a flock of sheep at large into a field of turnips is very disadvantageous; for they would thus destroy as many in a fortnight as will keep them a whole winter. There are three other ways of feeding them on this food. The first is to divide the land into hurdles, and allow the sheep to come upon such a portion only at a time as they can eat in one day, and so advance the hurdles farther into the ground daily till all be eaten. This is infinitely better than the former random method; but they never eat them clean even this way, but leave the bottoms and outsides scooped in the ground: the

people pull up these indeed with iron crooks and lay them before the sheep again; but they are commonly so fouled that they do not care for them. The second way is by enclosing the sheep in hurdles, as in the former; but in this they pull up all the turnips which they suppose the sheep can eat in one day, and daily remove the hurdles over the ground whence they have pulled up the turnips: thus there is no waste, and less expense; for a person may in two hours pull up all those turnips, the remaining shells of which would have employed three or four laborers a day to get up with their crooks out of the ground trodden hard by the feet of the sheep; and the worst is that, as in the method of pulling up first, the turnips are eaten up clean; in this way, by the hook, they are wasted; the sheep do not eat any great part of them; and, when the ground comes to be tilled afterwards for a crop of corn, the fragments of the turnips are seen in such quantities on the surface that half the crop at least seems to have been wasted. The third method is to pull up the turnips, and remove them in a cart to some other place, spreading them on a fresh place every day; thus the sheep will eat them up clean, both root and leaves. The great advantage of this method is, when there is a piece of land not far off which wants dung more than that where the turnips grew, which perhaps is also too wet for the sheep in winter; and then the turnips will, by the too great moisture and dirt of the soil, sometimes spoil the sheep, and give them the rot. Yet such ground will often bring forth more and larger turnips than dry land; and, when they are carried off, and eaten by the sheep on ploughed land in dry weather, and on green sward in wet weather, the sheep will succeed much better, and the moist soil where the turnips grew, not being trodden by the sheep, will be much fitter for a crop of corn than if they had been fed with turnips on it. The expense of hurdles, and the trouble of moving them, are saved in this case, which will counterbalance at least the expense of pulling the turnips and carrying them to the places where they are to be eaten. They must always be carried off for oxen.

The manner in which Mr. Bakewell raised his sheep to the degree of celebrity in which they long stood, is, notwithstanding the recentness of the improvement, a thing in dispute; even among men high in the profession, and living in the very district in which the improvement has been carried on! This proprietor alone perhaps was in possession of the minutiae of his own improvement: it is most probable that no cross with any alien breed whatever was used; but that the improvement was effected by selecting individuals from kindred breeds, or varieties of long-woolled sheep, with which Mr. Bakewell was surrounded on almost every side, and by breeding in and in (i. e. from the same family) with this selection: solicitously seizing the superior accidental varieties produced; associating these varieties; and still continuing to select, with judgment, the superior individuals. It now remains to give a description of the superior class of individuals of this breed, especially ewes and wethers, in full condition, but not immoder-

ately fat. The rams will require to be distinguished afterwards. The head is long, small, and hornless, with ears somewhat long, and standing backward, and with the nose shooting forward. The neck thin, and clean toward the head; but taking a conical form; standing low, and enlarging every way at the base; the fore end altogether short. The bosom broad, with the shoulders, ribs, and chine extraordinarily full. The loin broad, and the back level. The haunches comparatively full towards the hips, but light downward; being altogether small in proportion to the fore parts. The legs of a moderate length; with the bones extremely fine. The bone throughout remarkably light. The carcase, when fully fat, takes a remarkable form; much wider than it is deep, and almost as broad as it is long. Full on the shoulder, widest on the ribs, narrowing with a regular curve towards the tail; approaching the form of the turtle nearer perhaps than any other animal. The pelt is thin, and the tail small. The wool is shorter than long wools in general, but much longer than the middle wools; the ordinary length of staple five to seven inches, varying much in fineness and weight. This breed surpasses every other in beauty of form; they are full and weighty in the fore quarters; and are remarkable for smallness of bone.

Mr. Marshall, who has been of so much benefit to agriculture and his country by his publications, informs us, in his *Rural Economy of the Midland Counties*, that he has seen a rib of a sheep of this breed contrasted with one of a Norfolk sheep: the disparity was striking; the latter nearly twice the size; while the meat which covered the former was three times the thickness: consequently the proportion of meat to bone was in the one incomparably greater than in the other. Therefore, in this point of view, the improved breed has a decided preference: for surely while mankind continue to eat flesh and throw away bone, the former must be, to the consumer at least, the more valuable.

The manner of managing sheep in Spain, a country famous for producing the best wool in the world, is as follows:—Here there are two kinds of sheep: the coarse-woolled sheep, which always remain in their native country, and are housed every night in winter; and the fine-woolled sheep, which are always in the open air, and travel every summer from the cool mountains of the northern parts of Spain, to feed in winter on the southern warm plains of Andalusia, Mancha, and Estremadura. Of these latter it appears, from accurate computation, that there are about 5,000,000, and that the wool and flesh of a flock of 10,000 sheep produced yearly about twenty-four reals a-head, or about the value of twelve English sixpences, one of which belongs to the owner, three to the king, and the other eight are allowed for the expenses of pasture, tythes, shepherds, dogs, salt, shearing, &c. In the sixteenth century the travelling sheep were estimated at 7,000,000; 10,000 sheep form a flock, which is divided into ten tribes, under the management of one person, who has absolute dominion over fifty shepherds and fifty dogs. M. Bourgoanne, a French gentleman, who resided many years in

Spain, and directed his enquiries chiefly to the civil government, trade, and manufactures of that country, gives the following account of the wandering sheep of Segovia. 'It is,' says he, 'in the neighbouring mountains that a part of the wandering sheep feed during the fine season. They leave them in October, pass over those which separate the two Castiles, cross New Castile, and disperse themselves in the plains of Estremadura and Andalusia. For some years past those of the two Castiles, which are within reach of the Sierra Morena, go thither to pass the winter; which, in that part of Spain, is more mild; the length of their day's journey is in proportion to the pasture they meet with. They travel in flocks from 1000 to 1200 in number, under the conduct of two shepherds; one of whom is called the mayoral, the other the zagal. When arrived at the place of their destination, they are distributed in the pastures previously assigned them. They return in April; and whether it be habit or natural instinct that draws them towards the climate, which at this season becomes most proper for them, the inquietude which they manifest might, in case of need, serve as an almanac to their conductors.' Mr. Arthur Young, in that patriotic work which he conducted with great industry and judgment, the *Annals of Agriculture*, gives us a very accurate and interesting account of the Pyrenean or Catalanian sheep. 'On the northern ridge, bearing to the west, are the pastures of the Spanish flocks. This ridge is not, however, the whole; there are two other mountains, quite in a different situation, and the sheep travel from one to another as the pasturage is short or plentiful. I examined the soil of these mountain pastures, and found it in general stony; what in the west of England would be called a stone brash, with some mixture of loam, and in a few places a little peaty. The plants are many of them untouched by the sheep; many ferns, narcissus, violets, &c., but burnet (*poterium sanguisorba*) and the narrow leaved plantain (*plantago lanceolata*) were eaten close. I looked for trefoils, but found scarcely any: it was very apparent that soil and peculiarity of herbage had little to do in rendering these heights proper for sheep. In the northern parts of Europe, the tops of mountains half the height of these (for we were above snow in July) are bogs; all are so which I have seen in our islands, or at least the proportion of dry land is very trifling to that which is extremely wet:—Here they are in general very dry. Now a great range of dry land, let the plants be what they may, will in every country suit sheep. The flock is brought every night to one spot, which is situated at the end of the valley on the river I have mentioned, and near the port or passage of Picada: it is a level spot sheltered from all winds. The soil is eight or nine inches deep of old dung, not at all enclosed: from the freedom from wood all round, it seems to be chosen partly for safety against wolves and bears. Near it is a very large stone, or rather rock, fallen from the mountain. This the shepherds have taken for a shelter, and have built a hut against it; their beds are sheep skins, and their door so small that they crawl in. I saw no place for fire; but they

have it, since they dress here the flesh of their sheep, and in the night sometimes keep off the bears by whirling fire brands: four of them belonging to the flock mentioned above lie here. I viewed their flock very carefully, and, by means of our guide and interpreter, made some enquiries of the shepherds, which they answered readily, and very civilly. A Spaniard at Venasque, a city in the Pyrenees, gives 600 livres French a-year for the pasturage of this flock of 2000 sheep. In winter he sends them into the lower parts of Catalonia, a journey of twelve or thirteen days, and when the snow is melted, in the spring, they are conducted back again. They are the whole year kept in motion, and moving from spot to spot, which is owing to the great range they every where have of pasture. They are always in the open air, never housed or under cover, and never taste of any food but what they can find upon the hills. Four shepherds, and from four to six large Spanish dogs, have the care of this flock; the latter are in France called the Pyrenees breed; they are black and white, of the size of a large wolf, a large head and neck, armed with collars stuck with iron spikes. No wolf can stand against them; but bears are more potent adversaries. But, as we have neither wolves nor bears in Britain, we need not quote Mr. Young's remarks on this subject. He adds respecting the sheep: 'They are in general polled, but some have horns; which in the rams turn backwards behind the ears and project half a circle forward; the ewes' horns turn also behind the ears, but do not project: the legs white or reddish; speckled faces, some white, some reddish; they would weigh fat, I reckon, on an average, from fifteen to eighteen pounds a quarter. Some tails short, some left long. A few black sheep among them: some with a very little tuft of wool on their foreheads. On the whole they resemble those on the South Downs; their legs are as short as those of that breed; a point which merits observation, as they travel so much and so well. Their shape is very good; round ribs and flat straight backs; and would with us be reckoned handsome sheep; all in good order and flesh. To be still better acquainted with them, I desired one of the shepherds to catch a ram for me to feel, and examine the wool, which I found very thick and good of the carding sort. I took a specimen of it, and also of a hoggit, or lamb of last year. In regard to the mellow softness under the skin, which, in Mr. Bakewell's opinion, is a strong indication of a good breed, with a disposition to fatten, he had it in a much superior degree to many of our English breeds, to the full as much so as the South Downs, which are for that point the best short-woolled sheep which I know in England. The fleece was on his back, and weighed, as I guessed, about eight pounds English; but the average, they say, of the flock is from four to five, as I calculated by reducing the Catalonian pound of twelve ounces to ours of sixteen, and is all sold to the French at 30s. the pound, French. This ram had the wool of the back part of his neck tied close, and the upper tuft tied a second knot by way of ornament; **nor do they ever shear this part of the fleece for**

that reason: we saw several in the flock with this species of decoration. They said that this ram would sell in Catalonia for twenty livres. A circumstance which cannot be too much commended, and deserves universal imitation, is the extreme docility they accustom them to. When I desired the shepherd to catch one of his rams, I supposed he would do it with his crook, or probably not be able to do it at all; but he walked into the flock, and, singling out a ram and a goat, bid them follow him, which they did immediately; and he talked to them while they were obeying him, holding out his hand as if to give them something. By this method he brought me the ram, which I caught, and held without difficulty.'

To find a proper composition for *marking* sheep is a matter of great importance, as great quantities of wool are every year rendered useless by the pitch and tar with which they are usually marked. The requisite qualities for such a composition are, that it be cheap, that the color be strong and lasting, so as to bear the changes of weather, and not to injure the wool. Dr. Lewis recommends for this purpose melted tallow, with so much charcoal in fine powder stirred into it as is sufficient to make it of a full black color, and of a thick consistence. This mixture, being applied warm with a marking iron, on pieces of flannel, quickly fixed or hardened, bore moderate rubbing, resisted the sun and rain, and yet could be washed out freely with soap, or ley, or stale urine. In order to render it still more durable, and prevent its being rubbed off, with the tallow may be melted an eighth, sixth, or fourth, of its weight of tar, which will readily wash out along with it from the wool.—Lewis's Com. Phil. Techn. p. 361.

The criteria of good and bad flesh, while the animal is alive, differ in different species, and are not properly settled in the same species. One superior breeder is of opinion that, if the flesh is not loose, it is of course good; holding that the flesh of sheep is never found in a state of hardness, like that of ill-fleshed cattle; while others make a four fold distinction of the flesh of sheep; as looseness, mellowness, firmness, hardness; considering the first and the last equally exceptionable, and the second and third equally desirable; a happy mixture of the two being deemed the point of perfection. The flesh of sheep when slaughtered is well known to be of various qualities. Some is composed of large coarse grains, interspersed with wide empty pores like a sponge; others of large grains, with wide pores filled with fat; others of fine close grains, with smaller pores filled with fat; and a fourth of close grains without any intermixture of fatness. The flesh of sheep when dressed is equally well known to possess a variety of qualities; some mutton is coarse, dry, and insipid; a dry sponge, affording little or no gravy of any color. Another sort is somewhat firmer, imparting a light colored gravy only. A third plump, short, and palatable; affording a mixture of white and red gravy. A fourth likewise plump and well flavored, but discharging red gravy and this in various quantities. Some mutton when dressed appears covered with a thick, tough,

parchment-like integument; others with a membrane comparatively fine and flexible. But these, and some of the other qualities of mutton, may not be wholly owing to breed, but in part to the age and the state of fatness at the time of slaughter. Examined in this light, whether we consider the degree of fatness, or their natural propensity to a state of fatness, even at an early age, the improved breed of Leicestershire sheep appear with many superior advantages. The degree of fatness to which the individuals of this breed are capable of being raised will perhaps appear incredible to those who have not had an opportunity of being convinced by their own observation. 'I have seen wedders,' says Mr. Marshall, 'of only two shear (two or three years old), so loaded with fat as to be scarcely able to make a run; and whose fat lay so much without the bone, it seemed ready to be shaken from the ribs on the smallest agitation. It is common for the sheep of this breed to have such a projection of fat upon the ribs, immediately behind the shoulder, that it may be easily gathered up in the hand as the flank of a fat ballock. Hence it has gained, in technical language, the name of the fore-flank; a point which a modern breeder never fails to touch, in judging of the quality of this breed of sheep. What is perhaps still more extraordinary, it is not rare for the rams, at least of this breed, to be 'cracked on the back;' that is, to be cloven along the top of the chine, in the manner fat sheep generally are upon the rump. This mark is considered as an evidence of the best blood. Extraordinary, however, as are these appearances while the animals are living, the facts are still more striking after they are slaughtered. At Litchfield, in February, 1785, I saw a fore-quarter of mutton, fattened by Mr. Princep of Croxall, which measured upon the ribs four inches of fat. It must be acknowledged, however, that the Leicestershire breed do not produce so much wool as most other long-wooled sheep.'

As the practice of *letting rams* by the season is become profitable, it may be useful to mention the method of rearing them. 'The principal ram-breeders,' says Mr. Marshall, 'save annually twenty, thirty, or perhaps forty ram-lambs; castration being seldom applied in the first instance to the produce of a valuable ram; for in the choice of these lambs they are led more by blood, or parentage, than by form; on which, at an early age, little dependence can be placed. Their treatment from the time they are weaned, in July or August, until the time of shearing, the first week in June, consists in giving them every indulgence of keep, in order to push them forward for the show; it being the common practice to let such as are fit to be let the first season, while they are yet yearlings, provincially 'sharhogs.' Their first pasture, after weaning, is pretty generally, I believe, clover that has been mown early, and has got a second time into head; the heads of clover being considered as a most forcing food of sheep. After this goes off, turnips, cabbages, colewort, with hay, and (report says) with corn. Something considerable depends on the art of making up, not lambs only, but rams of all ages. Fat, like charity,

covers a multitude of faults; and besides is the best evidence of their fattening quality which their owners can produce (i. e. their natural propensity to a state of fatness), while in the fatness of the sharhogs is seen their degree of inclination to fat at an early age. Fattening quality being the one thing needful in grazing stock, and being found in some considerable degree at least to be hereditary, the fattest rams are of course the best; though other attachments, well or ill placed, as to form or fashionable points, will perhaps have equal or greater weight in the minds of some men, even in this enlightened age. Such shearlings as will not make up sufficiently as to form and fatness are either kept on to another year to give them a fair chance, or are castrated or butchered while sharhogs.' From the first letting, about forty years ago, to the year 1780, the prices kept gradually rising from 15s. to a guinea, and from one to ten. In 1780 Mr. Bakewell let several at ten guineas each; and, what is rather inexplicable, Mr. Parkinson of Quarndon let one the same year for twenty-five guineas; a price which then astonished the whole country. From that time to 1786 Mr. Bakewell's stock rose rapidly from ten to 100 guineas; and that year he let two-thirds of one ram (reserving one-third of the usual number of ewes to himself) to two principal breeders, for 100 guineas each, the entire services of the ram being rated at 300 guineas! Mr. Bakewell making that year, by letting twenty rams only, more than £1000! Since that time the prices have been still rising; 400 guineas have been repeatedly given. Mr. Bakewell this year (1789) makes, says Mr. Marshall, 1200 guineas by three rams (brothers we believe); 2000 of seven; and of his whole letting, full 3000 guineas! Besides this extraordinary sum, made by Mr. Bakewell, there are six or seven other breeders who make from 500 to 1000 guineas each. The whole amount of moneys produced that year in the Midland counties, by letting rams of the modern breed for one season only, is estimated by those who are adequate to the subject at the almost incredible sum of £10,000.

The *diseases* to which sheep are subject are, rot, red-water, foot-rot and hoving, scab, dunt, rickets, fly-struck, flux, and bursting. The rot, which is a very pernicious disease, has of late engaged the attention of scientific farmers. But neither its nature nor its cause has yet been fully ascertained. Some valuable and judicious observations have, however, been made upon it, which may furnish an antidote for this malignant distemper, or be the means of leading others to some more efficacious remedy. Some have supposed the rot owing to the quick growth of grass or herbs that grow in wet places. But the constant practice of most farmers in the kingdom, who with the greatest security feed their meadows in the spring, when the grass shoots quick, and is full of juices, militates directly against this opinion. Mr. Arthur Young ascribes this disease to moisture. In confirmation of this opinion, which has been generally adopted, we are informed in the Bath Society papers (vol. 1. art. xlv.) by a correspondent, that there was a

paddock adjoining to his park which had for several years caused the rot in most of the sheep which were put into it. In 1769 he drained it, and from that time his sheep were free from this malady. But there are facts which render it doubtful that moisture is the sole cause. We are told the dry limed land in Derbyshire will produce the rot as well as water meadows and stagnant marshes; and that in some wet grounds sheep sustain no injury for many weeks. On dissecting sheep that die of this disorder, a great number of insects called flukes (see *FASCIOLA*), are found in the liver. That these flukes are the cause of the rot therefore is evident; but to explain how they come into the liver is not so easy. It is probable that they are swallowed by the sheep along with their food or drink, while in the egg state. The eggs deposited in the tender germ are conveyed with the food into the stomach and intestines of the animals, whence they are received into the lacteal vessels, carried off in the chyle, and pass into the blood; nor do they meet with any obstruction until they arrive at the capillary vessels of the liver. Here, as the blood filtrates through the extreme branches, answering to those of the vena porta in the human body, the discerning vessels are too minute to admit the impregnated ova, which, adhering to the membrane, produce those animalculæ that feed upon the liver and destroy the sheep. They much resemble the flat fish called plaice, are sometimes as large as a silver two-pence, and are found both in the liver and in the pipe (answering to that of the vena cava), which conveys the blood from the liver to the heart. It is therefore easy to conceive that sheep may, on wet ground especially, take multitudes of these ova or eggs in with their food; and, that the stomach and viscera of the sheep being a proper nidus for them, they of course hatch, and, appearing in their fluke or last state, feed on the liver of the animal, and occasion this disorder. It is a singular fact that no ewe ever has the rot while she has a lamb by her side. The reason of this may be, that the impregnated ovum passes into the milk, and never arrives at the liver. The rot is fatal to sheep, hares, and rabbits, and sometimes to calves, but never infests animals of a larger size. Miller says that parsley is a good remedy for the rot in sheep. Perhaps a strong decoction of this plant, or the oil extracted from its seeds, might be of service. Salt is also a useful remedy. It seems to be an acknowledged fact that salt marshes never produce the rot. Salt indeed is pernicious to most insects. Common salt and water expel worms from the human body; and sea-weed, if laid in a garden, will drive away insects; but if the salt is separated by steeping it in the purest spring-water for a few days it abounds with animalculæ of various species. Fisle, in his book of husbandry, informs us of a farmer who cured his whole flock of the rot by giving each sheep a handful of Spanish salt for five or six mornings successively. In wet and warm seasons the prudent farmer will remove his sheep from the lands liable to rot. Those who have it not in their power to do this, may give each sheep a spoonful of common salt, with the same quantity of flour, in a quarter of a pint

of water, once or twice a-week. When the rot is recently taken, the same remedy, given four or five mornings successively will in all probability effect a cure. The addition of the flour and water (in the opinion of Mr. Price of Salisbury) will not only abate the pungency of the salt, but dispose it to mix with the chyle in a more gentle and efficacious manner. A farmer of a considerable lordship in Bohemia, visiting the hot-wells of Carlsbad, related how he preserved his flocks of sheep from the mortal distemper which raged in the wet year 1769, of which so many perished. His preservative was very simple and very cheap:—‘He fed them every night, when turned under a shed, cover, or stables, with hashed fodder straw; and, by eating it greedily, they all escaped.’ ‘Red-water is a disorder most prevalent on wet-grounds. I have heard,’ says Mr. Arthur Young, ‘that it has sometimes been cured by tapping, as for a dropsy. This operation is done on one side of the belly towards the flank, just below the wool.’ ‘The foot-rot and hoving, which is very common on low fenny grounds, is cured by keeping the part clean, and lying at rest in a dry pasture.’ The scab is a cutaneous disease, owing to an impurity of the blood, and is most prevalent in wet lands or in rainy seasons. It is cured by tobacco-water, brimstone, and alum, boiled together, and then rubbed over the sheep. If only partial, tar and grease may be sufficient. But the simplest and most efficacious remedy for this disease was communicated to the society for the Encouragement of Arts, &c., by Sir Joseph Banks:—‘Take one pound of quicksilver, half a pound of Venice turpentine, half a pint of oil of turpentine, and four pounds of hog’s lard. Let them be rubbed in a mortar till the quicksilver is thoroughly incorporated with the other ingredients: for the proper mode of doing which, take the assistance of some apothecary. In using the ointment, begin at the head of the sheep, and, proceeding from between the ears along the back to the end of the tail, the wool is to be divided in a furrow till the skin can be touched; and, as the furrow is made, the finger slightly dipped in the ointment is to be drawn along the bottom of it, where it will leave a blue stain on the skin and adjoining wool: from this furrow similar ones must be drawn down the shoulders and thighs to the legs, as far as they are woolly; and, if the animal is much infected, two more should be drawn along each side parallel to that on the back, and one down each side between the fore and hind legs. Immediately after being dressed, it is usual to turn the sheep among other stock, without any fear of the infection being communicated; and there is scarcely an instance of a sheep suffering any injury from the application. In a few days the blotches dry up, the itching ceases, and the animal is completely cured: it is generally, however, proper not to delay the operation beyond Michaelmas. The *hippobosca ovina*, called in Lincolnshire sheep fagg, an animal well known to all shepherds, which lives among the wool, and is hurtful to the thriving of sheep both by the pain its bite occasions and the blood it sucks, is destroyed by this application, and the wool is not at all injured. Our wool buyers

purchase the fleeces on which the stain of the ointment is visible, rather in preference to others, from an opinion that the use of it having preserved the animal from being vexed either with the scab or faggs, the wool is less liable to the defects of joints or knots; a fault observed to proceed from every sudden stop in the thriving of the animal, either from want of food or from disease. This mode of curing is now so generally received that the scab, which used to be the terror of the farmers, and which frequently deterred the more careful of them from taking the advantage of pasturing their sheep in the fertile and extensive commons with which that district abounds, is no longer regarded with any apprehension: the most of them have their stock anointed in autumn, when they return from the common, whether they show any symptoms of scab or not; and, having done so, conclude them safe from infection. There are people who employ themselves in the business, and contract to anoint our large sheep at 5s. a score, insuring for that price the success of the operation; that is, agreeing, in case many of the sheep break out afresh, to repeat the operation gratis even some months afterwards.' The dunt is a distemper caused by a bladder of water gathering in the head. No cure for this has yet been discovered. The rickets is a hereditary disease for which no antidote is known. The first symptom is a kind of light headedness, which makes the affected sheep appear wilder than usual when the shepherd or any person approaches him. He bounces up suddenly from his laze, and runs to a distance, as though he were pursued by dogs. In the second stage the principal symptom is the sheep's rubbing himself against trees, &c., with such fury as to pull off his wool and tear away his flesh. 'The distressed animal has now a violent itching in his skin, the effect of a highly inflamed blood; but it does not appear that there is ever any cutaneous eruption or salutary critical discharge. In short, from all circumstances, the fever appears now to be at its height.' The last stage of this disease 'seems only to be the progress of dissolution, after an unfavorable crisis. The poor animal, as condemned by Nature, appears stupid, walks irregularly (whence probably the name rickets), generally lies, and eats little; these symptoms increase in degree till death, which follows a general consumption, as appears upon dissection of the carcase; the juices and even solids having suffered a general dissolution.' To discover the seat and nature of this disease, sheep that die of it ought to be dissected. This is said to have been done by one gentleman, Mr. Beal; and he found in the brain or membranes adjoining a maggot about a quarter of an inch long, and of a brownish color. A few experiments might easily determine this fact. The fly-struck is cured by clipping the wool off as far as infected, and rubbing the dry parts with lime or wood ashes; currier's oil will heal the wounds, and prevent their being struck any more; or they may be cured with care without clipping, with oil of turpentine, which will kill all the vermin where it goes; but the former is the surest way. The flux is another disease to which sheep are subject. The best remedy is

said to be, to house the sheep immediately when this distemper appears, to keep them very warm, and feed them on dry hay, giving them frequent glisters of warm milk and water. The cause of that distemper is either their feeding on wet lands, or on grass that is become mossy by the lands having been fed many years without being ploughed. When the farmer perceives his sheep-walks to become mossy, or to produce bad grass, he should either plough or manure with hot lime, making kilns either very near or in the sheep-walks, because the hotter the lime is put on the sweeter the grass comes up, and that early in the year. Bursting, or as it is called in some places the blast, attacks sheep when driven into fresh grass or young clover. They overeat themselves, foam at the mouth, swell exceedingly, breathe very quick and short, then jump up, and instantly fall down dead. In this case, the only chance of saving their life is by stabbing them in the maw with an instrument made for the purpose. The instrument is a hollow tube, with a pointed weapon passing through it. A hole is made with the pointed weapon; which is immediately withdrawn, and the hole is kept open by inserting the tube till the wind is discharged. Sheep are infested with worms in their nose called *æstrus ovis*, and produced from the egg of a large two-winged fly. See (ÆSTRUS. The frontal sinuses above the nose in sheep and other animals are the places where these worms live and attain their full growth. These sinuses are always full of a soft white matter, which furnishes these worms with a proper nourishment, and are sufficiently large for their habitation; and when they have here acquired their destined growth, in which they are fit to undergo their changes for the fly-state, they leave their old habitation, and, falling to the earth, bury themselves there; and, when these are hatched into flies, the female, when she has been impregnated by the male, knows that the nose of a sheep or other animal is the only place for her to deposit her eggs, in order to their coming to maturity. Mr. Vallisnieri, to whom the world owes so many discoveries in the insect class, is the first who has given any true account of the origin of these worms, though the creatures themselves were very early discovered. The fly produced from this worm has all the time of its life a very lazy disposition, and does not like to make any use either of its legs or wings. Its head and corselet together are about as long as its body, which is composed of five rings, streaked on the back; a pale yellow and brown are there disposed in irregular spots; the belly is of the same colors but they are there more regularly disposed, for the brown here makes three lines, one in middle and one on each side, and all the intermediate spaces are yellow. The wings are nearly of the same length with the body, and are a little inclined in their position, so as to lie upon the body: they do not, however, cover it; but a naked space is left between them. The ailerons, or petty wings, which are found under each of the wings, are of a whitish color, and perfectly cover the balancers, so that they are not to be seen without lifting up these. The fly will live two months after it is first produced, but will take no nourishment of

any kind; and possibly it may be of the same nature with butterflies, which never take any food during the whole time of their living in that state.—Reaumer, *Ilist. Ins.* vol. iv. p. 552, &c.

The following instructions for purchasing sheep may be useful to our country readers:—The farmer should always buy his sheep from a worse land than his own, and they should be big-boned, and have a long greasy wool, curling close and well. These sheep always breed the finest wool, and are also the most approved of by the butcher for sale in the market. For the choice of sheep to breed, the ram must be young, and his skin of the same color with his wool, for the lambs will be of the same color with his skin. He should have a large long body; a broad forehead, round, and well rising; large eyes; and straight and short nostrils. The polled sheep, that is, those which have no horns, are found to be the best breeders. The ewe should have a broad back; a large bending neck; small, but short, clean, and nimble legs; and a thick, deep wool covering her all over. To know whether they be sound or not the farmer should examine the wool that none of it be wanting, and see that the gums be red, the teeth white and even, and the brisket-skin red, the wool firm, the breath sweet, and the feet not hot. Two years old is the best time for beginning to breed; and their first lambs should not be kept too long, to weaken them by suckling, but be sold as soon as convenient. They will breed advantageously till they are seven years old. Farmers have a method of knowing a sheep's age, as a horse's is known, by the mouth. When a sheep is one shear, as they express it, it has two broad teeth before; when it is two shear it will have four, when three six, and when four eight. After this their mouths begin to break. The difference of land makes a very great difference in the value of sheep. The fat pastures breed straight tall sheep, and the barren hills and downs breed square short ones; woods and mountains breed tall and slender sheep; but the best of all are those bred upon new ploughed land and dry grounds. On the contrary, all wet and moist lands are bad for sheep, especially such as are subject to be overflowed, and to have sand and dirt left on them. The salt marshes are, however, an exception to this general rule, for their saltiness makes amends for their moisture; salt, by reason of its drying quality, being of great advantage to sheep.

Rams, previous to the season, are reduced from the cumbrous fat state in which they are shown. The usual time of sending them out is the middle of September. They are conveyed in carriages of two wheels with springs, or hung in slings, twenty or thirty miles a-day, sometimes to the distance of 200 or 300 miles. They are not turned loose among the ewes, but kept apart in a small enclosure, where a couple of ewes only are admitted at once. When the season is over, every care is taken to make the rams look as fat and handsome as possible. In the choice of ewes the breeder is led by the same criteria as in the choice of rams. Breed is the first object of consideration. Excellency in any species

or variety of live stock cannot be attained with any degree of certainty, let the male be ever so excellent, unless the females employed likewise inherit a large proportion of the genuine blood, be the species or variety what it may. Hence no prudent man ventures to give the higher prices for the Dishley rams, unless his ewes are deeply tintured with the Dishley blood. Next to breed is flesh, fat, form and wool. After the lambs are weaned, the ewes are kept in common feeding places, without any alteration of pasture, previous to their taking the ram. In winter they are kept on grass, hay, turnips, and cabbages. As the heads of the modern breeder are much finer than most others, the ewes lamb with less difficulty. The female lambs, on being weaned, are put to good keep, but have not such high indulgence shown them as the males, the prevailing practice being to keep them from the ram the first autumn. At weaning time, or previously to the admission of the ram, the ewes are culled, to make room for the thaves or shearlings, whose superior blood and fashion entitle them to a place in the breeding stock. In the work of culling, the ram-breeder and the mere grazier go by somewhat different guides. The grazier's guide is principally age, seldom giving his ewes the ram after they are four shear. The ram-breeder, on the contrary, goes chiefly by merit; a ewe that has brought him a good ram or two is continued in the flock so long as she will breed. There are instances of ewes having been prolific to the tenth or twelfth year; but in general the ewes of this breed go off at six or seven shear. In the practice of some of the principal ram-breeders, the culling ewes are never suffered to go out of their hands until after they are slaughtered, the breeders not only fattening them, but having them butchered, on their premises. There are others, however, who sell them; and sometimes at extraordinary prices. Three, four, and even so high as ten, guineas each have been given for these outcasts. There are in the flocks of several breeders ewes that would fetch at auction twenty guineas each. Mr. Bakewell is in possession of ewes which, if they were put up to be sold to the best bidder, would, it is estimated, fetch no less than fifty each; and perhaps, through the present spirit of contention, much higher prices. As to the time of putting the rams to the ewes, the farmer must consider at what time of the spring his grass will be fit to maintain them and their lambs, and whether he has turnips to do it till the grass comes; for very often both the ewes and lambs are destroyed by the want of food; or if this does not happen, if the lambs are only stinted in their growth by it, it is an accident that they never can recover. The ewe goes twenty weeks with lamb, and according to this it is easy to calculate the proper time. Where there are not enclosures to keep them in, they should yearn in January, that the lambs may be strong by May-day, and be able to follow the dam over the fallows and water-furrows; but the lambs that come so early must have a great deal of care taken of them; and so indeed should all other lambs at their first falling; else, while they are weak, the crows and magpies will pick their eyes out.

SHEEPHAVEN, a harbour on the north coast of the county of Donegal, Ireland, situated west of the Mulroy, and separated from it by a long and narrow peninsula. The surrounding country is mountainous and thinly inhabited; nor is there any town of consequence in the neighbourhood. Dunfanaghy, near Hornhead, is no more than a village, though ruins near it seem to indicate that it was formerly much larger. The siliceous sand found in this district is of excellent quality for making glass, and it is carried to Belfast for that purpose. 'About a century ago, an elegant edifice, according to the taste of that age,' says Dr. W. Hamilton, was built on the peninsula, between the harbours of Sheephaven and Mulroy, which at present stands 'like Tadmor of the east, the solitary wonder of a surrounding desert.' The gardens are totally denuded of trees and shrubs by the fury of the western winds; their walls, unable to sustain the mass of overbearing sands, have bent before the accumulated pressure; and, overthrown in numberless places, have given free passage to this restless enemy of all fertility. The courts, the flights of steps, the terraces, are all involved in equal ruin; and their limits only discoverable by tops of embattled walls, visible amid hills of sand. The mansion itself, yielding to the unconquerable fury of the tempest, approaches fast to destruction; the freighted whirlwind, howling through every avenue and crevice, bears incessantly along its drifted burden, which has already filled the lower apartments of the building, and begins now to rise above the once elevated thresholds. Fields, fences, villages, involved in common desolation, are reduced to one undistinguishable scene of sterile uniformity, and 1200 acres of land are said thus to have been buried within a short period in irrecoverable ruin.—Transactions of the Irish Academy, vol. vi.

SHEER, *adj.* Saxon. *reyn*. Pure; clear; unmingled: clean; quick; at once.

If she say, I am not fourteen pence on the score for *sheer* ale, score me up for the lying'st rogue in Christendom. *Shakspeare.*

Thrown by angry Jove

Sheer o'er the crystal battlements; from morn

To noon he fell: from noon to dewy eve,

A summer's day; and with the setting sun

Dropped from the zenith, like a falling star,

On Lemnos. *Milton.*

The sword of Satan with steep force to smite

Descending, and in half cut *sheer*. *Id.*

Sheer argument is not the talent of the man; little wrested sentences are the bladders which bear him up, and he sinks downright, when he once pretends to swim without them. *Atterbury.*

SHEERGOTTA, a town of Hindostan in the province of Bahar, stands at the foot of a steep and narrow pass through the Ramgur hills, being part of the great military road from Calcutta to Benares. It takes its name from the number of tigers which formerly infested the route. Long. 84° 55' E., lat. 24° 32' N.

SHEERHORN, a lofty mountain of Switzerland, in the canton of Uri, ten miles south-east of Altorf. It rises to the height of 10,700 feet, and at the top is divided into two parts. It is covered with glaciers of great extent. Long. 8° 40' 5" E., lat. 46° 49' 50" N.

SHEERNESS, a market-town on the north-west point of Sheppey-Island, where the Medway joins the Thames, forty-six miles and a half east from London, in the parish of Minster. In 1667 this place was taken by the Dutch. It has now a regular fortification and garrison, under a governor, lieutenant-governor, fort-major, and other officers, and such a line of heavy cannon, commanding the mouth of the river, as to bid defiance to any force that may attempt to pass it. The harbour, dock-yard, and public buildings have of late been much enlarged and improved; a chapel has also been erected at the expense of government. The town contains several good streets. Here is an ordnance-office, with apartments for the different officers, all ordnance stores being delivered here to the fleet stationed at the Nore; here is also a yard for building ships, and a dock intended chiefly for repairing. It has a neat chapel of ease to the mother church. Market on Saturday.

SHEERS, a name given to an engine used to hoist or displace the lower masts of a ship. The sheers employed for this purpose in the royal navy are composed of several long masts, whose heels rest upon the side of the hulk, and having their heads declining outward from the perpendicular, so as to hang over the vessel whose masts are to be fixed or displaced. The tackles, which extend from the head of the mast to the sheer-heads, are intended to pull in the latter toward the mast head, particularly when they are charged with the weight of a mast after it is raised out of any ship, which is performed by strong tackles depending from the sheer-heads. The effort of these tackles is produced by two capsterns, fixed on the deck for this purpose. In merchant ships this machine is composed of two masts or props, erected in the same vessel wherein the mast is to be planted, or whence it is to be removed. The lower ends of these props rest on the opposite sides of the deck, and their upper parts are fastened across, so as that a tackle which hangs from the intersection may be almost perpendicularly above the station of the mast to which the mechanical powers are applied. These sheets are secured by stays which extend forward and aft to the opposite extremities of the vessel.

SHEET, *n. s. & v. a.* Sax. *reæt*. A large broad piece of linen; any thing expanded; a single fold of such a thing: to furnish with sheets.

He saw heaven opened, and a vessel descending unto him, as a great *sheet*, knit at the four corners. *Acts* x. 11

If I die before thee, shroud me

In one of these same *sheets*. *Shakspeare*

As much love in rhyme

As could be crammed up in a *sheet* of paper,

Writ on both sides the leaf, margin and all. *Id.*

Like the stag, when snow the pasture *sheets*,

The bark of trees thou browsedst. *Id.*

The little word behind the back, and undoing whisper, like pulling off a *sheet-rope* at sea, slackens the sail. *Suckling*

Fierce Boreas drove against his flying sails, And rent the *sheets*. *Dryden.*

Some unequal bride in nobler *sheets*

Receives her lord. *Id.*

When I first put pen to paper, I thought all I should have to say would have been contained in one sheet of paper. *Locke.*

I let the refracted light fall perpendicularly upon a sheet of white paper upon the opposite wall. *Newton's Opticks.*

To this the following sheets are intended for a full and distinct answer. *Waterland.*

SHEET, in sea-language, a rope fastened to one or both the lower confines of a sail, to extend and retain it in a particular station. When a ship sails with a lateral wind, the lower corner of the main and fore-sail are fastened by a tack and a sheet; the former being to windward, and the latter to leeward; the tack, however, is entirely diffused with a stern-wind, whereas the sail is never spread without the assistance of one or both of the sheets. The stay-sails and studding-sails have only one tack and one sheet each; the stay-sail tacks are always fastened forward, and the sheet drawn aft; but the studding-sail tack draws the under clew of the sail to the extremity of the boom, whereas the sheet is employed to extend the inmost.

SHEFFIELD (John), duke of Buckingham, an eminent writer of the seventeenth and eighteenth centuries, of great personal bravery, and an able minister of state, was born about 1650. He lost his father at nine years of age, and his mother marrying lord Ossulston, the care of his education was left to a governor, who neglected it. Finding himself deficient in many parts of literature, he resolved to devote a certain number of hours every day to his studies; and thereby improved himself to a high degree of learning. He entered a volunteer in the second Dutch war; and was in that famous naval engagement where the duke of York commanded as admiral; on which occasion he behaved so gallantly that he was appointed commander of the Royal Catharine. He afterwards made a campaign in the French service under M. de Turenne. As Tangier was in danger of being taken by the Moors, he offered to head the forces which were then sent to defend it; and accordingly was appointed to command them. He was then earl of Mulgrave, and one of the lords of the bed-chamber to king Charles II. The Moors retired on the approach of the king's forces; and the result was the blowing up of Tangier. He continued in several great posts during the reign of king James II., till that unfortunate prince was dethroned. Lord Mulgrave, though he paid his respects to king William before he was advanced to the throne, yet did not accept of any post in the government till some years after. In the sixth year of William and Mary he was created marquis of Normanby. He was one of the most active and zealous opposers of the bill which took away Sir John Fenwick's life; and exerted the utmost vigor in carrying through the treason bill, and the bill for triennial parliaments. He had some considerable posts under king William, and enjoyed much of his favor and confidence. In 1702 he was sworn lord privy seal; and in the same year was appointed one of the commissioners to treat of an union between England and Scotland. In 1703 he was created duke of Normanby, and soon after duke of Buckingham.

In 1711 he was made steward of the household to queen Anne, and president of the council. During her reign he was but once out of employment; when he resigned, being attached to Tory principles. He was instrumental in the change of the ministry in 1710. A circumstance that reflects the highest honor on him is the vigor with which he acted in favor of the unhappy Catalans, who afterwards were so inhumanly sacrificed. He was survived by only one legitimate son (who died at Rome in 1735); but left several natural children. His worst enemies allow that he lived on very good terms with his last wife, natural daughter to king James II., the late duchess of Buckingham, a lady who always behaved with a dignity suitable to the daughter of a king. He died in 1721. He was admired by the poets of his age; by Dryden, Prior, and Garth. His *Essay on Poetry* was applauded by Addison, and his *Rehearsal* is still universally admired, as a piece of true and original satire. His writings were splendidly printed in 1723, in 2 vols. 4to; and have since been re-printed in 1729, in 2 vols. 8vo. The first contains his poems on various subjects; the second his prose works, which consist of historical memoirs, speeches in parliament, characters, dialogues, critical observations, essays, and letters. The edition of 1729 is castrated; some particulars relating to the Revolution in that of 1723 having given offence.

SHEFFIELD, a market-town in the West Riding of Yorkshire, at the junction of the rivers Don and Sheaf, thirty-six miles south of Leeds, and 162 N. N. W. of London, celebrated throughout Europe for all kinds of hardware, cutlery, and plated goods. It has a singular appearance, from its occupying a long hill, and extending over the adjoining valleys, being almost enveloped in the smoke from its numerous fire-engines, foundries, &c. The three churches, St. Peter's, St. Paul's, and St. James's, erected on a hill, have a fine effect; their spires overtop the whole town, and look still more majestic at a small distance, by the intervening atmosphere being almost continually loaded with sooty exhalations. The extent of the town each way is about three-quarters of a mile. The streets are in general wide, well-built, open, clean, and lighted by gas. The slaughter-houses are built close to the river. Over each of the rivers is a good stone bridge; that over the Don, called the Lady's Bridge, consists of three arches, and was widened and repaired in 1768. That over the Sheaf consists of one arch, erected in 1769. On the eastern side of the Sheaf stands the duke of Norfolk's hospital, erected in 1670, consisting of two quadrangles of eighteen chambers in each, for eighteen poor men, and eighteen poor women. It has a neat chapel. Here is another hospital, erected in 1703, for the benefit of sixteen poor cutlers' widows; and a good free grammar and charity schools. Here are nine different meeting-houses for dissenters, and a Roman Catholic chapel.

Between the rivers Don and Sheaf, in the north-eastern part of the town, anciently stood a castle of a triangular form; this castle surrendered to the parliament forces in 1644, and was demolished. The market-place, which is exten-

sive and commodious, was erected by the duke of Norfolk, who is nearly the sole proprietor of the town. Here is a neat theatre, and assembly room. In the south-east corner of Trinity church-yard is the old town-hall; a new town-house has lately been erected, handsomely built with stone. Here are also a general infirmary, commodious military barracks, and two excellent schools on the Bell and Lancasterian system. From the convenience of the rivers and adjoining coal mines, the whole of the heavy work has of late years been performed by machinery, and its workmen have made such improvements in their trade that they are now able to undersell every other market. The nature of their manufactures gives the town a very sombre appearance, and the houses all look black from the continual smoke. A canal has been cut to the verge of the town, which, with the navigation of the Don, conveys the manufactures of Sheffield to all parts of the kingdom. On the south side of Trinity church-yard is the cutlers' hall, erected in 1725. The corporation of cutlers are styled 'The Company of Cutlers of Hallamshire,' and is governed by a master, two wardens, and two assistants; but the public affairs of the town are under seven of the principal inhabitants, who are termed regents or collectors. The town is well supplied with water, by means of pipes, and at a moderate rate. Here are two banking-houses Markets Tuesday and Saturday. Fairs Tuesday after Whitsun week, and November 28th. The old church of the Holy Trinity, a fine ancient Gothic structure, is a vicarage. The new churches are curacies. Patron, the vicar.

SHEFFIELDIA, in botany; a genus of plants belonging to the class of pentandria, and to the order of monogynia. The corolla is bell-shaped; the filaments are ten, of which every second is barren. The capsule consists of one cell, which has four valves. There is only one species, viz. *S. repens*.

SHEIK, in the oriental customs, the person who has the care of the mosques in Egypt; his duty is the same as that of the imams at Constantinople. There are more or fewer of these to every mosque, according to its size or revenue. One of these is head over the rest, and answers to a parish priest with us; and has under him, in large mosques, the readers, and people who cry out to go to prayers; but in small mosques the sheik is obliged to do all this himself. In such it is their business to open the mosque, to cry to prayers, and to begin their short devotions at the head of the congregation, who stand rank and file in great order, and make all their motions together. Every Friday the sheik makes an harangue to his congregation.

SHEIK-BELLET, an officer in the oriental nations. In Egypt the sheik-bellet is the head of the city, and is appointed by the pacha. The business of this officer is to take care that no innovations be made which may be prejudicial to the Porte, and that they send no orders which may hurt the liberties of the people. But all his authority depends on his credit and interest, not his office: for the government of Egypt is of such a kind that often the people of the least power by their posts have the greatest influence; and a caia of the Janizaries or Arabs, and sometimes

one of their meanest officers, an oda basha, finds means, by his parts and abilities, to govern all things.

SHEK'EL, *n. s.* Heb. שֶׁקֶל. An ancient Jewish coin equal to four Attic drachms, or four Roman denarii, value about 2s. 6d. sterling.

The Jews, albeit they detested images, yet imprinted upon their *shekkel* on one side the golden pot which had the manna, and on the other Aaron's rod.

Camden.

The huge iron head six hundred *shekels* weighed, And of whole bodies but one wound it made: Able death's worse command to overdoe, Destroying life at once and carcase too. *Cowley.*

This coat of mail weighed five thousand *shekels* of brass. *Broome*

SHEKOABAD, a considerable town of Hindostan in the province of Agra. It was formerly fortified. The vicinity produces very fine indigo, in which, and cotton, it carries on a good trade. This town is said to have been founded by the unfortunate Dara Sheko, the elder brother of Aurungzebe. Long. 78° 38' E., lat. 27° 6' N.

SHELBY, a county of the United States, in Kentucky, bounded north by Henry, west by Bullet, east by Franklin, and south by Nelson. It is fertile, and copiously watered by the creeks which run into Salt River.

SHELBYVILLE, the principal town of Shelby county, Kentucky, situated on Brashan's Creek, twelve miles above its junction with Salt River.

SHELDON (Gilbert), archbishop of Canterbury, an eminent and munificent English prelate, born in 1598. He was entered of Trinity College, Oxford, in 1613, and in 1622 was elected fellow of All Souls, and became chaplain to lord Coventry, keeper of the great seal, who made him a prebendary of Gloucester, and recommended him to king Charles I. The king made him vicar of Hackney, and rector of Ickford and Newington. In 1635 he was chosen warden of All Souls. During the civil wars, he continued attached to the king, and attended as one of his commissioners at the treaty of Uxbridge, where he argued warmly for the king and the church. Hence he was afterwards imprisoned by the parliament for six months, and deprived of his wardenship and lodgings. He was liberated by the reforming committee, October 24th, 1648, on condition that he should not come within five miles of Oxford. On the Restoration he was replaced in his wardenship, made master of the Savoy, dean of the chapel royal, and bishop of London; and in 1663 archbishop of Canterbury. In 1667 he was chosen chancellor of the University of Oxford, but lost king Charles II.'s favor by honestly advising him to dismiss his mistress, Barbara Villiers. He died November 9th, 1677, aged eighty. He spent no less than £60,000 in public and private charities.

SHELF, *n. s.* Sax. scylf; Belg. scelf. A **SHELF**, *adj.* } board fixed to lay any thing on; a sand-bank or rock in the sea.

About his *shelves*

A beggarly account of empty boxes. *Shakspeare.*

Her chamber is aloft, far from the ground; And built so *shelving*, that one cannot climb it Without apparent hazard of his life. *Lu.*

SHELL, among miners, the same with what they otherwise call fast ground or fast country; being that part of the internal structure of the earth which they find lying even and in an orderly manner, and evidently retaining its primitive form and situation.

SHELLEY, Percy Bysshe, the eldest son of Sir Timothy Shelly, Sussex, was born at Field-place, in that county, August 4, 1792. He was sent to Eton, whence he was early removed to Oxford. This removal was owing to his eccentricity of character, which led him to neglect the studies and violate the rules of the school, and finally resulted in his expulsion from Oxford. His family, naturally offended with his conduct, and not less with his free opinions on matters of religion, was still further estranged by an ill-assorted marriage. The result was very unfortunate, for after the birth of two children, a separation took place by mutual consent; and the death of the lady soon after exposed him to much obloquy. On the decease of his first wife, he married Miss Godwin, daughter of the celebrated author of *Political Justice*, by Mary Wolstonecraft, and soon after retired to Marlow, in Buckinghamshire, where he wrote his *Revolt of Islam*. About this time, application was made by his family to deprive him of the guardianship of his two children, a boy and a girl, on the ground of his atheistical and sceptical notions, and certain dangerous opinions respecting the intercourse of the sexes. The application succeeded, principally owing to a juvenile production, called *Queen Mab*, written while at Oxford, and published without the consent of the author. This event caused him much uneasiness, and probably induced him to quit England, and repair, with his second wife and their children, to Italy, where he renewed an acquaintance with Lord Byron, to whom he had become known during a former visit to the continent. With him and Leigh Hunt, Shelley joined in a periodical miscellany, published in London, entitled *The Liberal*. This publication, which contained the *Vision of Judgment*, by Lord Byron, and other original productions, was interrupted by the untimely death of Mr. Shelley, who was drowned in his return from Leghorn to his house, on the gulf of Lerici, in the bay of Spezia, by the wreck of his sailing boat, in a sudden storm, July, 1822. A few days afterwards, the body was washed on shore near Via Reggio, and was subsequently reduced to ashes by his friends. Shelley's remains were deposited in the Protestant burial-ground at Rome. At the time of his decease, Mr. Shelley had nearly completed his thirtieth year. His principal works are *The Revolt of Islam*; *Alastor*, or the Spirit of Solitude; *The Cenci*, a tragedy (see *Cenci Beatrice*); *Adonias*; *Hellas*; *Prometheus Unbound*; and a posthumous volume of poems.

SHELL, *n. s., v. a., &* Saxon *reyll*, *reall*;
SHELL-DUCK, [*v. n.*] Belg. *schelle*. The
SHELL-FISH, } crustaceous covering
SHELLY, *adj.* } of certain animals and
 vegetables; covering of an egg; the outer part of any thing; hence a musical instrument (in poetic language); a superficial part: to shell is, to

take out of a shell; to fall off as broken shells; to cast the shell: a shell-duck is a kind of wild duck: shell-fish, fish protected by shells; shelly, abounding in, or consisting of, shells.

Think him a serpent's egg,
 Which hatched would, as his kind, grow mischievous,
 And kill him in the shell. *Shakspeare. Julius Cæsar.*

Changed loves are but changed sorts of meats;
 And, when he hath the kernel eat,
 Who doth not throw away the shell? *Donne.*

Her women wear
 The spoils of nations in an ear;
 Changed for the treasure of a shell,
 And in their loose attires do swell.
Ben Jonson's Catiline.

Albion
 Was to Neptune recommended;
 Peace and plenty spread the sails;
 Venus, in her shell before him,
 From the sands in safety bore him.
Dryden's Albion.

Less than a god they thought there could not dwell
 Within the hollow of that shell,
 That spoke so sweetly. *Dryden.*

Whatever we fetch from underground is only what is lodged in the shell of the earth. *Locke.*

To preserve wild ducks, and *shellducks*, have a place walled in with a pond. *Mortimer's Husbandry.*

SHELLS, in natural history, are hard crustaceous, or bony coverings, with which certain animals are defended, and thence called shell fish. See *PHYSIOLOGY* and *CONCHOLOGY*.

M. Herissant, in the *Memoirs of the Academy of Sciences*, 1766, suggested that the structure of shells was organical. In the numerous experiments that he made on an immense number, and a very great variety, of animal shells, he constantly found that they were composed of two distinct substances; one of which is a cretaceous or earthy matter; and the other appeared, from many experiments made upon it by burning, distillation, and otherwise, to be evidently of an animal nature. These two substances he dexterously separated from each other by a very easy chemical analysis; by the gentle operation of which they were exhibited distinctly to view, without any material alteration from the action of the solvent, or instrument employed for that purpose. On an entire shell, or a fragment of one contained in a glass vessel, he poured a sufficient quantity of the nitrous acid, considerably diluted either with water or spirits of wine. After the liquor has dissolved all the earthy part of the shell (which may be collected after precipitation by a fixed or volatile alkali), there remains floating in it a soft substance, consisting of innumerable membranes of a retiform appearance, and disposed in different shells, in a variety of positions, which constitutes the animal part of it. This, as it has not been affected by the solvent, retains the exact figure of the shell; and, on being viewed through a microscope, exhibits satisfactory proofs of a vascular and organical structure. He shows that this membranous substance is an appendix to the body of the animal, or a continuation of the tendinous fibres that compose the ligaments by which it is

S H E L L S.

fixed to its shell; and that this last owes its hardness to the earthy particles conveyed through the vessels of the animal, which fix themselves into, and incrust, as it were, the meshes formed by the reticular filaments of which this membranous substance is composed. In the shell called porcelaine, in particular, the delicacy of these membranes was so great, that he was obliged to put it into spirit of wine, to which he had the patience to add a single drop of spirit of nitre day by day, for the space of two months; lest the air generated, or let loose by the action of the acid on the earthy substance, should tear the compages of its fine membranous structure into shatters; as it certainly would have done in a more hasty and less gentle dissolution. The delicate reticulated film left after this operation had all the tenuity of a spider's web; and accordingly he does not attempt to delineate its organisation. In other shells he employed even five or six months in demonstrating the complicated membranous structure of this animal substance by this kind of chemical anatomy. In general, however, the process does not require much time.

The singular regularity, beauty, and delicacy in the structure of the shells of animals, and the variety and brilliancy in the coloring of many of them, at the same time that they strike the attention of the most incurious observers, have at all times excited philosophers to enquire into and detect, if possible, the causes and manner of their formation. But the attempts of naturalists, ancient and modern, to discover this process, have constantly proved unsuccessful. M. de Reaumur hitherto appears alone to have given a plausible account, at least, of the formation of the shell of the garden-snail in particular, founded on a course of very ingenious experiments, related in the *Mem. de l'Acad.* 1709. He then endeavours to show that this substance is produced merely by the perspirable matter of the animal condensing and afterwards hardening on its surface, and accordingly taking the figure of its body, which has performed the office of a mould to it; in short, that the shell of a snail, and, as he supposed, of all other animals possessed of shells, was only the product of a viscous transudation from the body of the animal, containing earthy particles united by mere juxtaposition. This hypothesis, however, is liable to very great and insurmountable difficulties, if we apply it to the formation of some of the most common shells: for how, according to this system, it may be asked, can the oyster, for instance, considered simply as a mould, form to itself a covering so much exceeding its own body in dimensions?

On this subject Dr. Thomson has the following remarks in his *System of Chemistry*, vol. iv. p. 366—368. 'The crustaceous coverings of animals, as of echini, crabs, lobsters, prawns, and craw-fish, and also the shells of eggs, are composed of the same ingredients as bones (see BONES); but in them the proportion of carbonate of lime far exceeds that of phosphate. Thus 100 parts of lobster crust contain sixty carbonate of lime; fourteen phosphate, and twenty-six cartilage; 100 parts of crawfish crust

contain sixty carbonate of lime, twelve phosphate of lime, and twenty-eight cartilage; 100 parts of hen's egg shells contain 89.6 carbonate of lime, 5.7 phosphate of lime, and 4.7 animal matter. Hatchett found traces of phosphate of lime also in the shells of snails. The shells of sea animals may be divided into two classes. The first has the appearance of porcelain, their surface is enamelled, and their texture is often slightly fibrous. Mr. Hatchett has given them the name of porcellaneous shells. The second kind of shells is known by the name of mother-of-pearl. It is covered with a strong epidermis, and below it lies the shelly matter in layers. The shell of the fresh water mussel, mother-of-pearl, heliotis iris, and turbo olearius, are instances of these shells.'

Of the many singular configurations and appearances of the membranous part of different shells, which are described in M. Herissant's memoir, and are delineated in several well executed plates, we shall mention only, as a specimen, the curious membranous structure observed in the laminae of mother-of-pearl, and other shells of the same kind, after having been exposed to the operation of the author's solvent. Beside the great variety of fixed colors, with which he found the animal filaments of these shells adorned, the shell presents a succession of rich and changeable colors, the production of which he explains from the configurations of their membranes. These brilliant decorations are produced at a very small expense. The membranous substance is plaited and rumpled in such a manner that its exterior laminae, incrustated with their earthy and semi-transparent matter, form an infinite number of little prisms, placed in all kinds of directions, which refract the rays of light, and produce all the changes of color observable in these shells. With respect to the figures and colors of shells, river shells have not so agreeable or diversified a color as the land and sea shells; but the variety in the figure, colors, and other characters of sea shells, is almost infinite. The number of distinct species in the cabinets of the curious is very great; and doubtless the deep bottoms of the sea, and the shores yet unexplored, contain multitudes still unknown to us. It is rare to find any two shells exactly alike in all respects. This wonderful variety, however, is not all the produce of one sea or one country. Bonani observes that the beautiful shells come from the East Indies and from the Red Sea. The sun, by the great heat that it gives to the countries near the line, exalts the colors of the shells produced there, and gives them a lustre and brilliancy that those of colder climates generally want.

Of fossil shells, or those buried at great depths in the earth, some are found remaining almost entirely in their native state, but others are variously altered by being impregnated with particles of stone and of other fossils; in the place of others there is found mere stone or spar, or some other native mineral body, expressing all their lineaments in the most exact manner, as having been formed wholly from them, the shell having been first deposited in some solid matrix, and thence dissolved by very slow degrees, and

this matter left in its place, on the cavities of stone and other solid substances, out of which shells had been dissolved and washed away, being afterwards filled up less slowly with these different substances, whether spar or whatever else; these substances, so filling the cavities, can necessarily be of no other form than that of the shell, to the absence of which the cavity was owing, though all the nicer lineaments may not be so exactly expressed. Besides these, we have also in many places masses of stones formed within various shells; and these having been received into the cavities of the shells while they were perfectly fluid, and having therefore nicely filled all their cavities, must retain the perfect figures of the internal part of the shell, when the shell itself should be worn away or perished from their outside. The various species we find of these are, in many genera, as numerous as the known recent ones: and as we have in our own island, not only the shells of our own shores, but those of many other very distant ones, so we have also many species, and those in great numbers, which are, in their recent state, the inhabitants of other, yet unknown seas and shores. The cockles, mussels, oysters, and the other common bivalves of our own seas, are very abundant: but we have also an amazing number of the nautilus kind, particularly of the nautilus græcorum, which, though a shell not found living in our own or any neighbouring seas, yet is found buried in all our clay pits about London and elsewhere; and the most frequent of all fossil shells in some of our counties are the conchæ anomia, which yet we know not of in any part of the world in their recent state. Of this sort also are the cornua ammonis and the gryphitæ, with several of the echinitæ and others. The exact similitude of the known shells, recent and fossil, in their several kinds, will by no means suffer us to believe that these, though not yet known to us in their living state, are, as some have idly thought, a sort of *lusus naturæ*. It is certain that, of the many known shores, very few, not even those of our own island, have been yet carefully searched for the shell-fish that inhabit them; and as we see in the nautilus græcorum an instance of shells being brought from very distant parts of the world to be buried here, we cannot wonder that yet unknown shores, or the unknown bottoms of deep seas, should have furnished us with many unknown shell-fish, which may have been brought with the rest; whether that were at the time of the general deluge (see *DELUGE*), or the effect of any other catastrophe of a like kind, or by whatever other means, to be left in the yet unhardened matter of our stony and clayey strata.

Shells are subject to several imperfections, natural and accidental. The natural defects are the effects of age or sickness in the fish. Connoisseurs pretend to be able to distinguish a shell taken up with the fish alive from one found on the shores; they call the first a living, the second a dead shell; and say that the colors are always much fainter in the dead shells. Shells are also subject to other deformities, such as morbid cavities, or protuberances. When the shell is valuable, these faults may be hid, and

much added to the beauty of the specimen, without injuring it as an object of natural history, which should always be the great end of collecting these things. The cavities may be filled up with mastic, dissolved in spirit of wine, or with isinglass; these substances must be either colored to the tinge of the shell, or else a pencil dipped in water colors must finish them up to the resemblance of the rest; and then the whole shell being rubbed over with gum-water, or with the white of an egg, scarcely any eye can perceive the artifice: the same substances may also be used to repair the battered edge of a shell, provided the pieces chipped off be not too large. And, when the excrescences of a shell are faulty, they are to be taken down with a fine file.

On the coast of *Guinea* there is a prodigious quantity of that small species of porcelain which is used there as money; and there is another species all over white: the women make bracelets of these, and the people of the *Levant* adorn their hair with them. The coast of *Zanguebar* is very rich in shells; particularly large porcelains of great beauty; the *nux maris*, or sea-nut, and all the species of *nautili*. The *Canary* isles abound with the *murices*; *Madeira* abounds with *echini*; and the *auris marina* is nowhere more abundant. The *Red Sea* is beyond all other parts of the world abundant in shells; scarcely any kind is wanting there.

America affords many very elegant shells. *Panama* is famous for cylinders or rhombi, good porcelains, and a very fine species of *dolium*, or *concha globosa* called the *Panama purple shell*. About *Brasil*, and in the Gulf of *Mexico*, there are *murices* and *dolia* of extreme beauty; also a great variety of porcelains, *Purpuræ*, *pectens*, *nerita*, *bucardia*, or heart-shells, and elegant limpets. The isle of *Cayenne* affords one of the most beautiful of the *buccinum* kind, and the *Midas ear* is found principally about this place. *Jamaica* and *Barbadoes* have their shores covered with porcelains, *chamæ*, and *buccina*: and at *St. Domingo* there are almost all the same species of shells that we have from the *East Indies*; only they are not quite so beautiful. The pearl oyster is found also, but smaller than in the *Persian Gulf*. At *Martinico* there are in general the same shells as at *St. Domingo*. About *Canada* are found the violet *chamæ*; and the lakes of that country abound with mussels of very elegant pale blue and pale red colors. On the *Great Bank of Newfoundland* the principal kind are mussels of considerable beauty. About *Carthage* there are many mother-of-pearl shells. The island of *Magellan* furnishes us with a very remarkable species of mussels, and several very elegant species of limpets, particularly the *pyramidal*.

The shores of *Asia* furnish us with the pearl oysters and scallops in great perfection. About *Amboyna* are found the most beautiful specimens of the cabbage shell, the *arrosor*, the *ducal mantle*, and the coral oysters, or echinated oysters: also a great variety of extremely beautiful mussels, *tellinæ*, and *volutæ*; some fine *buccinums*, and the shell called the *Ethiopian crown*, in its greatest perfection. The *dolia*, the *murices*, and the *cassandræ*, are also found on these

coasts in great beauty. Many elegant snails and screw-shells are also brought thence: and the serapion and spider shells. The Maldive and Philippine Islands, Bengal, and the coast of Malabar, abound with the most elegant of all the species of snails, and furnish many other kinds of shells in great abundance and perfection. China abounds in the finest species of porcelain shells, and has also a great variety of beautiful snails. Japan furnishes us with all the thicker and larger bivalves; and the isle of Cyprus is famous above all other parts of the world for the beauty and variety of the patella or limpet.

Our own *British* coasts produce also very pretty shells. About Plymouth are found oysters, mussels, and solens, in great abundance: and there, and on most of our other shores, are numbers of the *aures marinae* and *dentalia*, with pectens, which are excellent food; and many elegant species of the *chamæ* and *tellinæ* are fished up about Scarborough, &c. Ireland affords great numbers of mussels, and some very elegant scallop-shells; and the pholades are frequent on most of our shores. We have also great variety of the *buccina* and *cochleæ*, some *volutæ*: and, on the Guernsey coast, a peculiarly beautiful snail, called the Guernsey snail.

The ports of Marseilles, Toulon, and Antibes, in France, are full of *pinna marinae*, mussels, *tellinæ*, and *chamæ*. The coasts of Bretagne afford great numbers of the *conchæ anatifera* and *poussepieds*; they are found on old rotten boards, on sea substances, and among clusters of sponges. The other parts of France, as Rochelle, Dunkirk, Brest, St. Maloes, and others, furnish oysters excellent for the table, but of the common kind, and of no beauty in their shells; great numbers of mussels are also found there; and the common *tellinæ*, the onion-peel oysters, the solens, and *conchæ anatifera*, are also frequent there. At Granville there are found very beautiful pectens, and some of the cordiform or heart-shells.

The *fresh water* shells are found much more frequently, and in much greater plenty than the sea kinds; there is scarcely a pond, a ditch, or a river of fresh water in any part of the world in which there are not found vast numbers of these shells with the fish living in them. All these shells are small, and they are of very little beauty, being usually of a plain grayish or brownish color. Our ditches afford us *chamæ*, *buccina*, *neritæ*, and some *patellæ*; but the Nile and some other rivers furnished the ancients with a species of *tellina* which was large and eatable, and so much superior to the common sea *tellina* in flavor, that it was commonly named *tellina regia*, i. e. the royal *tellina*. We have a small species of *buccinum* common in our fresh waters, which is very elegant, and always has its operculum in the manner of the larger *buccina*; a small kind of mussel is also very common, which is so extremely thin and tender that it can hardly be handled without breaking. The large fresh water mussel, called the horse mussel, is well known: and the size sufficiently distinguishes it from all other fresh water shells.

The Mediterranean and Northern ocean contain a great variety of shells, and many of very

remarkable elegance and beauty. The gulf of Tarentum affords great variety of purple porcelains, nautili, and elegant oysters; the coasts of Naples and Sardinia afford the same, and with them a vast number of the solens of all the known species. Sicily is famous for a very elegant kind of oyster which is white all over; *pinna marinae* and porcelains are also found in great plenty there, with *tellinæ* and *chamæ* of many species. Corsica is famous, beyond all other places, for vast quantities of the *pinna marinae*; and many other very beautiful shells are found there. (Lister. Hist. Conchyl.) About Syracuse are found the gondola shell, the alated *murex*, and a great variety of elegant snails, with some of the *dolia* and *neritæ*. The Adriatic Sea is less furnished with shells than the rest of these seas. Mussels and oysters of several species are however found there, and some of the cordiform or heart-shells: there are also some *tellinæ*. About Ancona there are vast numbers of the *pholades* buried in stone (see *PIOLAS*); and the *aures marinae* are particularly frequent about Puzzoli.—(Bonani, Recreat. Ment. et Ocul).

The coasts of Spain and Portugal afford much the same species of shells with the East Indies, but they are greatly inferior in beauty. There are, according to Tavernier and others, some rivers in Bavaria in which there are found pearls of a fine water. About Cadiz there are very large *pinna marinae*, and some fine *buccina*. The isles of Majorca and Minorca afford a great variety of extremely elegant shells. The *pinna marinae* are also very numerous there, and their silk is wrought into gloves, stockings, and other things. The Baltic affords many beautiful species, particularly an orange-colored pecten, or scallop shell, which is not found in any other part of the world.

In collecting shells it is most advisable, whenever it can be done, to get those which have in them the living animals; because we shall thus obtain the natural history of the animals, and the shells themselves in their natural beauty, and the full glow of their colors. Shells should be also procured from the deeper parts of their resorts, and immediately after storms on the sea beaches and shores; because, by being much exposed to the sun, their colors fade, and they are liable to other accidents that injure them. To kill the fish that inhabits them M. Da Costa advises to give them a quick dip in boiling water, and, when they are cooled, to lay them in cold water till they are cleaned; and in this operation they should not be touched with aquafortis, or any other acid, nor exposed to the heat of the fire and sun. The art of polishing shells arrived but lately at its present state of perfection. Among the immense variety of shells, some are taken up out of the sea, or found on its shores, in all their perfection and beauty; with a natural polish superior to any thing that art could give. In others, where the beauties are latent, art is to be called in; and the outer veil being taken off all the internal beauties appear. Among the shells found naturally polished are the porcelains, or cowries; the cassanders; the *dolia*, or *conchæ globosæ*, or tuns; some *buccina*, the *volutæ*, and the cylinders, or olives

or as they are generally, though improperly, called, the rhombi. But there are several other genera, in which most of the species are taken up naturally rough and covered with a coarse outer skin. The naturalists insist upon having all their shells in their native and genuine appearance as they are found when living at sea; but the ladies will have all such polished. But both kinds of collectors ought to have the same shells in different specimens both rough and polished: the naturalist would thus, besides knowing the outside of the shell, be better acquainted with its internal characters, and the lady would have a pleasure in comparing the beauties of the shell, in its wrought state, to its natural coarse appearance. When a shell is to be polished, first examine whether it have naturally a smooth surface, or be covered with tubercles or prominences. A shell which has a smooth surface, and a natural dull polish, need only be rubbed with the hand, or with a piece of chamoy leather, with some tripoli, or fine rotten-stone, and it will become of a perfectly bright and fine polish. Emery is not to be used, because it wears away too much of the shell. This operation requires an experienced person, who knows where he is to stop; for in many of these shells the lines are only on the surface, and their beauty is easily defaced. A shell that is rough, foul, and crusty, or covered with a tartareous coat, must be left a whole day steeping in hot water; when it has imbibed a large quantity of this, it is to be rubbed with rough emery on a stick, or with the blade of a knife, to get off the coat. After this, it may be dipped in diluted aquafortis, spirit of salt, or any other acid: and, after remaining a few moments in it, be again plunged into common water. After this it is to be well rubbed with linen cloths, impregnated with common soap; and, when thus made perfectly clean, it is to be polished with the fine emery and a hair-brush. If after this the shell, when dry, appears not to have so good a polish as was desired, it must be rubbed over with a solution of gum arabic, which will add greatly to its gloss. When a shell is covered with a thick and fatty epidermis, as is the case with several of the mussels and tellinæ; in this case aquafortis will do no service, as it will not touch the skin; then a rough brush and coarse emery are to be used; and, if this does not succeed, seal-skin, or, as the workmen call it, fish skin and pumice-stone are to be employed. When a shell has a thick crust, which will not give way to any of these means, the best way is to plunge it into strong aquafortis, till the stubborn crust is wholly eroded. The limpets, auris marina, the helmet-shells, and several other species of this kind, must have this sort of management: a long piece of wax must be provided, and one end of it made perfectly to cover the whole mouth of the shell; the other end will then serve as a handle, and, the mouth being stopped by the wax, the liquor cannot get in to the inside to spoil it; then there must be placed on a table a vessel full of aquafortis, and another full of common water. The shell is to be plunged into the aquafortis; and, after remaining a few minutes in it, is to be taken out, and plunged into the common water.

The progress the aquafortis makes in eroding the surface is thus to be carefully observed; the point of the shell, and any other tender parts, are to be covered with wax, to prevent the aquafortis from eating them away; and, if there be any worm holes, they also may be stopped up with wax, otherwise the aquafortis would soon eat through in those places. When the coat is sufficiently eaten away, the shell is to be wrought carefully with fine emery and a brush; and, when it is thus polished as high as can be, it must be wiped clean, and rubbed over with gum water or the white of an egg. In this sort of work the operator must take care lest the aquafortis burn his fingers, or eat off the skin and the nails. These are the methods to be used with shells which require but a moderate quantity of the surface to be taken off; but there are others which require to have a larger quantity taken off, and to be uncovered deeper; this is called entirely scaling a shell. This is done by means of a horizontal wheel of lead or tin, impregnated with rough emery; and the shell is wrought down in the same manner in which stones are wrought by the lapidary, whom it will be proper to consult on such occasions. After the shell is cut down to a proper degree, it is to be polished with fine emery, tripoli, or rotten-stone, with a wooden wheel turned by the same machine as the leaden one. When a shell is full of tubercles, or protuberances, which must be preserved, it is then impossible to use the wheel; and, if the common way of dipping into aquafortis be attempted, the tubercles, being harder than the rest of the shell, will be eaten through before the rest is sufficiently scaled, and the shell will be spoiled. In this case a camel's hair pencil must be dipped in aquafortis; and with this the intermediate parts of the shell must be wetted, leaving the protuberances dry: this is to be often repeated; and the shell always to be plunged into water to stop the erosion of the acid, which would otherwise eat too deep. It is then to be polished with emery of the finest kind, or with tripoli, or the common polishing-stone used by the goldsmiths. The Dutch are very fond of shells, and are very nice in working them, but use the most violent methods, so as often to destroy all their beauty. They file them down on all sides, and often take them to the wheel, which destroys the very characters of the species. They even add some lines and colors with a pencil, afterwards covering them with varnish, so that they seem the natural lineations of the shell; the Dutch cabinets are by these means made very beautiful, but rendered totally useless as instructors in natural history. Connoisseurs are often imposed upon by these tricks to purchase them for new species.

Mother-of-pearl shells are composed of alternate layers of carbonate of lime and a thin membranaceous substance, which resembles exactly coagulated albumen in its properties. This membrane still retains the figure of the shell, after all the carbonate of lime has been separated by acid. Mother-of-pearl contains sixty-six carbonate of lime, and thirty-four membrane.

Various are the means used by artists to brighten the colors, and add to the beauty of

shells: and the changes produced by polishing in this manner are so great that the shell can scarcely be known afterwards to be the same it was; and hence we hear of new shells in the cabinets of collectors, which have no real existence as separate species, but are disguised by polishing. To caution the reader against impositions of this kind, it is proper to mention the most remarkable species thus usually altered. The onyx shell or volute, called the purple or violet tip, which in its natural state is of a simple pale brown, when wrought slightly, or polished with just the superficies taken off, is of a fine bright yellow; and, when eaten away deeper, it appears of a fine milk-white, with the lower part bluish; it is in this state that it is called the onyx-shell; and it is preserved in many cabinets in its rough state, and in its yellow appearance, as different species of shells. The violet shell is a species of porcelain or common covey, which does not appear in that elegance till it has been polished; and the auris marina appears in different forms, as it is more or less deeply wrought. In its rough state it is dusky and coarse, of a pale brown on the outside, and pearly within; when it is eaten down, a little way below the surface, it shows variegations of black and green: and, when farther eroded, it appears of a fine pearly hue within and without. The nautilus, when polished down, appears all over of a fine pearly color; but, when it is eaten away but to a small depth, it appears of a fine yellowish color, with dusky hairs. The burgau, when entirely cleared of its coat, is of the most beautiful pearl color; but, when only slightly eroded, it appears of a variegated mixture of green and red, whence it has been called the paroquet shell. The common helmet shell, when wrought, is of the color of the finest agate; and the mussels, in general, though very plain shells in their common appearance, become very beautiful when polished, and show large veins of the most elegant colors. The Persian shell, in its natural state, is all over white, and covered with tubercles; but when ground down on a wheel, and polished, it appears of a gray color, with spots and veins of a very bright and highly polished white. The limpets, in general, become very different when polished, most of them showing very elegant colors; among these the tortoise shell limpet is the principal; it does not appear at all of that color or transparency till it has been wrought. That elegant species of shell called the junquill-chama, which has deceived so many judges of these things into an opinion of its being a new species, is only a white chama with a reticulated surface; but, when this is polished, it loses at once its reticular work and its color, and becomes perfectly smooth, and of a fine bright yellow. The violet colored chama of New England, when worked down and polished, is of a fine milk-white, with a great number of blue veins, disposed like the variegations in agates. The asses ear shell, when polished after working it down with the file, becomes extremely glossy, and obtains a fine rose color all about the mouth. These are some of the most frequent important changes wrought on shells by polishing; and many of the very greatest beauties of this part of the

creation must have been for ever hid, but for this method of searching deep in the substance of the shell for them.

Marine shells may be divided, according to Mr. Hatchett, into two kinds; those that have a porcellaneous aspect with an enamelled surface, and when broken are often in a slight degree of a fibrous texture; and those that have generally, if not always, a strong epidermis, under which is the shell, principally or entirely composed of the substance called nacre, or mother-of-pearl. The porcellaneous shells appear to consist of carbonate of lime, cemented by a very small portion of animal gluten. This animal gluten is more abundant in some, however, as in the patellæ. The mother-of-pearl shells are composed of the same substances. They differ, however, in their structure, which is lamellar, the gluten forming their membranes, regularly alternating with strata of carbonate of lime. In these two the gluten is much more abundant.

Mr. Hatchett made a few experiments on land shells also, which did not exhibit any differences. But the shells of the crustaceous animals he found to contain more or less phosphate of lime, though not equal in quantity to the carbonate, and hence approaching to the nature of bone. Linnæus, therefore, he observes, was right in considering the covering of the echini as crustaceous, for it contains phosphate of lime. In the covering of some of the species of asterias, too, a little phosphate of lime occurs; but in that of others there is none.

Fossil and live shells of the same species differ, according to locality, distance, &c.—It has been remarked that the same fossil shells, found in places at a distance from each other, always exhibit some differences in their form, the deepness of their grooves, the degree of projection of their spines, &c. Mr. Basterodt affirms the same to be the case with living species, as he found that they do not exhibit the same characters in places separated at considerable distances from each other, or even in near localities, when the heat, humidity, nourishment, &c., are different. Hitherto but little attention has been paid to those local differences; hence it has happened that new species have been proposed, which were only varieties of known species. This fact is of great importance in a geognostical point of view.

The above writer seems also to have established that the same fossil species of shells are associated with different suites of species in different localities. The same species of fossil shell may occur in deposits situated at considerable distances from each other, but in these different localities the species are not grouped with the same set of species. It is also a matter of observation that fossil shells of the same species are more and more numerous in different basins of the same era of formation, the nearer these basins are to each other. In illustration of this latter fact, Basterodt informs us, that, of the 270 species which he found in the vicinity of Bourdeaux, but eighty-two occur in the dépôts of Italy, fifty-two around Paris, twenty-one in the tertiary basins of England, and only seventeen in the basin of Vienna in Austria.

SHELL, the outward part of a tent or marquée.

SHELL, a short jacket without arms, which was worn by light dragoons, and in some instances by the infantry, before the new regulations took place respecting the clothing of the British army. At the commencement of the late wars, some militia colonels derived no inconsiderable emolument from this mode of dress.

SHELL, LOADED, an invention for preserving the lives of people in danger of shipwreck.

SHELL OF A SWORD (plaque d'épée, Fr.), a particular part of a sword, which serves as a shield to the hand when it grasps the hilt. The regulation sword, which is directed to be worn in a cross belt, has its shell so constructed that one side can fall down, by which means the hilt hangs more conveniently.

A spring-shell of a sword (plaque d'épée à ressort, Fr.), a shell which by means of a spring can lie flat against the hip, when the sword is worn in a cross-belt. The proper word is coquille, not plaque.

SHELLS, in gunnery, are hollow iron balls to throw out of mortars or howitzers, with a fuse hole of about an inch diameter, to load them with powder, and to receive the fuse. The bottom, or part opposite to the fuse, is made thicker than the rest, that the fuse may fall uppermost. But in small elevations this does not always happen, nor indeed is it necessary; for, let the shell fall as it will, the fuse sets fire to the powder within, which bursts the shell, and causes great devastation. The shells had much better be of an equal thickness, for then they burst into more pieces. Mortars are thought to have been full as ancient as cannon. They were employed in the wars of Italy, to throw balls of red hot iron, stones, &c., long before the invention of shells. These last are thought to be of German invention, and the use of them in war to have been taught by the following accident:—A citizen of Venlo, at a festival celebrated in honor of the duke of Cleves, threw a number of shells, one of which fell on a house and set fire to it, by which misfortune the greatest part of the town was reduced to ashes. The first account of shells used for military purposes is in 1435, when Naples was besieged by Charles VIII. Shells were thrown out of mortars at the siege of Wachten-donk, in Guelderland, in 1588, by the earl of Mansfield. Mr. Malter, an English engineer, first taught the French the art of throwing shells, which they practised at the siege of Motte, in 1634. The method of throwing red hot balls out of mortars was first practised at the siege of Stralsund, in 1675, by the elector of Brandenburg; though some say in 1653, at the siege of Bremen. See **MORTAR**.

To find the weight of a shell. Rule.—Double the difference of the cubes of the diameters of the shell and hollow sphere, and seven times the result gives the weight in pounds, cutting off the two right hand figures of whole numbers. *Example.*—Let the diameter of the shell be 13 inches, and that of the hollow sphere 9.5. Then the cube of 13 is 2197, and that of 9.5, is 857.357; the difference is 1339.625; its double is 2679.25, which, multiplied by 7, gives 18754.625,

and cutting off two places, in whole numbers, the result is 187 lbs., or 1 cwt. 2 qrs. 21 lbs., the weight of the shell.

SHELLS, SHRAPNEL, or SPHERICAL CASE-SHOT, are shells of a peculiar construction, invented by colonel Shrapnel of the royal artillery. They were used with peculiar effect against the French army, which Sir Arthur Wellesley, now duke of Wellington, fought on the 21st of August, 1808; and also at the battle of Waterloo in 1815. The following explanation of the effects and advantages that might be derived by firing this species of shot is extracted from a book lately published:—

1. The whole charge takes effect on the enemy at any distance. By the present mode of firing the greatest part of the charge disperses as soon as it leaves the muzzle of the gun, and cannot be directed.

2. Grape, or case shot, may be fired with an effect equally close and collected, to any distance within the range of the piece; and the artillery need not advance within musket shot of the enemy to make use of this kind of fire with its full effect, and are not so subject to have their guns charged either by cavalry or infantry.

3. It requires less precision and exactness to point a piece of ordnance charged with spherical case shot than with round shot, because case shot is a wide and dispersed fire, and the difficulty in elevation consequently less.

4. Its comparative destruction with that of round shot will be, generally, as the number of shot within the shells to one; that is to say, a three pounder, twenty-two to one in its favor; a six pounder, fifty to one, &c., in which calculation is not enumerated any effect from the splinters of the shell.

5. Small balls cannot be projected to very considerable distances, unless enclosed in heavy spherical cases, which, from their form and weight, are not much influenced by the resistance of the air, or diverted from their direction.

6. The explosion of the shell makes no change in the direction of the shot within it: they consequently complete the shell's track, or curve, which has sometimes been observed to be 400 yards.

7. From the unevenness of the ground, such as hillocks, banks, fallow-fields, &c., all shot which graze most commonly lodge; whereas, by using this shell, the whole charge will be carried over these irregularities, and reach the object with its full contents of balls.

N. B. Firing this kind of shells from guns is managed with more facility than the ordinary howitzer practice both as to the length of fuse, as well as the elevation required, and may be carried on in the field precisely the same as firing round shot.

Mode of examining the different natures of lieutenant colonel Shrapnel's shells in the royal laboratory.—1. The shells are to be well examined with a pick hammer of a proper weight to the diameter of each nature, to find they are not damaged by sand holes, or other flaws.

2. They are to be well scraped inside, with scrapers that will get under the dip of the fuse hole, so that all the bore, sand, or gravel may be

cleaned out, which is done by rolling and shaking the shell with the fuse-hole downwards. It may be taken out of large shells with a proper ladle, that will go into the fuse-hole.

3. They are to be proved with a strong bellows and water as usual; the shot being placed under in a tub or bucket, introduce the nose of the bellows into the fuse, and by blowing them the water will bubble if the shell be porous.

4. They are to be examined, by the new calliper instruments, round the side and at the bottom, to ascertain their thickness and concentricity.

5. They are to be examined by a circular gauge, and appropriated to the respective ordinance they are found to answer. If any are too high by 0·3 of an inch, or too low by 0·3 of an inch, they are to be rejected.

6. When each shell is ascertained to be perfectly dry inside, it is to be placed with its fuse-hole up, and the nose of a strong bellows, forming an angle downwards, being introduced into it, a few blasts being given, will blow the remaining particles of dust out of the shell.

7. The shells are to be classed, by their fuse-holes, into different numbers, viz. 1, 2, 3, and 4; those of an equal size to be packed in boxes by themselves.

8. A file to be used occasionally to try if the metal is soft, instead of breaking the shell.

9. Each shell to be sounded, by striking it gently, as the ringing tone will be lost should there be an imperceptible crack in it.

N. B. In the examination of spherical case shot shells, the thick side of the shell need not be taken into consideration, but the thinnest part only; for when the thinnest part is too thin, by the rule given, the thickest part must be too thick, which needs no examination to discover.

Supposing an eighteen-pounder shell ought to be five inches thick in every part, subtract the non-concentricity allowed of 0·83 from it, and there remains 4·17 inches, for the thinnest part of an eighteen-pounder shell which can be received.

Method of making fuses of colonel Shrapnell's construction.—The fuses, after being turned so as to fit the fuse-holes, are bored, and a deep thread grooved inside, to hold the composition firm; and, instead of being turned with cups, they are hollowed conical, and roughed with a tool that cuts under, the better to receive the priming. After they are driven, with fuse composition, one and one-half inch, the yare sawed across the top, about one-fifth of an inch down, so as not to touch the composition, and divided into five equal parts, of two-tenths of an inch each; after which a bit of quick match is placed across, and drawn tight in the same grooves; they are then primed, with mealed powder and spirits of wine, capped and packed for service.

TABLE OF the DIMENSIONS and WEIGHT of SHELLS for MORTARS and HOWITZERS.

Species.	Weight.	Diameter.	Powder contained in Shells.	Powder for bursting.	Diameter of Fuse holes.		Thickness of Metal.
					Outside	Inside.	
13-Inch.	Cwt. qrs. lbs. oz.	Inch.	lbs. oz.	lbs. oz.	Inch.	Inch.	Inch.

DIMENSIONS of SHELLS for GUNS and CARRONADES made with an equal thickness of metal.

Species.		42-pr.	32.	24.	18.	12.
		Inch.	Inch.	Inch.	Inch.	Inch.
Guns.	Diameter of Exterior	6·684	6·105	5·547	5·05	4·4
	the Shell Interior	4·404	4·005	3·767	3·4	2·8
	Thickness of Metal	1·14	1·05	0·89	0·82	0·8
	Diameter of Exterior	0·894	0·894	0·893	0·832	0·832
	Fuse-hole Interior	0·826	0·826	0·826	0·76	0·769
Powder for bursting . .		14 oz.	11 oz.	12 oz.	9 oz.	5½ oz.
Carro- nades.	Diameter of Exterior	6·64	6·05	5·48	4·935	4·295
	the shell Interior	4·36	3·95	3·48	3·235	2·695
	Thickness of Metal . .	1·14	1·35	1·	0·85	0·98
	Shell's weight . . . lbs.		0·22		0·12	
	Contains powder . oz.		0·12½		00·9	
Powder for bursting oz.			0·10		00·7	

The following snells may also be fired from guns :—

Hand-grenades, from 6-pounders.

4½-shells . . . 12 . . .

5½-shells . . . 24 . . .

8-inch . . . 68-pr. carronades.

Shells may likewise be thrown from guns to short distances, in cases of necessity, though the bore be not of a diameter sufficient to admit the shell. For this purpose the gun may be elevated to any degree that will retain the shell upon its muzzle, which may be assisted by a small line going from the lugs of the shell round the neck of the gun. To produce a greater effect, the space between the shell and the charge may be filled with wads or other substances.

To SHELL, among horses, to have the teeth completely bare and uncovered, which happens about the fifteenth or sixteenth year.

SHELLS, MESSAGE, are nothing more than howitz shells, in the inside of which a letter or other paper is put; the fuse hole is stopped up with wood or cork, and the shells are fired out of a royal or howitz, either into a garrison or camp. It is supposed that the person to whom the letter is sent knows the time, and accordingly appoints a guard to look out for its arrival.

SHELL-FISH are in general oviparous, very few instances having been found of such as are viviparous. Among the oviparous kinds anatomists have found that some species are of different sexes in the different individuals of the same species; but others are hermaphrodites, every one being in itself both male and female. In both cases their increase is very numerous, and scarcely inferior to that of plants, or of the most fruitful of the insect class. The eggs are very small, and are hung together in a sort of clusters by means of a glutinous humor which is always placed about them, and is of the nature of the jelly of frog's spawn. By means of this they are not only kept together in the parcel, but the whole cluster is fastened to the rocks, shells, or other solid substances; and thus they are preserved from being driven on shore by the waves, and left where they cannot succeed. See TESTACEA.

SHELL-GALL-INSECT, a gall-insect, somewhat resembling those which are called the boat-fashioned ones, but differing in this, that as the two ends of that species are not very different in form, in this kind one of the ends is sharp and pointed in comparison with the other. It has its name of shell-insect from the resemblance it has to a mussel shell; as it is, in its whole form, not unlike one of the two shells in which the common sea-mussel is enclosed, but the pointed end of this insect is much more extended in length than the smaller end of this shell.

This species is extremely small, and may be easily mistaken for the minute case out of which some small insect has escaped; or, in an other state, for the nest of which some small insect has deposited its eggs; but, if the assistance of the microscope be called in, they will easily be discovered to be true gall-insects, even as soon as they are hatched from their eggs. This species, at its full growth, is so small that it requires good eyes to discover it: it is brown, very

smooth, and polished on the surface, and much of the color of the bark of some trees; it has usually an edge of a cottony matter, visible where its sides touch the tree, and its eggs are always deposited on a fine cottony bed; the young ones are white, flat, and have two small horns and six legs; in this state they are known to be of the gall-insect class, not by their likeness to their parent, but to the young gall-insects of other species. They march about very briskly for some time after they are hatched, and after that fix themselves, and then begin to grow, and by degrees alter their form, till they at length are of the same shape with their parent.—Reaumur, Hist. Ins. tom iv. p. 69, 70.

SHELL-TOOTHED HORSE is one that from four years, to old age, naturally bears a mark in all his fore-teeth, and there still keeps that hollow place with a black mark, which we call the eye of a bean, insomuch, that at twelve or fifteen he appears with the mark of a horse that is not yet six.

SHELLA, an ancient town of Africa, in Morocco; containing several Moorish tombs, which are highly venerated. The town is considered as an asylum so sacred that none but Mahometans are permitted to enter it. It is supposed to have been anciently the metropolis of the Carthaginian colonies on the west coast of Africa.

SHELLIF, the most considerable river of Algiers, the Chinalaph of the ancient geography. It rises among the mountains of Atlas, in a place called the Seventy Mountains; flows north during the first part of its course, then west, and then nearly parallel to the sea. Its whole length is about 200 miles. In its early course it forms the lake of Titterie.

SHELTER, *n. s.*, *v. a. & v. n.* } Skinner deduces it from
SHELTERLESS, *adj.* } shell; Davis from Sax. *scylb*, a shield. There is also a Goth. *skul*, and Isl. *skildu*. Protection; cover from outward violence or inclemency; a defender or protector; state of being covered: to cover in this way; defend: to take or give protection of this kind: shelterless is, defenceless: without home or refuge.

Thou hast been a *shelter* for me, and a strong tower from the enemy. *Psalm lxi. 3.*

We hear this fearful tempest sing,

Yet seek no *shelter* to avoid the storm.

Shakspeare. Richard II.

They *sheltered* themselves under a rock. *Abbot.*

Low at his foot a spacious plain is placed,
Between the mountain and the stream embraced;
Which shade and *shelter* from the hill derives,
While the kind river wealth and beauty gives.

Denham.

They wish the mountains now might be again
Thrown on them, as a *shelter* from his ire. *Milton.*
We besought the deep to *shelter* us. *Id.*

Heroes of old, when wounded, *shelter* sought;
But he, who meets all dangers with disdain,
Even in their face his ship to anchor brought,
And steeply high stood prompt upon the main.

Dryden.

Those ruins *sheltered* once his sacred head,
When he from Worcester's fatal battle fled,
Watched by the genius of this royal place. *Id.*
Now sad and *shelterless*, perhaps, she lies,
Where piercing winds blow sharp.

Rowe's Jane Shore

In vain I strove to check my growing flame,
Or *shelter* passion under friendship's name ;
You saw my heart. *Prior.*

Comfort thyself with such thoughts, chiefly when
all earthly comforts fail thee ; then do thou particu-
larly retreat to those considerations, and *shelter* thy-
self under them. *Atterbury.*

The healing plant shall aid,
From storms a *shelter*, and from heat a shade. *Pope.*

Then seeks the farthest ooze, the *sheltering* weed,
The caverned bank, his old secure abode. *Thomson.*

Who into *shelter* takes their tender bloom,
And forms their minds to fly from ills to come. *Young.*

November hirlples o'er the lea,
Chill, on thy lovely form ;
And gane, alas ! the *sheltering* tree,
Should shield thee frae a storm. *Burns.*

At a thoughtless age, allured
By every gilded folly, we renounced
His *sheltering* side, and wilfully forewent
That converse, which we now in vain regret. *Cowper.*

SIEM, or **SEM**, the second son of Noah, born about A. M. 1558. His filial piety and modesty in endeavouring, along with his elder brother Japhet, to conceal the effects of the only act of folly which the excellent old patriarch had fallen into, and which their brother Ham, with probably his son Canaan, had made a subject of ridicule, are recorded in Genesis ix. 23, together with the remarkable benediction pronounced upon them in consequence, and the dreadful curse upon Ham's posterity, the effects of which continue even to the present period. The posterity of Shem by his five sons Elam, Ashur, Arphaxad, Lud, and Aram, peopled most of the south part of Asia and the adjacent islands, and gave rise to the kingdoms of Persia, Assyria, Phœnicia, Lydia, Syria, &c. See **PHILOLOGY**. In that branch of it from which the Hebrews descended, from Heber, the grandson of Arphaxad, the true church, and the knowledge of the true God were continued for above 2000 years, till the coming of Jesus Christ, by the promulgation of whose glorious gospel among the Gentiles the prophecy respecting the posterity of Japhet was completely fulfilled. Shem lived to the age of 600 years, and died about A. A. C. 2467.

SHEMAIAH, an inspired prophet of Judah, in the reign of Rehoboam, who prevented a civil war between Israel and Judah, and prevailed on Rehoboam's new raised army of 180,000 warriors to disband, by assuring them, that the division of the kingdom which had just taken place was ordained by the Almighty. See 1 Kings xii. 21—24. He delivered other two messages to the king and the people. Shemaiah was also an author, and wrote the history of Rehoboam ; which is quoted in 2 Chron. xii. 5, 7, and 15.

SIEMINITH, in Hebrew antiquity, a musical instrument of eight strings. It is mentioned in the title of Psalms vi. and xii.

SHENAN, a drug used in the east for dyeing leather red. It is the eastern jointed kali, a species of salicornia, which grows plentifully in Turkey, Syria, Africa, &c. The salicornia perennis has been used for it, but not always with success.

SHENANDOAH, a county of Virginia, United States, bounded north by Frederick county south-east by Culpeper and Maddison counties south-west by Rockingham county, and west by Hardy county. Chief town Woodstock.

SHENANDOAH, a river of Virginia, United States, which rises in Augusta county, and, after a course of about 200 miles, joins the Potomac, in lat. 38° 4' N., just before the latter bursts through the Blue Ridge. It is composed of the South, Middle, and North rivers, and is navigable for boats 100 miles.

SHENID, *v. a.* *Preter.* and *part. pass.* shent. Sax. *scendan* ; Belg. *schenden*. To ruin ; spoil ; mischief. Obsolete.

Provide for thy wife, or else look to be *shent*,
Good milchcow for winter, another for Lent. *Tusser.*

Shepherds, should it not *shent*
Your roundels fresh, to hear a doleful verse
Of Rosalind, that Colin made ? *Spenser.*
She passed the rest as Cynthia doth *shend*
The lesser stars. *Id.*

Sore bruised with the fall, he slow uprose,
And, all enraged, thus him loudly *shent* :
Disleal knight ! whose coward courage chose
To wreck itself on beast. *Faerie Queene.*

My tongue and soul in this be hypocrites ;
How in my words soever she be *shent*,
To give them seals never, my soul, consent. *Shakspeare. Hamlet.*

Such a dream I had of dire portent,
That much I fear my body will be *shent* ;
It bodes I shall have wars. *Dryden.*

SHENSTONE (William), an admired English poet, the eldest son of a country gentleman, who farmed his own estate in Shropshire, was born in November 1714. He learned to read of an old dame, whom his poem of the School Mistress has immortalised ; and soon received such delight from books that he always expected, when any of the family went to market, a new book should be brought him. As he grew older he went to the grammar school in Hales Owen, and afterwards to Mr. Crumpton, an eminent schoolmaster at Solihul, where he distinguished himself by his quick progress. In his tenth year (June 1724) he was deprived of his father ; and soon after (August 1726) of his grandfather ; and was with his brother, who died afterwards unmarried, left to the care of his grandmother, who managed the estate. From school he was sent, in 1732, to Pembroke College in Oxford, a society which, for half a century, has been eminent for English poetry and elegant literature. Here he continued his name ten years, though he took no degree. After the fourth year he put on the civilian's gown, but without any intention to engage in the profession. About the time he went to Oxford the death of his grandmother devolved his affairs to the care of the Rev. Mr. Dolman, of Brome, in Staffordshire, whom he always mentioned with gratitude. At Oxford he, in 1737, published a small Miscellany, without his name. He published, in 1740, his *Judgment of Hercules*, addressed to Mr. Lyttleton, whose interest he supported with great warmth at an election ; this was two years afterwards followed by the School Mistress. Mr. Dolman died in 1745, and the care of his fortune now fell upon himself. He

then took the whole estate into his own hands, and rather improved its beauty than increased its produce. Now began his delight in rural pleasures, and his passion for rural elegance; but in time his expenses occasioned clamors that overpowered the lamb's bleat and the linnet's song, and his groves were haunted by beings very different from fawns and fairies. He spent his estate in adorning it, and his death was probably hastened by his anxieties. He was a lamp that spent its oil in blazing. He died at the Leasows of a putrid fever, February 11th, 1763; and was buried by the side of his brother, in the church-yard of Hales-Owen. In his private opinions our author adhered to no particular sect, and hated all religious disputes. Tenderness, in every sense of the word, was his peculiar characteristic; and his friends, domestics, and poor neighbours, daily experienced the effects of his benevolence. This virtue he carried to an excess that seemed to border upon weakness; yet if any of his friends treated him ungenerously he was not easily reconciled. On such occasions he used to say, 'I never will be a revengeful enemy; but it is not in my nature to be half a friend.' He was no economist; for the generosity of his temper prevented his paying a proper regard to the use of money; he exceeded, therefore, the bounds of his parental fortune. But, if we consider the perfect paradise into which he had converted his estate, the hospitality with which he lived, his charities to the indigent, and all out of an estate that did not exceed £300 a year, one should rather wonder that he left any thing behind him than blame his want of economy; he yet left more than sufficient to pay all his debts; and by his will appropriated his whole estate to that purpose. Though he had a high opinion of many of the fair sex, he forbore to marry. A passion he entertained in his youth was with difficulty surmounted. The lady was the subject of that admirable pastoral, in four parts, which has been so universally and so justly admired, and which, one would have thought, must have softened the proudest and most obdurate heart. Another of his poems does no less honor to his feelings and his virtuous sentiments. It displays, in the most affecting terms, the grief and remorse of an ingenuous mind upon the unfortunate issue of a licentious amour, and is founded on fact. This beautiful poem, falling into the hands of a young gentleman at the critical period of a similar connexion, had the effect of preventing a similar fatal catastrophe to that of Henry and Jessy, described by our poet, by determining him to marry the object of his affection. Mr. Shenstone's works have been published by Mr. Dodsley, in 3 vols., 8vo. The first volume contains his poetical works, which are particularly distinguished by an amiable elegance and beautiful simplicity; the second contains his prose works; the third his letters, &c.

SHEPHERD. In the General Treatise on Cattle, it is remarked that the method of encouragement adopted in some districts, of allowing the shepherd to possess a small flock, or as many ewes as his means will allow, is probably one of the most powerful. It gives him that steadiness appertaining to property, and is an additional

and strong incentive to the attainment of knowledge in his business. A shepherd should be naturally active, both in body and mind, clear-headed and clear-sighted; such a one, for instance, as can distinguish the individual countenances of a numerous flock, and, running over them with his bodily and mental eye, instantly give the exact number and condition; or perceive, at a glance, a bird's nest in the thickest quickset. Fond of animals and attractive to them, the latter quality of which is well known to inhere in some persons; possessing a musical voice and shrill whistle; hardy, patient, watchful; satisfied with little sleep, and temperate in drink. It is conceived that he ought never to be suffered, if he profess, to practise physic, nor any but the most easy and common operations, a farce that too often ends in a tragedy; for, if of two evils we ought to choose the least, the office of medical practice had better devolve on the master. And for his comfort in the severe weather, in some situations, the moveable wooden house on wheels may be of use. Also that he ought to be clad during winter with substantial woollen next his skin, from his feet upwards, as the best defence against those rheumatic ails, to which he must be necessarily subject; and he should always go provided with the instruments proper to his profession, ready for immediate occasions, namely, scissors, knife, steel, fleam, salve-box, &c. And in folding, as the shepherd will have the flock perpetually under his eye, the first writer thinks, he will be capable of judging with certainty and precision respecting the state of every individual, so that the earliest remedy may be applied to every disorder, and such sheep may be turned out of the fold as are found not to be able to go through their work without manifest injury in their health; and, if a sheep or lamb be seized with a dangerous and incurable malady, to kill and dress it immediately; for it is one part of the business of a shepherd to be so far skilled in the butcher's trade as to be able to slaughter, flea, and dress a sheep on occasion. Farther, that a good shepherd will be careful that his flock be driven late to fold in an evening, and released early in the morning from their confinement, in order that they may enjoy the coolest parts of the day on the food. He will be cautious that they are allowed a sufficient time to graze in the uplands previous to their being driven into the fold, that they may retire to rest with full bellies, by which the quantity of the dung and urine will be considerably augmented. He will likewise be careful in reviewing the hurdles, and providing that these are fixed in the ground, lest by any accident they should be thrown down during the night, and the flock by these means get into mischief, or intermix with other sheep; he will count his sheep regularly every evening when he drives them to the fold, and take a fresh tale in the morning, when he turns them on their feed; he will, previous to dismissing them from the fold, worry them gently round the same, in order to cause them to dung and stale plentifully, that the manure may be left in the field, otherwise the greatest part of the trundles will be dropt on the road, or carried on to the marsh, where, lying

thin, this dressing can do but little service, and where in truth it is not wanted; he will bestow a particular attention on every individual in his flock, and, for those which show any appearance of being stung by the fly, he will be prepared with a pair of shears to clip away the wool from the part, and, having taken out the maggots, will anoint the place with a mixture of train oil and brimstone; but, if slightly attacked, he will destroy the maggots by strewing on them powder of white lead; and if any of the flock should haply break with the scab, a disorder to which folding sheep are continually subject, and which seldom fails to show itself in the spring and fall, he will be provided with a proper remedy to keep it under, and prevent the contagion from spreading. It is thought that one shepherd will be able to look after 300 sheep.

In respect to the necessity of a dog, as an assistant to the shepherd, Mr. Lawrence thinks that it has of late very rationally become a question among the most intelligent sheep-masters: it may be thus settled: there can be no occasion for such aid, nor any necessity for incurring the danger of it, amidst convenient enclosures, or where quiet breeds of sheep are kept, and where it is made an object to render them tame and docile: and if, upon extensive wastes and mountain districts, the service of dogs cannot well be dispensed with, it ought to be made a main point that they be trained early to a kindness for the sheep, and to view them rather as their companions than their prey; a thing which he knows by experience to be most easy.

THE SHEPHERDS, SHEPHERD KINGS, or ROYAL SHEPHERDS, OF EGYPT, in ancient history, is a denomination given to a class of inhabitants of a part of Egypt, concerning whose origin, abode, and migration, both ancient and modern writers have entertained very different opinions. The learned Bryant has published an elaborate Dissertation on this subject. Differing from others concerning the situation of the land of Goshen, he conceives it to have been the Nome called the Arabian, from the Arabian shepherds who had formerly settled in those parts, and held them for many years, and denominated by the LXX, *Γεσσημ της Αραβιας*. The province of Arabia, says this author, was one of the three most remarkable nomes, the other two being those of Bubastus and Heliopolis. These three nomes were contiguous to each other, and towards the summit of Lower Egypt. The nome of Heliopolis, according to his statement, was a Mediterranean district; and consequently the two provinces, or that of Phacusa (i. e. the Arabian nome), and that of Bubastus, that are always mentioned with the former, were so likewise. Phacusa, mentioned by Strabo only as a village, was the province at whose summit the Nile was first divided, where stood the city of Cercasora. It was called the Arabian nome for the reason above-mentioned, and had for its metropolis Phacusa, and the places situated upon its borders were Babylon, Heliopolis, and Hieroum. From Syncellus we learn that Egypt had been in subjection to a three-fold race of kings, who are termed the Auritæ, the Mestrai, and the Egyptian. The Auritæ were the Arabian shepherds

and their kings, who reigned here a considerable time, maintaining themselves by force; till, after many struggles they were finally expelled by the natives.

According to Manetho, the whole body of this people bore the appellation of Huksos, that is, royal shepherds; the first syllable in the sacred dialect, signifying a king, and the latter, in the popular language, signifying a shepherd; and by a composition of these two was formed the word Huksos. These people are said to have been Arabians. Josephus further informs us, from Manetho, that the shepherds maintained themselves in Egypt 511 years. At last the people of Upper Egypt rose in opposition to them, and after some time expelled them the country. However, on their departure, they were afraid of going towards Assyria, and therefore resorted to the country called afterwards Judea, and built Jerusalem. We learn also, from the same authority, that another class of people sojourned in Egypt in the reign of Amenophis; and that they were treated as slaves by the prince of the country, because they were infected with the leprosy. As their number very much increased, he employed them in the stone quarries that lay on the east side of the Nile, in company with some of the Egyptians. Upon a remonstrance afterwards made to him, he granted them for a retreat the city of Abaris, where the former shepherds had resided, that now lay desolate. The people belonging to each of the two classes now mentioned were esteemed shepherds: the first shepherds were lords and conquerors; the others were servants, to whom was assigned the city which the former had evacuated. The latter were Israelites, as appears from the name of their leader and lawgiver, Moses; and the former were Arabians, who are said to have come from the east; and they are, without doubt, the Auritæ, who founded the city of Auris, or Abaris, which is no other than the city אור, Ur or Aur, signifying light and fire, of which element the Auritæ must have been worshippers, as all the Arabians were. Their chief god was Alorus (Al Orus), the god of fire. Accordingly the shepherds were called Auritæ, from the chief object of their worship, and their kings were styled priests of Alorus, or, according to the Greeks, priests of Vulcan. Hence it has been inferred that they came from Babylonia, a country that lay due east from Egypt, which country was the original seat of the genuine Arabians, and the true source whence their religion flowed. The two principal cities of that country were Ur or Aur, and Babylon: in memory of which they built two of the same name in Egypt. Wherever they resided they introduced the Tzeba-Schanain, or Zabian worship, together with the worship of fire. Hence we are informed by Herodotus that Vulcan was particularly honored at Heliopolis and Memphis, which places they are said to have built. The true name of these people, says Bryant, who were called by the Greeks and Romans Arabians, was Cushan or Cusæans, the same that they gave to the province where they settled. See CUSH. These strangers, therefore, who settled in Egypt, were no other than the Cusæans; and they have been styled Arabian shepherds, because all the primi-

tive Arabians were Normades or shepherds. These people, becoming lords of the country, undoubtedly chose that part which was the most eligible, and their profession would lead them to the best land for pasturage; in respect of which Goshen had not its equal. For it was part of the *πεδιον Αιγυπτου*, the rich champaign of Egypt; so that this circumstance among others would induce one to think that they settled here. This is confirmed by the worship which they settled in these parts; the cities they built; and the names which they bequeathed to the province. According to the Mosaic account, the land of Goshen is repeatedly said to be in the land of Egypt, 'in the best of the land;' and yet the LXX call it *Γεσσαρ της Αραβιας*, which could be owing to no other reason besides its being the land of Cushan (Goshen), which was interpreted Arabian; for in Arabia it was not situated. Hence it has been concluded that the place where the children of Israel resided in Egypt was the principal Arabian nome, at the extreme and highest part of Lower Egypt, called Cushan. This was the land to which the children of Israel succeeded, after it had been abandoned by its former inhabitants; but it is uncertain at what interval. It appears to have been an unoccupied district; and, as it was the best of the land, there is no accounting for its being unoccupied but by the secession of the Cusæans, whose property it had lately been. Accordingly Manetho expressly affirms that the second shepherds succeeded to the places which had been deserted by the former; and he moreover says, that the city Abaris, which had been built by the first shepherd king, was given to those of their body who were employed in the quarries.

Bryant suggests that the migration of the shepherds was about the time of Serug or Nahor: and this is the time when archbishop Usher supposes it to have happened, who refers it to the year A. M. 1920, according to the Hebrew computation, in the 101st year of the life of Serug, the seventh from Noah, and in the forty-second year of Terah, eighty-eight years before the birth of Abraham. Bishop Cumberland supposes that the shepherds invaded Egypt A. M. 1937, in the time of the same patriarchs, according to the Hebrew chronology. Our author has alleged several arguments to prove that the Arabian shepherds were distinct from the Israelites, and prior to them. When the Arabians came into Egypt, they are said to have been 240,000 in number, whereas the Israelites were but seventy persons. The former took possession by force; the latter were invited, and had a grant of all that they possessed. The one held the people in slavery; the others were themselves enslaved. The Arabians were driven out of the land; the Israelites were not suffered to depart. See Bryant's *Observations and Enquiries*, &c. Cont. 1767.

SHEPPEY, an island of Kent, situated at the mouth of the Thames and Medway, separated from the main land of the county by the Swale. It is about twenty-one miles in circumference; the principal places in it are Sheerness, Queenborough, and Eastchurch, Leysdown, and Minster parishes. Its name is supposed to be derived from the number of sheep formerly bred

here. It yields good corn, but is bare of wood, and the water is but indifferent, except at Sheerness, where wells sunk below the bottom of the sea produce excellent water.

SHEPPERTON, a parish of Spelthorne hundred, Middlesex, four miles S. S. E. from Staines, on the banks of the Thames, and eighteen from London. A detached part of this parish remains in Surrey, owing to the Thames having altered its course; and that river now passes over the foundation of its ancient church. Near the bridge over the river at Walton are Cowey-stakes, supposed to be the remains of those driven into the river by the Britons, to prevent Caesar's army from fording it; one of these is preserved in the British Museum. It is recorded that the learned Erasmus passed much of his time in the parsonage-house here with his preceptor the rector of the parish.

SHEPREVE (John), a learned English orientalist, born at Sugworth, near Abingdon, in Berkshire. He was fellow, and became Greek recorder of Corpus Christi College, Oxford; and in 1538 he was appointed professor of Hebrew in it. He had a very profound knowledge of the Hebrew Scriptures. He published many poems, and died at Agmondesham, in Bucks, in 1542.

SHEPTON-MALLEY, a market town and parish in Whitestone hundred, Somersetshire, five miles east of Wells, and 115½ from London. The inhabitants are largely employed in knitting stockings, and various other woollen manufactures. The town is situated on several small hills, and the streets irregularly built. There is no curious or remarkable public building except the market cross, erected in 1590 on five arches, and supported by pentagonal columns.

SHERARD (William), a learned botanist, was born in 1659, and educated at Merchant Tailor's School, and St. John's College Oxford. Appointed travelling tutor to lord Howland, son of the murdered lord Russel, he formed an acquaintance with all the learned botanists of the continent, and attended three courses of Tournefort's botanical lectures, in 1686, 87, and 88, at Paris. In the summer of 1688 he describes himself as having passed some time in Holland, collecting specimens of plants from the rich gardens of that country, and getting them named by professor Herman himself, who allowed him to peruse the manuscript rudiments of his *Paradisus Batavus*, to examine his herbarium, and to compose a *Prodromus* of that work. Sherard afterwards became the editor of Herman's book itself.

In 1700 Mr. Sherard communicated to the Royal Society a paper relative to the making of Chinese or Japan varnishes, which is printed in the *Philosophical Transactions*, v. 22. The information which it contains was sent by the Jesuits to the grand duke of Tuscany, and probably obtained by our author at Florence. He now became one of the commissioners for sick and wounded seamen at Portsmouth, and about the year 1702, or soon after, was sent out as British consul to Smyrna. Here his botanical taste met with fresh gratification. He visited the seven churches of Asia, copied several ancient inscriptions, and communicated to the Royal

Society an account of the new volcanic island, near Santorini, which rose out of the sea May 12th, 1707. Botany, however, continued to be his leading object. He had a villa at Sedekio near Smyrna, where he began his great herbarium. Hasselquist visited this spot, with the devotion of a pilgrim, in the spring of 1750. Whatever specimens Sherard could obtain from Greece, and the neighbouring countries, he here carefully preserved; and being well aware of the insufficiency of Bauhin's Pinax, as a clue to the botanical knowledge then in the world, he is said to have here formed the project of continuing it before he returned to his native country in 1718. Soon after his return he received at Oxford the degree of LL.D. In 1721 Dr. Sherard revisited the continent. Vaillant was now in a declining state of health, and died in May 1722. Previous to his decease he concluded, through the mediation of Sherard, the sale of his manuscripts and drawings of Parisian plants, to Boerhaave, who published in 1727 the splendid *Botanicon Parisiense*. This work is said to have owed much to the superintendence of Sherard, who passed a summer with Boerhaave in revising the manuscript. Our great botanist had already rendered a more important service to his favorite science by bringing with him from Germany, in August 1721, the celebrated Dillenius. By a comparison of dates, it appears that Sherard made several visits to the continent. He went from Paris to Holland in 1721, and thence with Dillenius, the same year, to England. He staid some time with Boerhaave again in 1724, or perhaps 1725. We know not precisely when it happened that he was, like Linnæus in Norway, in danger of being shot for a wolf, or a thief, by some rustic.

James Sherard, seven years younger than his brother, who had acquired opulence by medical practice in London, had a great fondness for the same pursuit, and reared at his country seat, at Eltham, a number of exotic plants. Hither the more learned subject of this article frequently resorted: and, having acquired affluence by his public appointments, he lent his aid to all who required it. He assisted Catesby with information and with money, to bring out his *Natural History of Carolina*, though neither that work, nor the *Hortus Elthamensis* of Dillenius, appeared till some time after his decease, which happened on the 12th of August, 1723, when he was sixty-nine years of age. His brother died February 12th, 1737, aged seventy-two, and is buried in Evington church, near Leicester. The most splendid service to botany, though it for a long time yielded little fruit, was rendered by the will of Dr. William Sherard, who left £3000 to found and support a botanical professorship at Oxford. He bequeathed to this establishment his choice botanical library, his ample herbarium, and the manuscript of his Pinax.

The herbarium of Sherard is considered, excepting that of Linnæus, the most ample and valuable botanical record in the world. In it may be seen original specimens from Tournefort, and all the writers of that day, named by themselves, accompanied by remarks, or by queries. He collected also copies of original drawings, from botanists whose specimens were

not to be had, such as Plumier. The most rare, and even unique, books are to be found in his library. All these collections are still in good preservation, though the noble stone building, originally constructed to receive them, was sacrificed a few years since that the adjoining street might be widened.

SHERARDIA, in botany, little field madder, a genus of the monogynia order, and tetrandria class of plants; natural order forty-seventh, stellate: *cal.* small, and quadridentate: *cor.* monopetalous, long, and funnel-shaped: *seeds* two, naked, and crowned with the calyx. There are three species, viz. 1. *arvensis*; 2. *fruticosa*; and, 3. *muralis*.

SHERBET, *n. s.* Arab. *sharbat*. The juice of lemons or oranges mixed with water and sugar.

They prefer our beer above all other drinks; and considering that water is with the rarest, especially in this climate, the dearest of *sherbets*, and plenty of barley, it would prove infinitely profitable to such as should bring in the use thereof. *Sundys.*

SHERBET, or **SHERBIT**, was first brought into England from Turkey and Persia, consisting of water, lemon-juice, and sugar, in which are dissolved perfumed cakes made of excellent Damascus fruit, containing an infusion of some drops of rose water. Another kind of it is made of violets, honey, juice of raisins, &c.

SHERBORNE, a market-town and parish in the hundred and division of Sherborne, Dorsetshire, seventeen miles north by west from Dorchester, and 116½ W.S.W. from London; pleasantly situate on the side of a hill near the border of the White-Hart Forest, and divided into two parts, by the river Ivel, called Sherborne and Castleton; that part called Castleton had a strong castle, of which only the ruins are now to be seen. The inhabitants are employed in various trades and manufactures, principally in those of woollen cloth, linen, and silk. Anciently it was a bishopric; but, in the eleventh century, the see being removed to Salisbury, the cathedral was converted into an abbey. This was originally a noble structure; but, at the dissolution of the monasteries, it was made parochial, and is now the finest parish church in the west of England. The inside, beautifully decorated, contains many Saxon monuments of kings and nobles. Near the church is a free-school, built and endowed by Edward VI., and an alms-house for sixteen men and eight women. In the town is a market-house, a workhouse, a dissenters' chapel, and several schools and benefit societies. The general quarter-sessions are held here. The mansion called Sherborne Castle is a beautiful structure, the seat of lord Digby. Near Sherborne is White-Hart Forest. **Market** on Saturday. **Fairs**, the day before Holy Thursday, 18th and 26th of July, and the first Monday in October, O.S.

SHERBRO, a country and river of Western Africa, at the northern extremity of the Grain or Pepper coast of Guinea. The river, with a large island at its mouth, is navigable twenty leagues up for ships of burden, and vessels of seventy or eighty tons may ascend 250 miles. The channel, however, is encumbered with rushes, and subject to frequent tornadoes. The country abounds in

grain, fruits, poultry, and a species of pearl oyster.

SHERD, *n. s.* Sax. *ſceapð*. A fragment of broken earthenware. See **SHARD**.

The trivet-table of a foot was lame;

She thrusts beneath the limping leg a *sherd*.

Dryden.

SHEREBATOF (Prince), a learned Russian nobleman, who published several works in the Russian language. Of these the principal is his *History of Russia from the earliest Times*; which is a faithful and well written work.

SHERIBON, or **CHERIBON**, a town in the island of Java, the capital of a district of the same name, and situated about 150 miles east from Batavia. The surrounding country is remarkably fertile, and produces the finest coffee raised on the island. Its other productions are timber, cotton, yarn, areca, indigo, sugar, and some pepper. The horses of this district are reckoned the best in Java, and in the contiguous woods and mountains the rhinoceros is sometimes discovered. The roadstead at Cheribon is open, and only sheltered to the west by a large sand-bank, with four and a half and five fathoms water, two leagues from the shore, at which distance ships of burden are obliged to anchor. Smaller vessels run along the bank to within three-fourths of a league from the land. In order to enter the river, country craft, drawing from four to six feet, are obliged to wait for the high tides on account of the small bank at the mouth. The appearance of this place resembles a large village more than a town. It is at present the capital of a principality, divided between two princes of the same family, each of whom takes the title of sultan, and resides in it; but the exterior of their palace exhibits little of Asiatic pomp and grandeur, being built of plank and bamboos. On the right bank of the river is a small brick fort surrounded by a ditch, over which is a bridge protected by a redoubt. This fortress is of little strength, its embrasure parapet being only eighteen inches thick, with only four small guns, kept more for the purpose of making signals than for defence. The mole and battery are in a state of the greatest decay, and the garrison only fifteen Maduran soldiers, commanded by a European serjeant and two corporals; the whole scarcely sufficient to resist the attacks of the roving Malay pirates who infest the adjacent seas. The European inhabitants of the town are the resident, secretary, book-keeper, serjeant-major, and three subalterns; the rest are natives, who compose two-thirds of the population, and Chinese, employed in the retail trade and agriculture. This state put itself under the protection of the Dutch East India Company in 1680, since which justice and injustice have been administered by the princes of the country in conjunction with the resident on the part of the company. These chiefs are under an obligation to deliver to the Dutch East India Company exclusively the produce of their respective territories at fixed prices.—Tombe, Stavovrinus, &c.

SHERIDAN (Thomas), D. D., the intimate friend of dean Swift, is said by Shield, in *Cibber's Lives of the Poets*, to have been born about 1684, in the county of Cavan, where his parents lived in no very elevated state. They are de-

scribed as being unable to afford their son the advantages of a liberal education; but he, being observed to give early indications of genius, attracted the notice of a friend to his family, who sent him to the college of Dublin, and contributed towards his support there. He afterwards entered into orders, and set up a school in Dublin, which long maintained a very high degree of reputation, as well for the attention bestowed on the morals of the scholars as for their proficiency in literature. So great was the estimation in which this seminary was held that it is asserted to have produced in some years the sum of £1000. It does not appear that he had any considerable preferment; but his intimacy with Swift, in 1725, procured for him a living in the south of Ireland worth about £150 a year, which he went to take possession of, and, by an act of inadvertence, destroyed all his future expectations of rising in the church; for being at Cork on the 1st of August, the anniversary of king George's accession, he preached a sermon on this text, 'Sufficient for the day is the evil thereof.' On this being known he was struck out of the list of chaplains to the lord lieutenant, and forbidden the castle. This living Dr. Sheridan afterwards changed for that of Dunboyne, which, by the knavery of the farmers and power of the gentlemen in the neighbourhood, fell so low as £80 per annum. He gave it up for the free school of Cavan, where he might have lived well in so cheap a country on £80 a year salary, besides his scholars; but the air being, as he said, too moist and unwholesome, and being disgusted with some persons who lived there, he sold the school for about £400; and, having soon spent the money, he fell into bad health, and died September 10th, 1738, in his fifty-fifth year. Lord Corke has given the following character of him: 'Dr. Sheridan was a school master, and in many instances perfectly well adapted for that station. He was deeply versed in the Greek and Roman languages, and in their customs and antiquities. He had that kind of good nature which absence of mind, indolence of body, and carelessness of fortune, produce; and, although not over strict in his own conduct, yet he took care of the morality of his scholars, whom he sent to the university remarkably well founded in all the kinds of classical learning, and not ill instructed in the social duties of life. He was slovenly, indigent, and cheerful. He knew books much better than men; and he knew the value of money least of all. In this situation, and with this disposition, Swift fastened upon him, as upon a prey with which he intended to regale himself, whenever his appetite should prompt him.' His lordship then mentions the event of the unlucky sermon, and adds, 'This ill-starred, good-natured, improvident man, returned to Dublin, unhinged from all favor at court, and even banished from the castle. But still he remained a punster, a quibbler, a fiddler, and a wit. Not a day passed without a rebus, an anagram, or a madrigal. His pen and his fiddlestick were in continual motion.' One of the volumes of Swift's miscellanies consists almost entirely of letters between him and the dean. He published a prose translation of Persius; to which he added the best notes of former editors, with many judicious ones

of his own. This work was printed at London, 1739, in 12mo.

SHERIDAN (Thomas), A. M., son of the doctor, and an eminent actor, philologist, and lexicographer, was born at Quilca, in Ireland, in 1721. In 1734 and 1735 he studied at Westminster; and, on his return to Ireland, attended Trinity College, Dublin, where he took his degree. On his father's death, he entered on the stage. His first appearance was at Dublin in 1743 in the character of Richard III., wherein he met with unbounded applause. In 1744 he came to London, and appeared in Hamlet at Covent Garden. In 1745 he engaged at Drury Lane, and performed Siffredi, in Tancred and Sigismunda. About this time a quarrel took place between Sheridan and Garrick, which was not made up when Sheridan left London. On his return to Dublin, he undertook the management of the Dublin theatre; and, finding that Mr. Garrick was then unemployed, he very politely invited him over, upon the most liberal terms, which Mr. Garrick accepted. But, though Miss Belamy and Mr. Barry often acted along with them, they were not able to exhibit plays oftener than twice a-week, and the receipts for the season did not exceed £3400. Mean time, in winter 1747, Mr. Sheridan's popularity was interrupted, and the peace of the theatre disturbed, by the riotous behaviour of a young gentleman, who, being the worse for liquor, raised a quarrel, and formed such a powerful party that the theatre was obliged to be shut for some time. Two trials were commenced before the court of king's bench; the manager was tried for an assault on the young gentleman, and acquitted; but, in the other trial, the rioter was found guilty, and sentenced to pay a fine of £500, and to be imprisoned three months. After being confined one week, he made concessions to Mr. Sheridan, who solicited government to remit the fine, and succeeded. He also became bail himself for the young man's enlargement, and obtained it. This affair, so disagreeable in its commencement, and so honorable to Mr. Sheridan in its conclusion, was productive of a very fortunate event. During the public controversy about the riots, Miss Frances Chamberlaine, a most accomplished young lady, wrote a pamphlet in favor of the manager, which attracted Mr. Sheridan's attention and gratitude to such a degree that he soon after obtained an introduction to his fair champion, and married her. The harmony of the theatre, after this event, met with no interruption till 1754, when politics ran high. Mr. Sheridan had instituted a club, consisting of about fifty noblemen and members of parliament, who dined weekly at his apartment in the theatre. No lady was admitted but Mrs. Woffington, who presided. The manager had no party views, but Mrs. Woffington diverted it from its original design; and, the toasts being generally in favor of the court, Mr. Sheridan himself became obnoxious. On the 25th of February, 1754, Mr. Digges, in the tragedy of Mahomet, was entored for a speech that contained some severe imprecations against venal senators and courtiers. Digges gratified the audience, repeated the speech, and received reiterated plaudits. In

the green-room Mr. Sheridan remarked Digges's conduct as a circumstance of self degradation. The tragedy was again acted, and Digges's speech again encored. Digges expressed his readiness to comply, but urged that his compliance would injure him with the manager. The vociferation for the manager then became universal. Sheridan, afraid of personal insult, went home. Repeated messages were sent for him in vain; and, after waiting a full hour, the audience rose in a mass and destroyed the inside of the house. Mr. Sheridan published a state of his case, left the theatre for two years, and embarked for England. At London he appeared, in 1754, on the Covent Garden boards in Hamlet. He also performed Coriolanus, Cato, Edipus, Richard III., Shylock, lord Townly, Romeo, &c., but his profits fell short of his hopes. Besides, Garrick was a rival whom it was impossible for any man to rival. In 1756, the term of this theatre at Dublin being expired, he went over, in hopes that the public ferment was also expired. An apology, however, was deemed necessary: the house was crowded, and never did any man, in such a situation, appear with more address, or speak to the passions with so much propriety. Tears fell from many, and pardon was sealed by the plaudits of all. Rivalship, and opposition, however, arose from a new quarter. Barry and Woodward had engaged to erect a new theatre in Crow Street. Mr. Sheridan struggled to maintain his ground for three years; but gave it up on the 27th of April, 1759. Meantime, he had composed his Lectures on Elocution, and began to deliver them at London, Oxford, Cambridge, &c., with great success. In 1759 he took his degree at Cambridge. In 1760 he engaged with Mr. Garrick at Drury Lane. But the king's public approbation of Mr. Sheridan's John excited Garrick's jealousy so much that he would not permit that play to be again performed. Hence disputes arose, and they parted. In 1769 Mr. Sheridan exhibited at the Haymarket, the Attic Evening Entertainment, consisting of reading, singing, and music, and met with great success. Previous to this, in 1756, he had published British Education, or the Source of the Disorders of Great Britain; being an essay to prove that the immorality, ignorance, and false taste, which so generally prevail, are the consequences of the present defective system of education; &c. This was followed, in 1758, by a very spirited Oration on the Establishment of a Proper Mode of Education in Ireland. He had delivered it before the nobility and gentry at the Music Hall in Dublin, December 6th, 1757. In 1759 he published a discourse delivered at Oxford, introductory to his Lectures on Elocution. In 1762 appeared his Dissertation on the Causes of the Difficulties which occur in learning English: also his Course of Lectures on Elocution. In 1769 he published A Plan of Education for the Young Nobility and Gentry of Great Britain. In 1775 Lectures on the Art of Reading, and in 1780 his General Dictionary of the English Language; in 2 vols. 4to. Its main object is to establish a plain and permanent standard of pronunciation. In 1784 he published a new edition of Swift's

Works, in 17 vols. 8vo. His last work was, in 1785, *Elements of English*; being a new method of teaching the whole art of reading; 12mo. At the accession of his majesty, in 1760, a pension was conferred on Mr. Sheridan. He also gave lectures on reading in Scotland, where he was honored with much attention, by the principal literati. About 1764 he went to France, and resided at Blois, where his wife died. On Mr. Garrick's retiring from the stage, in 1776, the purchasers of his share in Drury Lane invested Mr. Sheridan with the powers of manager; but he relinquished it in 1779. In 1786 he visited Ireland, but returned to England, and died at Margate, August 14th, 1788.

SHERIDAN (Mrs. Frances), wife of the preceding, was born in Ireland about 1724, but descended from a good English family which had removed thither. Her maiden name was Chamberlaine. Her first literary performance procured her marriage. She was a person of the most engaging manners. After lingering some years in a very weak state of health, she died at Blois, in the South of France, September 26th, 1766. Her *Sidney Biddulph* may be ranked with the first productions of that class in our or any other language. She also wrote a little romance in one volume called *Nourjahad*, in which there is a great deal of imagination, productive of an admirable moral. And she was the authoress of two comedies, the *Discovery*, and the *Dupe*. By Mr. Sheridan, she became the mother of two splendid ornaments to this family of genius: viz. Charles Francis Sheridan, esq., late secretary at war in Ireland, and author of an excellent *History of the Revolution in Sweden*, in 1772; and Richard Brinsley Sheridan, esq., M. P., a celebrated dramatic writer, and one of the most eminent orators, and uniformly steady patriots in the British senate.

SHERIDAN (Richard Brinsley), esq., the third and youngest son of Thomas Sheridan, was distinguished both as a statesman and a dramatist. He was born in Dorset Street, Dublin, October 30th, 1751. The early development of his talents was greatly aided by the instructions of his mother: he was afterwards placed at a grammar school in Dublin, whence, in 1759, he was removed in consequence of his parents leaving Ireland. They settled at Windsor, and he remained at home till 1762, when he was sent to Harrow, which seminary he left at the age of eighteen, owing to his father's embarrassments. He entered subsequently as a student of the middle temple; but the close application and industry requisite for success as a lawyer were incompatible with his disposition; and an early marriage induced him to look out for some more immediate means of support. Having very soon after his marriage dissipated the moderate property with which he set out in the world, he turned his attention to dramatic composition. His first production was the comedy of the *Rivals*, acted at Covent Garden in January 1775, with moderate success; but the *Duenna*, a musical entertainment, which followed, was received with general admiration; and his *School for Scandal* gained him the highest reputation as a comic writer. On the retirement of Garrick from the

management of Drury Lane Theatre, Sheridan, in conjunction with Dr. Forde and Mr. Linley, purchased Garrick's share of the patent. This property qualified him for a seat in parliament; and in 1780 he was chosen member for the borough of Stafford. Sheridan joined the opposition, and displayed so much ability that on the retreat of the premier, and the conclusion of the American war, he was made under secretary of state for the war department. He resigned with his principal, in consequence of a dispute with lord Shelburne, afterwards marquis of Lansdowne, who was at the head of the ministry. His intimate connexion with Fox brought him again into office on the coalition of that statesman with lord North, when Sheridan held the post of joint secretary of the treasury under the late duke of Portland. The dissolution of that ministry threw him again into the ranks of opposition, where he remained during the whole period of the ministry of Mr. Pitt. He now attained distinguished celebrity as a parliamentary orator: but the grandest display of his eloquence occurred during the progress of the impeachment of Warren Hastings. In 1792 Mr. Sheridan lost his wife, who left one son; and three years afterwards married Miss Ogle, daughter of the dean of Winchester. With this lady he had a fortune, which enabled him to purchase the estate of Polesdon, in Surrey; and he held the office of receiver-general of the duchy of Cornwall, worth £1200 a year. The political changes consequent to the death of Mr. Pitt, in 1806, occasioned the exaltation of the party with which Sheridan was connected, and he obtained the lucrative post of treasurer of the navy, and the rank of a privy counsellor. This administration being weakened by the death of Mr. Fox, new alterations took place, and Sheridan was deprived of office, to which he never returned. At the election in 1806 he obtained a seat for Westminster, the great object of his ambition; but was afterwards nominated for the borough of Hchester, which he continued to represent during the remainder of his public career. The latter part of the life of this talented individual was embittered by misfortunes, arising principally from his own indolence and mismanagement, the destruction of Drury Lane Theatre by fire, &c. When the affairs of that establishment were arranged, in 1811, Mr. Sheridan and his son were to have on various accounts £40,000 for their share of the property; but the portion of the former was not sufficient to liquidate his debts. The dissolution of parliament, and his failure in an attempt to obtain a seat for Stafford, the borough he had formerly represented, completed his ruin. In 1812 he had relinquished all thoughts of returning to the house of commons; and the remainder of his existence was spent in attempts to ward off the evils to which his improvidence had exposed him. At length the disappearance of his property was followed by arrest, and though, after a few days' detention, he was released, it was only to experience apprehension and alarm, from which he sought a temporary relief in that unrestrained indulgence which had occasioned his misfortunes. Intemperance had undermined his constitution; and, until on the

bel of death, he was not exempted from the terrors of arrest for debt; his death took place July 7th, 1816. Besides the plays already mentioned, Sheridan was the author of *St. Patrick's Day*, or the Scheming Lieutenant, a farce; *A Trip to Scarborough*, a comedy, altered from Vanbrugh; the *Camp*, a farce; the *Critic*, or the Tragedy Rehearsed; *Robinson Crusoe*, or *Harlequin Friday*, a pantomime; and *Pizarro*, a play, from the German of Kotzebue. He also wrote *Verses to the Memory of Garrick*, 1779, 4to.; and a *Comparative Statement of the two Bills for the better Government of the British Possessions in India*, 1738, 4to. As a dramatist he may be deemed the head of that line of comedy which exhibits the malice, detraction, intrigue, and persiflage, of the more cultivated stations of life. Like Congreve, Sheridan has incurred the imputation of giving a portion of wit to all his characters to a correspondent destruction of nature. This may be true, and still leave the *School for Scandal* the head of the comic modern drama in its own peculiar walk. The works of Sheridan appeared in 1821, in 2 vols. 8vo., edited by Mr. Thomas Moore, who has published an interesting life of our author.

SHERIDAN (Elizabeth), daughter of Thomas Linley, the musician, first wife of the celebrated R. B. Sheridan. She was alike distinguished for her beauty, her manners, and her musical talents. In Handel's pathetic songs, in Purcell's *Mad Bess*, in the upper part of serious glees, or in any vocal music expressive of passion, she was sure to delight. Sacchini, on hearing Miss Linley sing for the last time in public at Oxford, observed that, if she had been born in Italy, she would have been as much superior to all Italian singers as she was then to all of her own country. She relinquished her profession on her marriage with Sheridan in 1773; her death took place in 1792.

SHERIFF, *n. s.* } Sax. *rycne*, *γενεφα*, from
SHERIFFALTY, } *rycne*, a shire, and *neve*,
SHERIFFWICK. } a steward. Sometimes pronounced shrieve, which the poets have therefore injudiciously adopted. An officer to whom is entrusted, in each county, the execution of the laws (see below); his office.

A great power of English and of Scots
Are by the *sheriff* of Yorkshire overthrown.

Shakespeare.

Concerning ministers of justice, the high *sheriffs* of the counties have been very ancient in this kingdom.

Bacon.

There was a resumption of patents of gaols, and reannexing of them to the *sheriffwicks*; privileged officers being no less an interruption of justice than privileged places.

Bacon.

Now mayors and *shrieves* all hushed and satiate lay.

Pope.

A SHERIFF is an officer, in each county in England, nominated by the king, invested with a judicial and ministerial power, and who takes place of every nobleman in the county during the time of his office. The office is of very great antiquity. He is called in Latin *vice-comes*, as being the deputy of the comes, or earl, to whom the custody of the shire was committed at the first division of England into counties. But the earls, in process of time, by their high employ-

ments and attendance on the king's person, not being able to transact the business of the county, were delivered of that burden; reserving themselves the honor, but the labor was laid on the sheriff. So that now the sheriff does all the king's business in the county; and, though he be still called *vice-comes*, yet he is entirely independent of, and not subject to, the earl; the king, by his letters patent, committing *custodiam comitatus* to the sheriff, and to him alone. Sheriffs were formerly chosen by the inhabitants of the several counties. It was ordained by stat. 28 Edw. I. c. 8, that the people should have an election of sheriffs in every shire where the sheriffdom is not of inheritance. For anciently in some counties the sheriffs were hereditary: as they were in Scotland till the stat. 20 Geo. II. c. 43; and still continue in the county of Westmoreland to this day: the city of London having also the inheritance of the sheriffdom of Middlesex vested in their body by charter. The reason of these popular elections is assigned in the same statute, c. 13, 'that the commons might choose such as would not be a burden to them.' And herein appears plainly a strong trace of the democratical part of our constitution; in which form of government it is an indispensable requisite that the people should choose their own magistrates. This election, however, was not absolutely vested in the commons, but required the royal approbation. For, in the Gothic constitution, the judges of their county courts (which office is executed by the sheriff) were elected by the people, but confirmed by the king; and the form of their election was thus managed: the people, or *incolæ territorii*, chose twelve electors, and they nominated three persons, *ex quibus rex unum confirmabat*. But with us, in England, these popular elections, growing tumultuous, were put an end to by the stat. 9 Edw. II. st. 2, which enacted that the sheriffs should henceforth be assigned by the chancellor, treasurer, and the judges. By stat. 14 Edw. III. c. 7, 23 Hen. VI. c. 8, and 21 Hen. VIII. c. 20, the chancellor, treasurer, president of the king's council, chief justices, and chief baron, are to make this election; and that on the morrow of All Souls, in the exchequer. And the king's letters patent, appointing the new sheriffs, used commonly to bear date the 6th day of November. The stat. of Cambridge, 12 Rich. II. c. 2, ordains that the chancellor, treasurer, keeper of the privy seal, steward of the king's house, the king's chamberlain, clerk of the rolls, the justices of the one bench and the other, barons of the exchequer, and all other that shall be called to ordain, name, or make justices of the peace, sheriffs, and other officers of the king, shall be sworn to act indifferently, and to name no man that sueth to be put in office, but such only as they shall judge to be the best and most sufficient. And the custom now is (and has been since the time of Fortescue, chief justice and chancellor to Henry VI.) that all the judges, with the other great officers, meet in the exchequer chamber on the morrow of All Souls yearly (now altered to the morrow of St. Martin by the last act for abbreviating Michaelmas term), and then:

and there propose three persons to the king, who afterwards appoints one of them to be sheriff. But, notwithstanding the unanimous resolution of all the judges of England to the above purpose, and the statute 34 and 35 Hen. VIII. c. 26. § 61, which expressly recognises to be the law of the land, some have affirmed that the king, by his prerogative, may name whom he pleases to be sheriff, whether chosen by the judges or not. This is grounded on a very particular case in the fifth year of queen Elizabeth, when by reason of the plague there was no Michaelmas term kept at Westminster; so that the judges could not meet there *incrastino animarum* to nominate the sheriffs: whereupon the queen named them herself, without such previous assembly, appointing for the most part one of two remaining in the last year's list. And this case, thus circumstanced, is the only authority in our books for the making these extraordinary sheriffs. It is true, the reporter adds, that it was held that the queen by her prerogative might make a sheriff without the election of the judges *non obstante aliquo statuto in contrarium*; but the doctrine of *non obstante*, which sets the prerogative above the laws, was effectually demolished by the bill of rights at the revolution, and abdicated Westminster-hall when king James abdicated the kingdom. However, the practice of occasionally naming what are called pocket sheriffs, by the sole authority of the crown, uniformly continued to the reign of his late majesty; in which it is believed, few (if any) instances occurred. Sheriffs, by virtue of several old statutes, are to continue in their office no longer than one year; and yet it has been said that a sheriff may be appointed *durante bene placito*, or during the king's pleasure; and so is the form of the royal writ. Therefore, till a new sheriff be named, his office cannot be determined, unless by his own death, or the demise of the king; in which last case it was usual for the successors to send a new writ to the old sheriff; but now, by statute 1 Anne st. 1 c. 8, all officers appointed by the preceding king may hold their offices for six months after the king's demise, unless sooner displaced by the successor. By statute 1 Ric. II. c. 11, no man that has served the office of sheriff for one year can be compelled to serve the same again within three years after. The power and duty of a sheriff are either as a judge, as the keeper of the king's peace, as a ministerial officer of the superior courts of justice, or as the king's bailiff.

1. In his judicial capacity he is to hear and determine all causes of 40s. value and under, in his county court; and he has also a judicial power in divers other civil cases. He is likewise to decide the elections of knights of the shire (subject to the control of the house of commons), of coroners, and of verderers; to judge of the qualification of voters, and to return such as he shall determine to be duly elected.

2. As the keeper of the king's peace, both by common law and special commission, he is the first man in the county, and superior in rank to any nobleman therein during his office. He may apprehend and commit to prison all persons who break the peace, or attempt to break it; and may bind any

one in recognizance to keep the king's peace. He may, and is bound, *ex officio*, to pursue and take all traitors, murderers, felons, and other misdoers, and commit them to gaol for safe custody. He is also to defend his county against any of the king's enemies when they come into the land; and for this purpose, as well as for keeping the peace and pursuing felons, he may command all the people of his county to attend him; which is called the *posse comitatus*, or power of the county; which summons, every person above fifteen years old, and under the degree of a peer, is bound to attend upon warning, under pain of fine and imprisonment. But though the sheriff is thus the principal conservator of the peace in his county, yet, by the express directions of the great charter, he, together with the constable, coroner, and certain other officers of the king, are forbidden to hold any pleas of the crown, or, in other words, to try any criminal offence. For it would be highly unbecoming that the executioners of justice should be also the judges; should impose, as well as levy, fines and amercements; should one day condemn a man to death, and personally execute him the next. Neither may he act as an ordinary justice of the peace during the time of his office; for this would be equally inconsistent, he being in many respects the servant of the justices.

3. In his ministerial capacity, the sheriff is bound to execute all processes issuing from the king's courts of justice. In the commencement of civil causes, he is to serve the writ, to arrest, and to take bail; when the cause comes to trial, he must summon, and return the jury; when it is determined, he must see the judgment of the court carried into execution. In criminal matters, he also arrests and imprisons; he returns the jury; he has the custody of the delinquent, and he executes the sentence of the court, though it extend to death itself.

4. As the king's bailiff, it is his business to preserve the rights of the king within his bailiwick; for so his county is frequently called in the writs: a word introduced by the princes of the Norman line, in imitation of the French, whose territory was anciently divided into bailiwicks as that of England into counties. He must seize to the king's use all lands devolved to the crown by attainder or escheat; must levy all fines and forfeitures, must seize and keep all waifs, wrecks, estrays, and the like, unless they be granted to some subject; and must also collect the king's rents within his bailiwick, if commanded by process from the exchequer. To execute these various offices, the sheriff has under him many inferior officers; as under-sheriff, bailiffs, and gaolers, who must neither buy, sell, nor farm their offices on forfeiture of £500. The under-sheriff usually performs all the duties of the office; a very few only excepted, where the personal presence of the high sheriff is necessary. But no under-sheriff shall abide in his office above one year and if he does, by stat. 23 Hen. VI. c. 8, he forfeits £200, a very large penalty in those early days. And no under-sheriff or sheriff's officer shall practise as an attorney during the time he continues in such office: for this would be a great inlet to partiality and oppression. But

these salutary regulations are shamefully evaded, by practising in the names of other attorneys, and putting in sham deputies by way of nominal under-sheriffs: by reason of which, says Dalton, the under-sheriffs and bailiffs dogrow so cunning in their several places that they are able to deceive, and it may well be feared that many of them do deceive, both the king, high-sheriff, and the county.

The Scotch sheriff differs very considerably from the English sheriff. The Scotch sheriff is properly a judge; and, by stat. 20 Geo. II. c. 43, he must be a lawyer of three years' standing; and is declared incapable of acting in any cause for the county of which he is sheriff. He is called sheriff depute: he must reside within the county four months in the year: he holds his office *ad vitam aut culpam*. He may appoint substitutes, who as well as himself receive stated salaries. The king may appoint a high-sheriff for the term of one year only. The civil jurisdiction of the sheriff depute extends to all personal actions on contract, bond, or obligation, to the greatest extent: and generally in all civil matters not especially committed to other courts. His criminal jurisdiction extends to the trial of murder, though the regular circuits of the court of judicary prevent such trials occurring before him. He takes cognizance of theft and other felonies, and all offences against the police. His ministerial duties are similar to those of sheriffs in England.

The lord mayor and citizens of London have the shrievalty of London and Middlesex in fee, by charter; and two sheriffs are annually elected by them, for whom they are to be answerable. If one of these sheriffs dies, the other cannot act till another is made; and there must be two sheriffs of London, which is a city and county; though they make but one sheriff of the county of Middlesex; they are several as to plaints in their respective courts. 3 Rep. 72: Show. Rep. 289.

SHERLOCK (Dr. Richard), an English divine, who was educated first at Magdalene College Oxford, and afterwards at Trinity College Dublin. During the civil war he came to England, where he was appointed chaplain of a regiment. About 1660 he received the degree of D. D. from the university of Dublin, and was presented by the earl of Derby with the rich benefice of Winwick. He wrote a treatise entitled *The Practical Christian*, and died in 1689.

SHERLOCK (Dr. William), a learned English divine, born in 1641, and educated at Eton school, where he distinguished himself by the vigor of his genius. Thence he was removed to Cambridge, where he took his degrees. In 1669 he became rector of the parish of St. George, Botolph Lane, London; and in 1681 prebendary of Pancras, in the cathedral of St. Paul's. He was likewise chosen master of the Temple and rector of Therfeld in Hertfordshire. After the Revolution he was suspended for refusing the oaths to king William and queen Mary; but at last he took them, and publicly justified what he had done. In 1691 he was installed dean of St. Paul's. His *Vindication of the Doctrine of the Trinity* engaged him in a warm controversy

with Dr. South and others. Bishop Burnet says he was 'a clear, a polite, and a strong writer; but apt to assume too much to himself, and to treat his adversaries with contempt.' He died in 1702. His works are very numerous; among these are, 1. *A Discourse concerning the Knowledge of Jesus Christ*, against Dr. Owen. 2. Several pieces against the Papists, the Socinians, and Dissenters. 3. *A Practical Treatise on Death*, which is much admired. 4. *A practical Discourse on Providence*. 5. *A practical Discourse on the future judgment*; and many other works.

SHERLOCK (Thomas), D. D., bishop of London, the son of the preceding, was born in 1678. He was educated in Catherine Hall, Cambridge, where he took his degrees, and of which he became master; he was made master of the Temple very young, on the resignation of his father; and it is remarkable that this mastership was held by father and son successively for more than seventy years. He was at the head of the opposition against Dr. Hoadly bishop of Bangor; during which contest he published a great number of pieces. He attacked the famous Collins's *Grounds and Reasons of the Christian Religion*, in a course of six sermons, preached at the Temple church, which he entitled *The Use and Intent of Prophecy in the several Ages of the World*. In 1728 he was appointed bishop of Bangor; and of Salisbury in 1734. In 1747 he refused the archbishopric of Canterbury, on account of ill health; but, recovering, he accepted the see of London in 1748. On occasion of the earthquakes, in 1750, he published an excellent Pastoral Letter to the clergy and inhabitants of London and Westminster: of which it is said there were printed in 4to. 5000 copies; in 8vo. 20,000; and in 12mo. about 30,000; besides pirated editions, of which not less than 50,000 were said to have been sold. Under the weak state of body in which he lay for several years, he revised and published 4 vols. of *Sermons* in 8vo., which are particularly admired for their ingenuity and elegance. He died in 1762, worth £150,000. 'His learning,' says Dr. Nicholls, 'was very extensive: God had given him an understanding mind, a quick comprehension, and a solid judgment. His skill in the civil and canon law was very considerable; to which he added such a knowledge of the common law of England as few clergymen attain to.' Dr. Nicholls mentions also his exemplary piety, his zeal in preaching the duties, and maintaining the doctrines of Christianity, and his diffusive munificence and charity; particularly to the corporation of clergymen's sons, to several hospitals, and to the society for propagating the gospel in foreign parts: his bequeathing to Catherine Hall in Cambridge, the place of his education, his valuable library of books, and his donations for the founding a librarian's place and a scholarship, to the amount of several thousand pounds.

SHERIFFE OF MECCA, the title of the descendants of Mahomet by Hassan Ibn Ali. These are divided into several branches, of which the family of Ali Bunemi, consisting at least of 300 individuals, enjoy the whole right to the throne of Mecca. The Ali Bunemi are again subdivided into two subordinate branches, Darii

Sajid, and Darii Barkad; of whom sometimes the one, sometimes the other, have given sovereignties to Mecca and Medina, when these were separate states. Not only is the Turkish sultan indifferent about the order of succession in this family, but he seems even to foment the dissensions which arise among them, and favors the strongest, merely that he may weaken them all. As the order of succession is not determinately fixed, and the sheriffs may all aspire alike to the sovereign power, this uncertainty of right, aided by the intrigues of the Turkish officers, occasions frequent revolutions. The grand sherriffe is seldom able to maintain himself on the throne; and it still seldomer happens that his reign is not disturbed by the revolt of his nearest relations. There have been instances of a nephew succeeding his uncle, an uncle succeeding his nephew; and sometimes of a person, from a remote branch, coming in the room of the reigning prince of the ancient house. When Niebuhr was in Arabia, 1763, the reigning sherriffe had sat fourteen years on the throne, and during all that period had been continually at war with the neighbouring Arabs, and with his own nearest relations. A few years before the pacha of Syria had deposed him, and raised his younger brother to the sovereign dignity in his stead. But after the departure of the caravan, Jafar, the new sherriffe, not being able to maintain himself on the throne, was obliged to resign the sovereignty again to Mesad. Achmet, the second brother of the sherriffe, who was beloved by the Arabs, threatened to attack Mecca while Niebuhr was at Jidda. Our traveller was soon after informed of the termination of the quarrel, and of Achmet's return to Mecca, where he continued to live peaceably in a private character. The dominions of the sherriffe comprehended the cities of Mecca, Medina, Jambo, Taaf, Sadie, Ghunfude, Hali, and thirteen others less considerable, all situated in Hedjas. Near Taaf is the lofty mountain of Gazvan, which, according to Arabian authors, is covered with snow in the midst of summer. As these dominions are neither opulent nor extensive, the revenue of their sovereign cannot be considerable. He finds a rich resource, however, in the imposts levied upon pilgrims, and in the gratuities offered him by Mussulman monarchs. Every pilgrim pays a tax of from ten to 100 crowns, in proportion to his ability. The great Mogul remits annually 60,000 rupees to the sherriffe, by an assignment upon the government of Surat. Indeed, since the English made themselves masters of this city and the territories belonging to it, the nabob of Surat has no longer been able to pay the sum. The sherriffe once demanded it of the English possessors of Surat; and, till they should satisfy him, forbade their captains to leave the port of Jidda. But, the English disregarding this prohibition, the sherriffe complained to the Ottoman Porte, and they communicated his complaints to the English ambassador. He at the same time opened a negotiation with the nominal nabob, who resides at Surat. But these steps proved all fruitless: and the sovereignty of Mecca seems not likely to be ever more benefited by the contribution from India. The power of the sherriffe

extends not to spiritual matters; these are entirely managed by the heads of the clergy, of different sects, who reside at Mecca. Rigid Mussulmans, such as the Turks, are not very favorable in their sentiments of the sherriffes, but suspect their orthodoxy, and look upon them as secretly attached to the tolerant sect of the Zedi.

SHER'RS, n. s. } From Xeres, a town of
SHER'RS SACK, } Andalusia in Spain. A
SHER'RY. } kind of Spanish wine.

Your *sherris* warms the blood, which, before cold and settled, left the liver white, which is the badge of pusillanimity; but the *sherris* makes it course from the inwards to the parts extreme. *Shakspeare.*

Good *sherris sack* ascends me into the brain, dries me there all the foolish dull vapours, and makes it apprehensive. *Id.*

SHERSHELL, a town of Africa, in Algiers, supposed to be the ancient Jol, which was called Casarea by Juba II. in honor of Augustus Cæsar. The ruins upon which it is situated are not inferior in extent to those of ancient Carthage; and its former magnificence appears from its numerous fine pillars, capitals, mosaic pavements, capacious cisterns, and other relics of antiquity that are still to be seen. Tradition says that all this catastrophe was occasioned by a great earthquake; and that the harbour, formerly large and commodious, was destroyed and choked up by the arsenal and other adjacent buildings being thrown into it by the shock. This tradition, though not recorded in history, is confirmed by the rubbish, walls, pillars, marbles, &c., being distinctly visible at low water, as well as by another recent catastrophe of the same kind; for in 1738 this city was entirely overthrown by another earthquake. In 1730, eight years before this last catastrophe, Dr. Shaw visited it, and describes it as then in high reputation for manufactures in iron and steel, earthen wares, &c. What remains of the harbour is nearly of a circular form, about 200 yards in diameter, and has an island in the middle of it; which, being a high rock, is its chief defence against the blasts of Boreas. Long. 2° 36' E., lat. 36° 35' N.

SHERWIN (John Keyse), an eminent modern English engraver, was originally a wood cutter on the estate of Mr. Mitford, in Sussex; but going one day to that gentleman's house on some business, he was admitted into a room where some of the family were drawing, to whom he paid such attention that Mr. Mitford asked him if he could draw any? Sherwin replied 'he could not tell, but should like to try:' on which a portcrayon was given him, when he immediately produced a drawing that astonished not only all present, but the Society of Arts, to whom Mr. Mitford presented it, and who voted him their silver prize medal in consequence. Being soon after removed to London he entered under Bartolozzi, and in three years made such surprising proficiency that he obtained both the gold and the silver prize medals given by the society. After this he executed many capital engravings; among which his Finding of Moses is esteemed one of the best works of the present age. He died in 1790.

SHERWOOD, a spacious forest in the west

part of Nottinghamshire, which formerly occupied the greatest part of it. It was so thick that it was hardly passable; but it is now thinner, and its extent is much contracted. In the twelfth and thirteenth centuries this forest was the head quarter of Robin Hood, Little John, and their gang of thieves. It now feeds a vast number of deer and stags; and has some towns in it, of which Mansfield is the chief. It abounds in coal, and a road lies through it for thirty miles together. Since the reign of king Edward I. the nobility and gentry have had grants of it. It was once governed by a great number of officers under the earl of Chesterfield, chief forester; whose ancestor, Sir John Stanhope, had a grant of it, with liberty to kill deer at pleasure, reserving only 100 deer in the whole walk.

S H E T L A N D, or Z E I L A N D, the name of certain islands belonging to Scotland, and lying north-east of Orkney, between lat. $59^{\circ} 56'$ and $61^{\circ} 11'$. There are many convincing proofs that these islands were very early inhabited by the Picts, or rather by those nations who were the original possessors of the Orkneys; and at the time of the total destruction of these nations, if any credit be due to tradition, their woods were entirely ruined, either by the Scots or Norwegians. It is highly probable that the people in Shetland, as well as in the Orkneys, flourished under their own princes dependent upon the crown of Norway; yet this seems to have been rather through what they acquired by fishing and commerce than by the cultivation of their lands. Many reasons might be assigned why these islands, though part of our dominions, have not hitherto been better known to us. They were commonly placed two degrees too far to the north in all the old maps, to make them agree with Ptolemy's description of Thule, which he asserted to be in lat. 23° ; which we find urged by Camden as a reason why Thule must be one of the Shetland isles, to which Speed also agrees, though from their being thus wrong placed he could not find room for them in his maps. Another cause was the many false and fabulous relations published concerning them, as if they were countries inhospitable and uninhabitable; and, lastly, the indifference or rather indifference of the natives, who, contenting themselves with those necessities and conveniences procured by their intercourse with other nations, and conceiving themselves neglected by the mother country, have seldom troubled her with their applications. There are few countries that have gone by more names than these islands: they were called in Islandic Hialtlandia, from hialt the hilt of a sword; this might be corrupted into Hetland, Hitland, or Hethland, though some tell us this signifies a high land. They have been likewise, and are still in some maps, called Zetland and Zealand, in reference, as has been supposed, to their situation. By the Danes and by the natives they are styled Yealtaland; and, notwithstanding the oddness of the orthography, this differs very little if at all from their manner of pronouncing Zetland, out of which pronunciation grew the modern names of Shetland and Shotland.

The Shetland Isles contain nearly three times as much land as the Orkneys; they are consi-

dered also as equal in size to the island of Madeira, and not inferior to the provinces of Utrecht, Zealand, and all the rest of the Dutch islands taken together; but of climate and soil they have little to boast. The longest day in the island of Unst is nineteen hours fifteen minutes, and of consequence the shortest day four hours and forty-five minutes. The spring is very late, the summer very short; the autumn also is of no long duration, dark, foggy, and rainy; the winter sets in about November and lasts till April, and sometimes till May. They have frequently in that season storms of thunder, much rain, but little frost or snow. High winds are indeed very frequent and very troublesome, yet they seldom produce any terrible effects. The aurora borealis is as common here as in any of the northern countries, and it contributes greatly to dispel the gloom of the long winter nights; as the splendor of its irradiations through the whole atmosphere often affords a light equal to that of the full moon. See AURORA BOREALIS. In winter the sea swells and rages in such a manner that for five or six months their ports are inaccessible, and the people during that space have no correspondence with the rest of the world.

'These islands,' says Mr. Jameson, F.A.S.S., and F.R.M.S., in his Mineralogy of the Shetland Islands, 'are very numerous, but few or them of any considerable magnitude; thirty-three of them are inhabited. On viewing these islands in general a wonderful scene of rugged, bleak, and barren rocks, presents itself to view. No tree or shrub is to be seen to relieve the eye in wandering over these dreary scenes. Sometimes, however, a few scanty portions of cultivated ground catch the eye of the traveller, exciting emotions of pleasure, and forming a striking contrast to the barren heath-covered mountains which skirt them. The coasts are in general rugged and precipitous, presenting in many places scenes truly grand and magnificent; vast rocks of various heights dreadfully rugged and broken, opposing their rude fronts to all the fury of a tempestuous ocean; which in some places has formed great detached pillars, in others has excavated great natural arches and caverns, that mock all human magnificence, and strike the beholder with that awe and wonder which must affect every one on viewing these amazing wrecks of nature.'

The Shetland Islands are well situated for trade. The nearest continent to them is Norway; the port of Bergen lying forty-four leagues east; whereas they lie forty-six leagues N.N.E. of Buchanness; about seventeen or eighteen E.N.E. of Sanda, one of the Orkneys; six or seven north-east of Fair Isle; fifty-eight east of Ferroe Isles; and at nearly the same distance north-east of Lewis. The southern promontory of the main land, called Sumburgh Head, lies $59^{\circ} 59'$ lat. N., and the north extremity of Unst, the most remote of them all, in lat. $61^{\circ} 15'$. The meridian of London passes through this last island, which lies about $2^{\circ} 30'$ W. of Paris, and about $5^{\circ} 15'$ E. of cape Lizard.

The ancient history of these islands, like that of most other countries, is lost in the wreck of time. It is even uncertain who were the first

inhabitants. The general opinion is that they were first settled by a colony of Norwegians; but the Rev. James Gordon thinks it more probable that the Picts were the first who settled in them, for the following reasons:—1. We have no accounts in ancient history that the Danes were possessed of these islands previous to the year 830; when the Picts were so completely defeated and dispersed by Kenneth II. that they were obliged to desert their ancient territories and fly northward, as recorded by Bede, Boece, and all our ancient historians. 2. The Frith that divides Caithness from Orkney is often called the Pictland Frith, from a great number of the Picts having been drowned in it in their flight from the Scots after Kenneth's victory. As the whole of the Picts who got safe landed in Orkney could not be accommodated in that country, a great number of them set sail again for the next land which was in view, viz. the island of Fowla; but, this being still too small to accommodate them all, they were at a loss what course to take, till some of them observing a thick mist, directly north-east of Fowla, they steered towards it, and the first person who observed the land cried out, 'There is zet land, and we shall be safe,'—zet being the ancient spelling at least, if it was not the pronunciation of the word yet; and hence it was named Zetland. This use of the Z instead of Y was retained in Scotland so late as the reign of queen Mary, when books in the Scottish language were printed at Edinburgh with the words ze, zow, and zieres, for ye, you, and yours. And the same orthography is still retained in Mackenzie, Menzies, Zuill (for Yule), and some other surnames in Scotland. The Picts accordingly settled on the Zetland Isles, which till that period had never been inhabited, and erected broughs or castles on the highest hills in each of the islands, that by lighting fires in them they might all have speedy warning of the approach of an enemy within less than an hour. Having thus secured themselves they sent ambassadors to the court of Norway, soliciting assistance to recover their ancient country from the Caledonians. Harold, then king of Norway, being a warlike prince, readily complied, espoused their cause, and sent a powerful fleet, which landed on the isle of Fetlar; but, as no safe anchorage could be procured on that coast, they sailed to the isle of Unst, to a bay which still retains his name, being called Harold's Wick; and this is still the tradition of the country respecting this name. Harold remained in this bay with his fleet till he had collected all the Picts in Scotland able to bear arms; when he set sail for the coast of Sutherland and Caithness; both of which countries he soon conquered, and they remained tributary to the crown of Norway till the end of the twelfth century; when William the Lion, king of Scots, conquered the Norwegians, and re-annexed these two countries to Scotland. The Picts, being thus frustrated in their hopes of recovering their ancient dominions, contented themselves with returning to Orkney and Zetland again; and, being joined by a great number of Danish adventurers, they intermarried together, and became one people, acknowledging the king of Denmark as their sovereign. At last they were finally ceded by

Christian IV., king of Denmark and Norway, to king James VI. by way of dowry, with his daughter the princess Anne. See SCOTLAND.

The inhabitants are a stout well-made people; the lower sort of a swarthy complexion, hardy, robust, and laborious people. Generally speaking they get their bread by fishing in all weathers in their yawls, which are little bigger than Gravesend wherries; live hardily, and in the summer season mostly on fish; their drink, which, in reference to the British dominions, is peculiar to the country, is called bland, and is a sort of butter-milk, long kept, and very sour. Many live to a great age; while others, by drinking great quantities of malt spirits of the very worst sort, are afflicted with an inveterate scurvy; but the majority enjoy as good health as in any other country in Europe. They have no great propensity to agriculture, and are persuaded that their country is not fit for it. But they are very successful in their pasture grounds, which are kept well enclosed, in good order, and, together with their commons, supply them plentifully with beef and mutton. They pay their rents generally in butter at Lammas, and in money at Martinmas. As they find no difficulty in providing for a family they marry very early, and a bachelor is considered as a sort of phenomenon. All that is requisite to enter on a married life in Shetland is a cow, a small hut, a pot, a yawl and fishing-tackle, and a rug or blanket. With these, though their crops could not maintain them above eight months in the year, yet, by the immense quantities of fish they catch, the cheapness of provisions in general, and the abundance of fuel, they live as comfortably, or more so, than most people of the same rank on the continent of Scotland.

The chief of the thirty-three inhabited islands of Shetland are, MAINEAND, YELL, UNST, BRESSAY, BURRAY, QUARFF, HAVERA, HOUSE, NOSS, FETLAR, FAIR, FOWLA, PAPASTOUR, the RHOES, SKERRIES, TRONDRAY, and WHALSAY. See these articles. The inhabitants of the Shetland Islands elect delegates, who join with those of the Orkney Islands in electing a representative in the British parliament. There are considerable quantities of marle in different islands, though they use but little; hitherto there has been no chalk found; limestone and freestone there are in the southern parts of the main land in great quantities, and also in the neighbouring islands, particularly Fetlar; and considerable quantities of slate, very good in its kind. No mines have been hitherto wrought, though there are in many places appearances of several kinds of metal. Some solid pieces of silver, it is said, have been turned up by the plough. In some of the smaller isles there are strong appearances of iron. See Jameson's Mineralogy.

The black cattle in this country are in general of a larger sort than in Orkney, which is owing to their having more extensive pastures; a clear proof that still farther improvements might be made in respect to size. Their horses, called Shelties, are small, but strong, stout, and well shaped, live very hardy, and to a great age. They have likewise a breed of small swine, the flesh of which, when fat, is esteemed very deli

cious. They have also a breed of small sheep, whose wool is equal, if not superior, to the finest Spanish wool. Otters, seals, and other amphibious animals, abound greatly on the coasts. They have no goats, hares, or foxes; in general no wild or venomous creatures of any kind; but there are rats in some few islands. They have no moor-fowl, which is the more remarkable as there are every where immense quantities of heath; but there are many sorts of wild and water-fowls, particularly the dunter, clack, and solan geese, swans, ducks, teal, whaps, foists, kittiwaiks, gulls, maws, plovers, cormorants, &c. There is likewise the amber goose, which is said to hatch her egg under her wing. Eagles, hawks, ravens, crows, mews, &c., abound here; and every person who kills an eagle is entitled to a reward of 5s. from the commissioners of supply.

All these islands are well watered; and there are every where excellent springs, some of them mineral and medicinal. They have, indeed, no rivers; but many pleasant burns, rills, or rivulets, of different sizes; in some of the largest they have admirable trouts, some of which are of fifteen and even of twenty pounds weight; and some of the larger rivulets even have salmon. They have likewise many fresh-water lakes, well stored with trouts and eels, and in most of them there are also large and fine flounders, in some very excellent cod. These fresh-water lakes, if the country was better peopled, and the common people more at their ease, are certainly capable of great improvement. They have, besides, had-docks, whittings, turbot, and a variety of other sea-fish. In many of the inlets there are prodigious quantities of excellent oysters, lobsters, mussels, cockles, and other shell-fish. Amber, ambergris, and other spoils of the ocean, are frequently found upon the coasts.

S H E T L A N D, MAINLAND OF, the largest of the Shetland islands, extends sixty miles from north to south, and is from six to eighteen in breadth. The interior parts are mountainous, craggy, and barren; but along the shores are verdant spots. The coast is so deeply indented with voes, or inlets of the sea, that no part of the island is five miles distant from some creek or harbour; while the extent of the coast, including all its windings, may be 300 miles. The hills run, in the longest direction of the island, from north to south; but none of them is very high, except Rona, near the north-west coast, which is between 1500 and 2000 feet above the level of the sea. On the highest eminence is a watch-house constructed of four large stones, and two covering the top for a roof. It will contain six or seven persons. The east side of the island is comparatively low; but the cliffs on the western coast are steep and irregular. There are many small fresh-water lakes, and some mineral springs impregnated with iron. Remains of what are called Picts' houses abound in this island. The soil is unfavorable for vegetation; and agriculture is little attended to. The best crops are black oats and bear, which would not supply the inhabitants nine months in the year. The hills are mostly covered with heath, and afford good pasture for black cattle and sheep, which, after receiving the mark of their owner, run wild, without the attendance of any shepherd. A con-

siderable number of sheep and black cattle are purchased by the Lerwick merchants, who kill them, and either send them to Leith, or to the Greenland and other vessels which rendezvous in Bressay Sound. They have also a very small but hardy breed of horses, called Shetland ponies; and a peculiar breed of swine, the flesh of which is esteemed very delicate. Eagles, hawks, ravens, and other birds of prey, are numerous, and so destructive to the lambs that the commissioners of supply give a crown for every eagle destroyed. Swans, in great numbers, annually visit this island, and geese and ducks abound. Bare of trees except roan and willow. Metallic ore found, iron, copper, lead, and silver. A copper mine was formerly wrought: at present its chief mineral production is limestone and excellent slate. Manufactories of woollen and linen are conducted on a small scale, but the chief occupation is fishing. The island is divided into eight parishes, and contains about 14,000 souls.

A Description of the Shetland Islands, comprising an Account of their Geology, Scenery, Antiquities, and Superstitions, has recently been published by Dr. Hibbert, and will be perused with interest by the geologist, the antiquary, and the general reader. We limit our extracts at present to those objects of general science which he so ably brings forward.

Account of the pursuit and capture of a drove of whales.—I had landed at Mr. Leisk's of Burra Voe in Yell, when a fishing-boat arrived with the intelligence that a drove of Ca'ing whales had entered Yell Sound. Females and boys, on hearing the news, issued from the cottages in every direction, making the hills reverberate with joyful exclamations of the event. The fishermen armed themselves with a rude sort of harpoon, formed from long iron-pointed spits; they hurried to the strand, launched their boats, and at the same time stored the bottom of them with loose stones. Thus was a large fleet of yawls soon collected from various points of the coast, which proceeded towards the entrance of the sound. Some slight irregular ripples among the waves showed the place where a shoal of whales were advancing. They might be seen sporting on the surface of the ocean for at least a quarter of an hour, disappearing and rising again to blow. The main object was to drive them upon the sandy shore of Hamna Voe, and it was soon evident that, with their enemy in their rear, they were taking this direction. Most of the boats were ranged in a semicircular form, being at the distance of about fifty yards from the animals. A few skiffs, however, acted as a force of reserve, keeping at some little distance from the main body, so that they might be in readiness to intercept the whales, should they change their course. The sable herd appeared to follow certain leaders; who, it was soon feared, were inclined to take any other route than that which led to the shallows on which they might ground. Immediately the detached crews rowed with all their might, in order to drive back the fugitives, and, by means of loud cries and large stones thrown into the water, at last succeeded in causing them to resume their previous course. In this temporary diversion from the shore the van of the boats was

thrown into confusion; and it was a highly interesting scene to witness the dexterity with which the Shetlanders handled their oars, and took up a new semicircular position in rear of the whales. Again the cetacea hesitated to proceed into the inlet, and again a reserve of boats intercepted them in their attempt to escape, while a fresh line of attack was assumed by the main body of the pursuers. It was thus that the whales were at length compelled to enter the harbour of Hamna Voe. Then did the air resound with the shouts that were set up by the boatmen, while stones were flung at the terrified animals, in order to force them upon the sandy shore of a small creek; but, before this object could be effected, the whales turned several times, and were as often driven back. None of them, however, were yet struck with the harpoon; for, if they were to feel themselves wounded in deep water, they would at all hazards betake themselves to the open sea. The leaders of the drove soon began to ground, emitting at the same time a faint murmuring cry, as if for relief: the sand at the bottom of the bay was disturbed, and the water was losing its transparency. The shoal of whales which followed increased, as they struck the shore, the muddiness of the bay; they madly rolled about, irresolute from the want of leaders, uncertain of their course, and so intimidated by the shouts of the boatmen, and the stones that were thrown into the water, as to be easily prevented from regaining the ocean. Crowds of natives of each sex, and of all ages, were anxiously collected on the banks of the Voe, hailing with loud acclamations the approach of these visitants from the northern seas; and then began the work of death. Two men, armed with sharp iron spits, rushed breast high into the water, and, seizing each a fin of the nearest whale, bore him unresistingly along to the shallowest part of the shore. One of the deadly foes of this meekest of the inhabitants of the sea deliberately lifted up a fin, and beneath it plunged into the body of the animal the harpoon that he grasped, so as to reach the large vessels of the heart. A long state of insensibility followed, succeeded by the most dreadful convulsions; the victim lashed the water with his tail, and deluged the land for a considerable distance: another death-like pause ensued; throes still fainter and fainter were repeated with shorter intermissions, until at length he lay motionless on the strand. The butchers afterwards set off in a different direction, being joined by other persons assuming the same functions. Female whales, appearing by their hasty and uncertain course to have been wrested from their progeny, and sucklings no less anxiously in quest of those from whose breasts they had received their nutriment, were, by the relentless steel of the harpooner, severally arrested in their pursuit. Numerous whales which had received their death-wound soon lined the bay, while others, at a greater distance, were rolling about among the muddy and crimsoned waves, doubtful whether to flee, and appearing like oxen to wait the return of their slaughterer. Wanton boys and females, in their anxiety to take a share of the massacre, might be observed to rankle with new tortures the gaping wound

that had been made; while, in their blood-thirsty exultation, they appeared to surpass those whose more immediate duty it was to expedite the direful business. At length the sun set upon a bay that seemed one sheet of blood: not a whale was allowed to escape; and the strand was strewn over with carcasses of all sizes, measuring from six to twenty feet, and amounting to not fewer than eighty in number. Several of the natives then went to their homes in order to obtain a short repose; but, as the twilight in this northern latitude was so bright as to give little or no token of the sun's departure, many were unremittingly intent upon securing the profit of their labor, by separating the blubber, which was of the thickness of three or four inches. It was supposed that the best of these whales would yield about a barrel of oil; and it was loosely computed that they were on an average worth from £2 to £3 sterling a piece, the value of the largest being as much as £6.

The division of the profits that accrue from these whales was, from very ancient times, regulated by strict laws, which on the introduction of feudality varied from those of Denmark. 'As soon,' says Mr. Gifford, 'as the whales are got ashore, the bailie of the parish is advertised, who comes to the place, and takes care that none of them are embezzled; and he acquaints the admiral thereof, who forthwith goes there, and holds a court, where the fiscal presents a petition, narrating the number of whales, how and where drove ashore; and that the judge thereof may give judgment thereupon, according to law and the country practice. Whereupon the admiral ordains the whales driven on shore to be divided into three equal parts; one of the parts to belong to the admiral, one part to the salvors, and one-third to the proprietor of the ground on which the whales are driven ashore; and he appoints two honest men, who are judicially sworn, to divide them equally. The minister or vicar claims the tithes of the whole, and commonly gets it; the bailie also claims the heads for his attendance, and, if the admiral finds he has done his duty, the heads are decreed to him, otherwise not.' In consequence, however, of frequent disputes that took place on this tripartite division of the whales, the earl of Morton, who was invested with the droits of admiralty, appears to have compounded with the landed proprietors of Shetland, by agreeing to accept a definite sum for his share of the capture; but his successors have, I believe, relinquished the claim altogether.

Account of the ling fishery at the Haaf.—On the north of the parish of Northmavine the low hilly ridges, formed by the sea into deep fissures or caverns, terminate in a line of ragged coast, agreeably diversified by a long narrow peninsula of green land jutting out far into the Northern Ocean, which is named Feideland, an appellation of true Scandinavian origin, that is explained by Debes in his description of Feroe. He observes that where grass is found so abundant and juicy, that oxen feed thereon both winter and summer, such places are named Feidelands; and it is very remarkable, he adds, that where there are any Feidelands they invariably turn to the north-east and north. Every where the coast is

awfully wild, the peninsula is broken on each side into steep precipices, exhibiting now and then a gaping chasm, through which the sea struggles, while numerous stacks rise from the surface of a turbulent ocean,—the waves beating around them in angry and tumultuous roar. This is a great station for the ling fishery, which commences in the middle of May, and ends on the 12th of August. When any fishermen resort, for the first time, to a convenient place of this kind, they are allowed by the law to build for themselves huts, on any site which may be uncultivated, uncultivated, and at a distance of not more than 100 yards from the high water-mark. These are constructed of rude stones, without any cement, being made no larger than is sufficient to contain a six-oared boat's crew. The men form the roof of thin pieces of wood, on which they lay turf;—they then strew a little straw upon the ground, and snatch from their severe labors a short repose. On the narrow isthmus of low marshy land, that connects the peninsula of Feideland to the mainland, is interspersed, with all the disorder of a gypsy encampment, a number of these savage huts named summer lodges, and in the centre of them is a substantial booth, used by a factor for curing fish. Here I met with excellent accommodation, owing to the kindness of Mr. Hoseason, who had sent from his house at Lochend every refreshment I might need, together with a comfortable bed for the evening. Feideland is a place possessing no little interest; a remarkably busy scene is presented by the numerous crews sailing to the Haaf, or returning from it laden with fish;—some men are busily engaged in weighing the stock of ling, cod, and tusk, as it is brought in to the factors; others in spreading their lines on the rocks to dry, or in cooking victuals for their comrades who may be employed on the haddock grounds, or in brushing, slitting, and salting the fish that are brought to the door of the booth. But to the naturalist, Feideland presents attractions of no mean kind; the numerous rare marine productions that are continually drawn up by the lines of the fishermen, which a small perquisite might induce them to preserve and bring to the shore, would richly repay him for lingering several days in such a station.

I shall now take an opportunity of giving an account of the Ling Fishery, as it is prosecuted at the Haaf.

The Haaf is a name applied to any fishing-ground outside of the coast, where ling, cod, or tusk, may be caught. Not much above a century ago, the fishery for ling and cod was prosecuted much nearer shore than it is now, and fishing places, designated Raiths, were pointed out by certain landmarks called Meiths, so that every one knew his own raith, and any undue encroachment upon it was considered no less illegal and actionable, than if it had been upon a landed enclosure. The fishermen, however, at the present day, find it their interest to seek for ling at a much greater distance, even to the extent of thirty or forty miles. The men employed at the Haaf are from eighteen years of age and upwards. Six tenants join in a boat, their landlords importing for them frames ready modelled and cut out in

Norway, which, when put together, form a yawl of six oars, from eighteen to nineteen feet in keel, and six in beam; it is also furnished with a square sail. On the 25th of May, or on the 1st of June, the fishermen repair to their several stations. They either endeavour, with rod and line, to procure for bait the fry of the coalfish, of the age of twelve months, named pillocks, or they obtain at the ebb mussels and limpets; and then going out to sea, six miles or more, lay their lines for haddocks, and, after obtaining a sufficient supply of these fish, reserve them for bait.

The Feideland Haaf being thirty or forty miles from land, the fishermen endeavour to leave their station in the morning of one day, so as to be enabled to return in the course of the day following. And if, owing to boisterous weather, they have suffered long detention in their lodges, the first boat that is launched induces every weather-bound crew to imitate the example; it is, therefore, no unusual circumstance to see, in a fleet of yawls, all sails set, and all oars plied, nearly at the same instant of time. Each boat, in the first turn that it makes, observes the course of the sun, and then strives to be the first which shall arrive at the fishing station. Some few of the fishermen, during their voyage, superstitiously forbear to mention in any other name than one that is Norse, or in some arbitrary word of their own coinage, substituted for it, various objects, such, for instance, as a knife, a church, the clergyman, the devil, or a cat. When, after a tug of thirty or forty miles, the crew has arrived at the Haaf, they prepare to set their tows, which is the name they designate the lines by that are fitted with ling-hooks. Forty-five or fifty fathoms of tows constitute a bught, and each bught is fitted with from nine to fourteen hooks. It is usual to call twenty bughts a packie, and the whole of the packies that a boat carries is a fleet of tows. Thus, while a boat in the south or east of Shetland carries only two or three packies, a fleet of tows used on the Feideland Haaf amounts to no less than six, these being baited with seldom less than 1200 hooks, provided with three buoys, and extending to a distance of from 5000 to 6000 fathoms.

The depth at which ling are fished for varies from fifty to 100 fathoms. In setting the tows, one man cuts the fish used for bait into pieces, two men bait and set the lines, and the remaining three or four row the boat. They sink at certain distances what they call cappie-stanes, the first that is let down being called the steeth. These keep the tows properly fixed to the ground. When all this labor is finished, which, in moderate weather, requires three or four hours, and when the last buoy has floated, the fishermen rest for nearly two hours, and take their scanty sustenance; but it is lamentable to think that their poverty allows them nothing more than oatmeal bread, and a few gallons of water. Their severe labors have never yet excited the commiseration of the British government; for, owing to the excessive duty on spirits, they can rarely afford to carry with them the smallest supply of whisky. At length one man, by means of the buoy-rope, undertakes to haul up the tows,—another extricates the fish from the hooks, and throws them into a place in the stern named the shot,—a third

guts them and deposits their livers and heads in the middle of the boat. Along with the ling that is caught, there is a much less quantity of cod and of the gadus brossme or tusk; these are all valuable acquisitions. Six to ten wet lings are about a hundred weight, and hence six or seven score of fish are reckoned a decent haul,—fifteen or sixteen a very good one,—twenty scores of ling are rarely caught, but in such a case garbage, heads, and small fish, are all thrown overboard, nor can these lighten the boat so much as that she will not appear, according to the phrase of the fishermen, just lippering with the water. The skate and halibut which may be taken are reserved to supply the tables of the fishermen. That formidable looking fish the stone-biter (*anarichus lupus*) is also esteemed good eating. When all the tows are heaved up, they are deposited in the bow of the boat. If the weather be moderate, a crew does not need to be detained at the Feideland Haaaf more than a day and a half. But too often a gale comes on,—the men are reluctant to cut their lines, and the most dreadful consequences ensue. About two years ago Mr. Watson, the respectable minister of Northmavine, communicated to the editor of an Edinburgh paper a striking instance of the misfortunes to which the fishermen are liable. In speaking of a number of boats that went off to the Haaaf, he remarked that, ‘about the time they were laying their lines, it blew strong from the south-east, so that it was with much difficulty they could haul them in again. The storm increased and blew off land; two boats particularly were in great distress; they having lost their sails, and being quite worn out with fatigue, were able to do very little for their own safety. Luckily, the wind shifted to the westward, and on the third day the crews all reached land, completely exhausted with hunger and labor, having had nothing but a very little bread and some water. Two of the men, one in each of the boats which suffered most, died before they came to land, and the rest were not able to walk to their houses without assistance.’

Account of the Isle of Stenness, the Holes of Scraada, and the Grind of the Naair.—The Isle of Stenness, and the Skerry of Eshaness, appear at a short distance exposed to the uncontrolled fury of the Western Ocean. The isle presents a scene of unequalled desolation. In stormy winters huge blocks of stones are overturned, or are removed far from their native beds, and hurried up a slight acclivity to a distance almost incredible. In the winter of 1802 a tabular-shaped mass, eight feet two inches by seven feet, and five feet one inch thick, was dislodged from its bed, and removed to a distance of from eighty to ninety feet. I measured the recent bed from which a block had been carried away the preceding winter (A. D. 1818), and found it to be seventeen feet and a half by seven feet, and the depth two feet eight inches. The removed mass had been borne to a distance of thirty feet, when it was shivered into thirteen or more lesser fragments, some of which were carried still farther, from thirty to 120 feet. A block, nine feet two inches by six feet and a half, and four feet thick, was hurried up the acclivity to a distance of 150

feet. Such is the devastation that has taken place amidst this wreck of nature. Close to the Isle of Stenness is the Skerry of Eshaness, formidably rising from the sea, and showing on its westerly side a steep precipice, against which all the force of the Atlantic seems to have been expended: it affords a refuge for myriads of kittiwakes, whose shrill cries, mingling with the dashing of the waters, wildly accord with the terrific scene that is presented on every side.

The fishing station of Stenness is occupied by the tenants of Messrs. Cheyne, who, from the liberal manner in which they are treated, bear the character of being the best fishermen in the country. About seventy boats are annually employed at the Stenness Haaaf. It is computed that between the middle of May and the 12th of August, when the ling fishery ceases, a boat makes about eighteen trips to the Haaaf. Most of the ling, cod, and tusk that are cured in Northmavine go to Ireland; other markets are found for them by Scottish and English merchants, in Barcelona, Lisbon, Ancona, and Hamburg. The dangers that the boats run at the Haaaf have often suggested the expediency of employing small decked vessels for the fishery. Accordingly, there was an undertaking of this kind set on foot about half a century ago, but it was in every respect ill managed, and failed.

Leaving Eshaness, where may be observed an immense block of granite, not less than three yards in diameter, thrown up by the sea, I pursued my way north, along a high gradually ascending ridge that impends the ocean, which is covered with the finest and softest sward that ever refreshed the tired feet of the traveller, being frequently resorted to by the inhabitants of Northmavine, on a fine Sabbath evening, as a sort of promenade. The verdure that embroiders this proud bank, on which numerous sheep continually feed, pleasingly harmonizes, on a calm day, with the glassy surface of the wide Atlantic; nor is the pleasure less perfect when the smooth coating of so luxuriant a green turf is contrasted with the naked red crags that form the precipice below, whitened with the spray of the breakers which continually dash against them with angry roaring. The rich surface of pasture that thus gradually shelves from the elevated ridge of the coast bears the name of the Villians of Ure;—and well might we apply to this favoured spot of Thule the compliment that has been often paid to some rich vale of England,—‘Fairies joy in its soil.’ After a distance of three miles, this gladdening prospect of fertility is suddenly closed with the harsher features that Hialtland usually wears. Near the mountain lake of Houland, where a burgh, built on a holm close to its shore, displays its mouldering walls, the coast resumes its wild aspect.

A large cavernous aperture, ninety feet wide, shows the commencement of two contiguous immense perforations, named the Holes of Scraada, where, in one of them that runs 250 feet into the land, the sea flows to its utmost extremity. Each has an opening at a distance from the ocean, by which the light of the sun is partially admitted. Farther north other ravages of the ocean are displayed. A mass of rock, the average

dimensions of which may perhaps be rated at twelve or thirteen feet square, and four and a half or five feet in thickness, was first moved from its bed, about fifty years ago, to a distance of thirty feet, and has since been twice turned over. But the most sublime scene is where a mural pile of porphyry, escaping the process of disintegration that is devastating the coast, appears to have been left as a sort of rampart against the inroads of the ocean;—the Atlantic, when provoked by wintry gales, batters against it with all the force of real artillery,—the waves having in their repeated assaults forced for themselves an entrance. This breach, named the Grind of the Navir, is widened every winter by the overwhelming surge, that, finding a passage through it, separates large stones from its side, and forces them to a distance of no less than 180 feet. In two or three spots the fragments which have been detached are brought together in immense heaps, that appear as an accumulation of cubical masses, the product of some quarry.

Account of the Religious Paroxysms of the Shetlanders.—The kirk was remarkably crowded, since there was a sermon to be preached incidental to the administration of the Sacrament; on which occasion I had an opportunity of seeing the convulsion fits to which the religious congregations of Shetland are subject. The introduction of this malady into the country is referred to a date of nearly a century ago, and is attributed to a woman who had been subject to regular paroxysms of epilepsy, one of which occurred during divine service. Among adult females, and children of the male sex, at the tender age of six, fits then became sympathetic. The patient complained, for a considerable time, of a palpitation of the heart; fainting ensued, and a motionless state lasted for more than a hour. But, in the course of time, this malady is said to have undergone a modification such as it exhibits at the present day. The female, whom it had attacked, would suddenly fall down, toss her arms about, writhe her body into various shapes, move her head suddenly from side to side, and, with eyes fixed and staring, send forth the most dismal cries. If the fit had occurred on any occasion of public diversion, she would, as soon as it had ceased, mix with her companions, and continue her amusement as if nothing had happened. Paroxysms of this kind prevailed most during the warm months of summer; and, about fifty years ago, there was scarcely a Sabbath in which they did not occur. Strong passions of the mind, induced by religious enthusiasm, were also the exciting causes of these fits; but, like all such false tokens of divine workings, they were easily counteracted, by producing in patients such opposite states of mind, as arise from a sense of shame: thus they are under the control of any sensible preacher, who will administer to a mind diseased,—who will expose the folly of voluntarily yielding to a sympathy so easily resisted, or of inviting such attacks by affectation. An intelligent and pious minister of Shetland informed me that, being considerably annoyed on his first introduction into the country by these paroxysms, whereby the devotions of the church were much impeded,

he obviated their repetition, by assuring his parishioners that no treatment was more effectual than immersion in cold water, and, as his kirk was fortunately contiguous to a fresh water lake, he gave notice that attendants should be at hand, during divine service, to ensure the proper means of cure. The sequel need scarcely be told. The fear of being carried out of the church and into the water, acted like a charm; not a single Naiad was made, and the worthy minister has, for many years, had reason to boast of one of the best regulated congregations in Shetland. When I attended the kirk of Baliasta, a female shriek, the indication of a convulsion-fit, was heard; the minister (Mr. Ingram of Fetlar) very properly stopped his discourse, until the disturber was removed; and, after advising all those who thought they might be similarly affected, to leave the church, he gave out in the mean time a psalm. The congregation was thus preserved from farther interruption; for, on leaving the kirk, I saw several females writhing and tossing about their arms on the green grass, who durst not, for fear of a censure from the pulpit, exhibit themselves after this manner within the sacred walls of the kirk.

Account of the Teutonic fortress called the Burgh of Mousa.—I passed along the shore of the open bay of Sandwick, which has been the grave of many seamen, who, by mistaking it for Bressay Harbour, have suffered all the horrors of shipwreck upon its exposed shores. In crossing a headland, to the east of the Inlet, a small low island, named Mousa, separated from the Mainland by a narrow strait, first rises to the view: this spot is little diversified with hill and dale; it contains one good house with out-buildings and cottages. But the most conspicuous object that lines its shores is the Burgh of Mousa, a circular building, which, if it did but taper towards its summit, would present no unapt similitude of a modern glass-house. This ancient fortress stands close to the water's edge; by crossing, therefore, in a boat, a narrow channel, little more than half a mile in breadth, we are landed immediately under its walls.

The Burgh of Mousa occupies a circular site of ground, somewhat more than fifty feet in diameter, being constructed of middle sized schistose stones of tolerably uniform magnitude, well laid together, without the intervention of any cement. This very simple round edifice attains the elevation of forty-two feet; it swells out, or bulges from its foundation, and draws smaller as it approaches the top, when it is again cast out from its lesser diameter; which singularity of construction is intended to obviate the possibility of scaling the walls. The door that leads to the open area contained within the structure is a small narrow passage, so low that an entrance is only to be accomplished by crawling upon the hands and knees; and, in creeping through it, the wall appears of the great thickness of fifteen feet, naturally leading to the suspicion of a vacuity within. On arriving at the open circular area included within this mural shell, I found the diameter of the space to be about twenty-one feet. On that part of the wall, within the court, which is nearly opposite to the entrance, the at-

tention is excited by a number of small apertures resembling the holes of a pigeon-house. There are three or four vertical rows of them, having each an unequal proportion of openings, varying from eight to eighteen in number. It was now evident that the mural shell of the structure was hollow, and that it contained chambers, to which these holes imparted a feeble supply of light and air. Beneath the whole, at a little distance from the ground, there is a door that leads to a winding flight of stone steps, of the width of three feet, which communicates with all these apartments: I then discovered that the shell of the Burgh was composed of two concentric walls, each of about four feet and a half to five feet in breadth, and that a space of nearly a similar dimension was devoted to the construction of the inner apartments. In ascending these steps, which wound gradually to the top of the wall, I observed that they communicated at regular intervals with many chambers or galleries, one above another, that went round the building. These were severally of such a height that it was possible to walk within them nearly upright. The roof of the lowest chamber was the floor of the second, and after this manner seven tiers were raised. On reaching the highest step of the flight of stairs, there appeared no reason for supposing that any roof had ever protected the summit of the building, so that the Burgh of Mousa must have been originally nothing more than a circular mural shell, open to the top. The height of the inside wall was thirty-five feet, being seven feet less than that of the outside: this difference was partly owing to the accumulation of stones and earth, which had filled the inner court.

The mode was now evident in which this burgh had been intended to give security to the persons and property of the ancient inhabitants of Shetland against the sudden landing of predatory adventurers. The tiers of apartments contained within the thick walls would afford a shelter to women and children from the missile weapons of assaulters, besides being repositories for grain and other kinds of property, as well as for the stores whereby a long siege might be sustained. The low narrow door within the court, which admits of no entrance but in a creeping posture, might be easily secured at a short notice by large blocks of stone. It has been remarked of the rude forts, similar to these which occur on the shores of Scandinavia, that they were seldom taken by an enemy, unless by surprise, or after a long blockade; that frequently terraces and artificial banks were raised near that side of the wall which was the lowest; and that the besieged were then annoyed with arrows, stones, boiling water, or melted pitch, being thrown into the fort—offensive weapons which they did not neglect to return. The history of the Burgh of Mousa confirms the correctness of this observation; its high walls, bulging out from their foundation, defied any attempt to scale them; for, when they were encompassed by one of the earls of Orkney, he had no hopes of inducing the fortress to surrender but by cutting off all supplies of food, and then waiting the event of a long siege. Altogether the building was well adapted for resist-

ing the attacks of the ancient piratical hordes of these seas, who, from the short summers of northern latitudes, and from the incapability of their vessels to sustain a winter's navigation, durst not allow themselves to be detained on the coast by any tedious operations of assault.

Before quitting the Burgh of Mousa, I endeavoured to explore some of the chambers belonging to it, but owing to the ruined state of the floors the attempt was too hazardous. A lively historian has remarked that in Scandinavia such recesses were often devoted in days of yore to the security of young damsels of distinction, who were never safe, while so many bold warriors were rambling up and down in quest of adventures. It is also surmised that galleries like these, which run winding around the walls, were, from the direction which they took, not unfrequently distinguished by the name of serpents or dragons; and hence the many allegorical romances that were coined concerning princesses of great beauty being guarded by such monsters. It is unlucky, however, for the historical interest of the dragon-fortress of Mousa, that within the dismal serpentine windings of its apartments was confined a damsel past her prime of life, and as well entitled to be 'shrined for her brittleness' as any of the frail heroines of antiquity. In the fourteenth century, when, by the rights of udal succession, there were joint earls of Orkney, dame Margareta, the widowed mother of one of them, listened to the lawless importunity of the gay Brunnus. Harold, her son, became impatient of the family disgrace, and banished from the islands his mother's paramour, as well as the illegitimate offspring that were the fruits of the connexion. But, in the course of a short time, dame Margareta's beauties attracted the notice of a more honorable suitor, who was no other than Harold's partner in the earldom of Orkney and Shetland. Erlend proffered love to the dame, which she returned; but as her son, from some cause, was averse to the nuptials, the parties entered into a tender engagement without his consent, and afterwards fled from his fury with all speed into Mousa. Then must Harold needs follow them, his hostile barks sailing in pursuit as fast as if all the winds of heaven had driven them; and then, anon, fled the dame Margareta and Erlend into the fort, within the dark recesses of which they nestled like two pigeons in a dovecot. The burgh was beset with troops, but so impregnable was its construction that the assaulter found he had no chance of reducing it but by cutting off all supplies of food, and by this means waiting the result of a tedious siege. And now turn we to the gentle pair in the fortress, that we may speak of what pain they must there endure, what cold, what hunger, and what thirst. In such a dog-hole,—'a conjurer's circle gives content above it;—a hawk's mew is a princely palace to it.' But Harold had powerful foes in other places wherewith to contend, and, on this account, he gave heed to the advice of his followers, that Erlend should be retained as a friend and not as an enemy, and that he ought not to despise the new family alliance. A reconciliation took place, and then, with great joy, returned the parties to their several pursuits,

well satisfied with each other. Such is the story chronicled by Torfæus concerning the siege of Moseyaburgum and the loves of dame Margareta and Erlend her last leman.

Method of bloodletting in Shetland.—In Shetland there are several native popular medicines. Scurvy grass, for instance, is used in cutaneous complaints, butter-milk in dropsy, the shells of whelks calcined and pounded for dyspepsia, and a variety of steatite named in the country kleber for excoriations. But the mode of letting blood, known from time immemorial, deserves the most particular notice. When the native chirurgeon is called in, he first bathes the part from which the detraction is to be made with warm water, and then draws forth his cupping machine, which consists of nothing more than the upper part of a ram's horn, perforated at the top, and bound round with a soft piece of cotton or woollen rag. In applying it to the skin he sucks out a little of the included air, takes off the horn, makes upon the surface of the part that has thus been gently raised six or seven slight incisions, again fixes the cupping instrument, freely draws out the air by the re-application of his lips to it, and, either by insinuating his tongue within the perforation or by twisting round it a piece of leather or bladder, prevents the ingress of fresh air. He next uses coarse cloths, wrung out with warm water, to stimulate the flowing of the blood, and when the horn is half filled it leaves the skin and falls down. The same process is repeated several times, until a sufficient depletion has been made. It is worthy of remark that the African negroes, described by Park, have a similar mode of cupping.

SJETLAND, NEW SOUTH, a large tract of uninhabited land to the southward of cape Horn, discovered in 1819 by Mr. William Smith, the master of a British merchant brig, and which revived, in some quarters, the belief of a vast continent within the Antarctic circle. Mr. Smith gave to it the name of South Shetland, on account of its lying nearly in the same degree of south as the Shetland Isles of N. lat. It rather appears that the first discovery of it was made so long ago as the year 1599, by a Dutch navigator of the name of Gherritz. See our article **POLAR REGIONS**.

SHETUCKET, a river of Connecticut, formed by the junction of the Willomantic and Mount Hope rivers, and running into the Thames.

SHEVAGUNGA, a town of the Carnatic, south of India, and district of Little Marawar. The government had, according to the Nair custom, been from time immemorial in the hands of a female, styled the Ranny, till about the middle of the last century, when two brothers named Murdoo, of low birth, usurped the power, as rajahs. They were expelled by the nabob of Arcot, but afterwards, through bribery, restored. Again proving refractory, they were attacked by a British detachment, and defended themselves in the fortress of Callarcoil, five months. It was at length taken by storm, and the usurpers hanged. Of the old Shevagunga family there remained no lineal heir; the place was therefore given to a female, a relation of the late Ranny's, and the tribute continued at the former sum of

50,000 pagodas, value 8s 4d. each. Long. 78° 30' E., lat. 9° 54' N.

SHEVAGUNGA, a town of Hindostan, in the Mysore; twenty-five miles north-west of Bangalore, and thirty-three south-west of Chinna Balabaram.

SHEVOCK, a small river of Scotland, in Aberdeenshire, which joins the Gady near its conflux with the Ury.

SHEW. See **SHUW**.

SHEW BREAD, the loaves of bread which the priest of the week put every Sabbath day upon the golden table in the sanctuary before the Lord, in the temple of the Jews. They were twelve in number, and were offered to God in the name of the twelve tribes of Israel. They were shaped like a brick, were ten palms long and five broad, weighing about eight pounds each. They were unleavened, and made of fine flour by the Levites. The priests set them on the table in two rows, six in a row, and put frankincense upon them to preserve them from moulding. They were changed every Sabbath, and the old ones belonged to the priest upon duty. Of this bread none but the priests might eat, except in cases of necessity. It was called the bread of faces, because, the table of the show bread being almost over against the ark of the covenant, the loaves might be said to be set before the face of God. The original table was carried away to Babylon, but a new one was made for the second temple. It was of wood overlaid with gold. This, with the candlestick and some other spoils, was carried by Titus to Rome.

SHIBBOLETH, Heb. שִׁבּוֹלֶת, i. e. an ear of corn. The word proposed by Jephtha to distinguish the Gileadites from the Ephraimites, as the latter pronounced *sh* like *s*. Hence it is still used metaphorically for the cant criterion, or distinguishing mark of a party.

SHIEL, Loch, a lake of Inverness-shire, in the parish of Ardnamurchan, ten miles long and two broad. It has a small island in it called Finan.

SHIELD, *n. s. & v. a.* Sax. *scylb*. A buckler; a broad piece of defensive armour held on the left arm to ward off blows: defence; a defender: to cover with a shield; to defend.

Out of their cold caves and frozen habitations, into the sweet soil of Europe, they brought with them their usual weeds, fit to shield the cold to which they had been inured. *Spenser.*

Were 't my fitness

To let these hands obey my boiling blood,
They're apt enough to dislocate and tear
Thy flesh and bones: howe'er a woman's shape
Doth shield thee. *Shakspeare. King Lear.*

My lord, I must intreat the time alone.

—God shield I should disturb devotion. *Shakspeare.*

Now put your shields before your hearts, and fight
With hearts more proof than shields. *Id. Coriolanus.*

His ponderous shield,

Ethereal temper, massy, large, and round,
Behind him cast; the broad circumference

Hung on his shoulders like the moon. *Milton.*

The terror of the Trojan field,
The Grecian honour, ornament, and shield,
High on a pile the unconquered chief is placed.

Dryden.

At Auxur's shield he drove, and at the blow
Both shield and arm to ground together go.

Id. Æneid.

Shouts of applause ran ringing through the field,
To see the son the vanquished father shield. *Dryden.*

Hear one that comes to shield his injured honour,
And guard his life with hazard of her own. *Smith.*

The SHIELD was an ancient weapon of defence, in form of a light buckler, borne on the arm to fend off lances, darts, &c. The form of the shield is represented by the escutcheon in coats of arms. The shield was that part of the ancient armour on which the persons of distinction in the field of battle always had their arms painted; and most of the words still used to express the space that holds the arms of families are derived from the Latin name for a shield, *scutum*. The French *escu* and *escussion*, and the English word *escutcheon*, or, as we commonly speak it, *scutcheon*, are evidently from this origin; and the Italian *scudo* signifies both the shield of arms and that used in war. The Latin name *clypeus*, for the same thing, seems also to be derived from the Greek word *κλυπειν*, to engrave; and it had this name from the several figures engraved on it as marks of distinction of the person who wore it. The shield in war, among the Greeks and Romans, was not only useful in the defence of the body, but it was also a token, or badge of honor, to the wearer; and he who returned from battle without it was always reckoned infamous. This honorable piece of armour has always been esteemed the properest place to engrave the signs of dignity of the possessor of it; and hence, when arms came to be painted for families, the heralds always chose to represent them upon a shield, but with several exterior additions and ornaments; as the helmet, supporters, and the rest. The form of the shield has not only been different in various nations, but even the people of the same nation, at different times, have varied its form greatly; and among several people there have been shields of several forms and sizes in use at the same period of time, and suited to different occasions. The most ancient and universal form of shields seems to have been the triangular. This we see instances of in all the monuments and gems of antiquity; our own most ancient monuments show it to have been the most antique shape with us, and the heralds have found it the most convenient, when they had any odd number of figures to represent; as if three, then two in the broad bottom part, and one in the narrow upper end, it held them very well; or, if five, they stood as conveniently, three below, and two above. The other form of a shield, now universally used, is square, rounded, and pointed at the bottom: this is taken from the figure of the Samnite shield used by the Romans, and since copied very generally by the English, French, and Germans. The Spaniards and Portuguese have the like general form of shields, but they are round at the bottom without the point; and the Germans, beside the Samnite shield, have two others, viz. 1. The bulging shield, distinguished by its bulging out at the flanks; and, 2. The indented shield, or shield chancree, which has a number of notches and indentings all round

its sides. The use of the ancient shield of this form was, that the notches served to rest the lance upon, that it might be firm while it gave the thrust; but, this form being less proper for the receiving armorial figures, the two former have been much more used in the heraldry of that nation. Beside this different form, we find the shields also often distinguished by their different positions, some standing erect, and others slanting various ways, and in different degrees; this the heralds express by the word *pendant*, i. e. hanging, they seeming to be hung up not by the centre, but by the right or left corner. The French call these *ecu pendant*, and the common antique triangular ones *ecu ancien*. The Italians call this *scuto pendente*; and the reason given for exhibiting the shield in these figures in heraldry is, that, in the ancient tilts and tournaments they who were to just at these military exercises were obliged to hang up their shields with their armories, or coats of arms on them, out at the windows and balconies of the houses near the place; or upon trees, pavilions, or the barriers of the ground, if the exercise was to be performed in the field. Those who were to fight on foot, according to Columbiere, had their shields hung up by the right corner, and those who were to fight on horseback had their's hung up by the left. This position of the shields in heraldry is called *couche* by some writers, though by the generality *pendant*. It was frequent in all parts of Europe, in arms given between the eleventh and fourteenth centuries; but the hanging by the left corner, as it was the token of the owner's being to fight on horseback, so it was esteemed the most noble situation; and all the pendant shields of the sons of the royal family of Scotland and England, and of our nobility at that time, are thus hanging from the left corner. The hanging from this corner was a token of the owner's being of noble birth, and having fought in the tournaments before; but no sovereign ever had a shield pendant any way, but always erect, as they never formally entered the lists of the tournament. The Italians generally have their shields of arms of an oval form, in imitation of those of the popes and dignified clergy; but their herald, *Petro Sancto*, seems to regret the use of this figure of the shield, as an innovation brought in by the painters and engravers as most convenient for holding the figures, but derogatory to the honor of the possessor, as not representing either antiquity or honors won in war, but rather the honors of some citizen or person of learning. In Flanders, where this author lived, the round and oval shields are in the disrepute he speaks of; but in Italy, beside the popes and dignified prelates, many of the first families of the laity have them. The secular princes, in many other countries, also retain this form of the shield, as the most ancient and truly expressive of the Roman *clypeus*.

SHIELD, in heraldry, the escutcheon or field on which the bearings of coats of arms are placed. See HERALDRY.

SHIELD OF SCIPIO, a silver shield made by order of prince Allucius, and presented by him to Scipio Africanus the younger, as an acknowledgment, and in memory of the unparalleled

virtue and generosity he had experienced from that young Roman. Historians have unnecessarily enlarged on this part of Scipio's biography, by filling the mouths of all parties with the most pompous speeches. We give them no credit for their invention. We believe little was said, but much was felt by all parties, at this virtuous and happy meeting:—this triumph of generous sensibility over self-gratification. We give historians full credit, however, when they assure us that Allucius and the lady's parents had brought an immense sum of money to purchase her ransom. This being nobly refused by Scipio gave birth to the silver shield. Allucius, having no other means to express his gratitude, had a massy silver shield made, upon which the whole transaction was most elegantly and expressively engraved, and presented it to his generous benefactor. But Providence does not always favor even the most virtuous, but in the course of its mysterious events often tries their patience. This shield, which Scipio valued so highly and so justly, was lost with part of the baggage in crossing the Rhone. It lay in that river above 1800 years, till 1665, when some fishermen found it, and it was carried to Louis XIV's cabinet.

SHIELDS, NORTH, a township and sea-port in Tynemouth parish, Northumberland, eight miles east from Newcastle, and 232½ north by west from London, on the north side of the river Tyne. The inhabitants are largely employed in the exportation of coals, and the various trades connected with shipping. This extensive and populous town, a few years since, was little better than a dark alley, with a few dirty fishing huts; but wide and airy streets are now built in every direction. Overlooking the river, to the west, stands a range of neat buildings, called Millburn Place; and to the north Dockway Square commands a fine prospect of the river and county to the south, the houses of which are equal to any in the metropolis; and many elegant detached mansions have recently been erected in the neighbourhood. The church, or chapel of ease, was erected in 1659. In the town are many chapels for dissenters, and a variety of institutions for pleasure, and also for charitable purposes. With the daily increasing population of the town, the trade also keeps pace, and may vie even with that of Newcastle, upwards of 400 vessels being annually laden at this port. Market on Wednesday.

SHIELDS, SOUTH, a market-town, and parish in Chester ward, Durham, situate on the south bank of the Tyne, opposite to North Shields. The inhabitants are chiefly employed in ship-building, and in the glass works, soap works, roperies, and various trades. This place, similarly to North Shields, enjoys all the advantages of trade and commerce, in common with Newcastle, particularly in the coal trade. A great number of trading vessels are built here. The town consists principally of one long, narrow, crooked street, nearly two miles in extent, about the centre of which is an open square, or market-place, enclosed in which is the town-hall. The church has lately been rebuilt at an expense of upwards of £5000. In this town are nume-

rous places of worship for dissenters. Petty sessions are held in the town-house, which is also used as an exchange. This town supports an unusual number of benefit societies, and charity schools. The number of vessels belonging to this port is upwards of 500. At this place was established the first laudable society for the saving of sailors from shipwreck. The church is a curacy. Markets on Wednesday and Saturday. Fairs, 24th of June, and 1st of September.

SHIFT, *v. n.*, *v. a.*, & **SHIFT'ER**, *n. s.* } Saxon *scýptan*, of Gothic *skypta*, to change. To change place or appearance; practise some deceptive art for safety: change; alter; transfer from place to place; dress in fresh clothes: 'to shift off' is to defer; put away: a shift, an expedient; refuge; mean or last resource; fraud; evasion; a woman's under linen: a shifter is one who plays shifts or tricks; shiftless, wanting expedients or means.

Pare saffron between the two St. Mary's days
Or set or go *shift* it that knowest the ways. *Tusser.*

She, redoubling her blows, drave the stranger to no other *shift* than to ward and go back; at that time seeming the image of innocence against violence.

Sidney.

Of themselves, for the most part, they are so cautious and wily-headed, especially being men of so small experience and practice in law matters, that you would wonder whence they borrow such subtleties and sly *shifts*. *Spenser.*

The very custom of seeking so particular aid and relief at the hands of God, doth, by a secret contradiction, withdraw them from endeavouring to help themselves, even by those wicked *shifts*, which they know can never have his allowance whose assistance their prayers seek. *Hooker.*

I *shifted* him away.
And laid good 'scuses on your ecstacy.

Shakespeare. Othello.

As it were to ride day and night, and not to have patience to *shift* me.

Id. Henry IV.

If I get down and do not break my *limbs*,
I'll find a thousand *shifts* to get away.

Id. King John.

All those schoolmen, though they were exceeding witty, yet better teach all their followers to *shift* than to resolve by their distinctions. *Raleigh.*

Neither use they their sails, nor place their oars in order upon the sides; but, carrying the oar loose, *shift* it hither and thither at pleasure. *Id.*

The wisdom of all these latter times, in princes' affairs, is rather fine deliveries, and *shiftings* of dangers and mischiefs, when they are near, than solid and grounded courses to keep them aloof. *Bacon.*

To say, where the notions cannot fully be reconciled, that there wanteth a term, is but a *shift* of ignorance. *Id.*

We cannot *shift*: being in we must go on.

Daniel.

Know ye not Ulysses' *shifts*?

Their swords less danger carry than their gifts.

Denham.

Not any beast of skill, but extreme *shift*,
How to regain my sever'd company.

Compelled me to awake the courteous echo,
To give me answer from her mossy couch. *Milton.*

I was such a *shifter*, that, if truth were known,
Death was half glad when he had got him down. *Id.*

Now *shift* your sails. *Dryden's Æneid.*

Slow to resolve, but in performance quick ;
So true, that he was awkward at a trick ;
For little souls on little *shifts* rely. *Dryden.*

The most beautiful parts must be the most finished,
the colours and words most chosen ; many things in
both, which are not deserving of this care, must be
shifted off, content with vulgar expressions.

Dryden's Dufresnoy.

Men in distress will look to themselves, and leave
their companions to *shift* as well as they can.

L'Estrange.

Nature instructs every creature to *shift* for them-
selves in cases of danger. *Id.*

A fashionable hypocrisy shall be called good
manners, so we make a *shift* somewhat to legitimate
the abuse. *Id.*

If the ideas of our minds constantly change and
shift, in a continual succession, it would be impossi-
ble for a man to think long of any one thing.

Locke.

Struggle and contrive as you will, and lay your
taxes as you please, the traders will *shift it off* from
their own gain. *Id.*

Here you see your commission ; this is your duty,
these are your discouragements : never seek for
shifts and evasions from worldly afflictions : this is
your reward, if you perform it ; this your doom if
you decline it. *South.*

Those little animals provide themselves with
wheat ; but they can make *shift* without it.

Addison.

Vegetables being fixed to the same place, and so
not able to *shift* and seek out after proper matter for
their increment, it was necessary that it should be
brought to them. *Woodward.*

By various illusions of the devil they are prevailed
on to *shift off* the duties, and neglect the conditions,
on which salvation is promised. *Rogers's Sermons.*

For the poor *shiftless* irrationals, it is a prodigious
act of the great Creator's indulgence, that they are
all ready furnished with such clothing.

Derham's Physico Theology.

Since we desire no recompense nor thanks, we
ought to be dismissed, and have leave to *shift* for
ourselves. *Swift.*

Come, assist me, muse obedient,

Let us try some new expedient ;

Shift the scene for half an hour,

Time and place are in thy power. *Id.*

This perfect artifice and accuracy might have been
omitted, and yet they have made *shift* to move up
and down in the water.

More's Antidote against Atheism.

She begs you just would turn you while she *shifts*.

Young.

Our herbals are sufficiently stored with plants, and
we have made a tolerable *shift* to reduce them to
classes. *Baker.*

Then *shifting* his side (as a lawyer knows how),
He pleaded again in behalf of the Eyes :

But what were his arguments few people know,
For the court did not think they were equally wise.

Cowper.

SHIFTERS, on board a man of war, are certain
men who are employed by the cooks to shift and
change the water in which the flesh or fish is
put, and laid for some time, in order to fit it for
the kettle.

SHIFTING OF PLANTS, in horticulture, the
business of removing plants from smaller pots
to larger ones, &c., to give them fresh earth or
mould. It is necessary occasionally, in all plants
in pots, to assist them with larger ones, accord-

ing as the advanced growth of the particular
sorts proceed ; and at the same time to supply
an additional proportion of fresh earth about the
root-fibres of the plants, to promote their growth ;
and sometimes, for the application of fresh com-
post, either in part or wholly.

Some sorts, of a strong free growth, require
shifting once every year or two : others, more
moderate growers, or of more settled growths,
once in two or three years ; and some large grow-
ing kinds, that are advanced to a considerable
size, having been occasionally shifted, in their
increasing growth, from smaller into larger pots
of different proportionable sizes, and some from
large pots into tubs of still larger dimensions,
as large plants of the American aloe, orange,
and lemon-tree kinds, &c. In that advanced
state, they sometimes only need occasional shift-
ing once in three or several years, especially
when the pots or tubs are capacious, containing
a large supply of earth, and are occasionally re-
freshed with some new compost at top, and a
little way down, round the sides about the ex-
treme roots : and in some small slow-growing
plants, as in many of the succulent tribe, shift-
ing them once in two or three years may be suffi-
cient ; other sorts want shifting annually into
larger pots, according as they advance in a free
growth, as the hardy and tender kinds of herba-
ceous and shrubby plants, &c. Some of the
tender annual flower-plants, cultivated in pots,
and forwarded in hot-beds, being planted first
in small pots, want shifting, in their increasing
growth, into larger sizes, once or twice the same
season, as from April to the beginning of June,
when, being shifted finally into the requisite full-
sized pots, they remain during their existence.
But though large grown plants, either of the
shrub or tree kind, as we'l as other plants of
large growths, after being finally stationed in the
fullest-sized large pots and tubs, succeed several
years without shifting, they should in the interval
have the top earth loosened, and down round the
sides to some little depth, removing the loosened
old soil, and filling up the pots, tubs, &c., with
fresh earth, settling it close by a moderate wa-
tering.

The season for occasional shifting plants is
principally the spring and autumn, as from
March to May for the spring shifting ; and from
August to the end of September for the autumn ;
though, in plants that can be removed with the
full balls of earth about the roots, it may be oc-
casionally performed almost at any time ; how-
ever, for any general shifting, the spring and
autumn are the most successful seasons, as the
plants then sooner strike fresh root ; and many
sorts preferably in the spring, by having the be-
nefit of the same growing season, and that of
summer. In performing the business, it is
mostly proper to remove the plants from the
smaller to the larger pots, with the balls of earth
about the roots, either wholly, or some of the
outward old earth, the dry or matted radical
fibres only being carefully trimmed away, so as
not to disturb the principal roots in the bodies
of them, as by this means the plants receive but
little check in their growth by the removal.
Sometimes, when any particular plants, shrubs,

or trees, &c., in their pots, discover by their tops that they are in a declining state, as probably the defect may be either in the root, or the old balls of earth, it may be proper to shake all the earth entirely away, in order to examine the roots, and to trim and dress them as the case may require, replanting them in entire fresh compost or mould.

In preparing for this work, where necessary to give larger pots, &c., it is proper to provide them of suitable sizes, in some regular gradation larger than the old ones, according to the nature and growth of the plants, the whole being placed ready, with a proper quantity of fresh compost earth, in proportion to the number and size of the plants intended to be shifted: then let those plants intended to be removed with balls be taken out of their old pots separately, with the whole balls or clumps of earth about the roots as entire as possible; and when large, or tolerably full, with a knife trim off some of the outward loosest earth, and the extreme fibres of the roots; but when small, and adhering together compactly, the whole may be preserved entire; and in either case, where there are very matted, dry, or decayed fibres surrounding the balls, they should be trimmed as it may seem necessary: in those of a fresh lively growth, the loose straggling parts only should be cut away. The requisite pruning, trimming, or dressing in the heads or tops, should also be given where it may seem proper, according to the state of growth, and the natural habit of the different plants; but many sorts require little or none of this sort of attention. Then having placed some pieces of tile or oyster shell, &c., loosely over the holes at bottom, and laid in a little fresh earth, two, three, or four inches deep, or more, according to the size of the pot, the plant should be set in with its ball of earth, as above, filling up around it with more fresh mould, raising it an inch or two over the top of the ball; and giving directly a moderate watering, to settle the earth close about the ball and roots regularly in every part, in a proper manner: in such cases, where the ball in particular plants appears very compactly hard and binding, it may be proper to loosen it a little, by thrusting a sharp pointed stick down into the earth into different parts, giving it a gentle wrench, to open the earth moderately; or sometimes it may also be proper to trim away some of the old earth on the top and sides, then planting it as above, and filling up round and over the ball with fresh earth, and watering it afterwards. Also, in shifting hardy or tender, shrubby, succulent, or herbaceous plants, when any appear of a sickly, weak, or unhealthy growth, it may be advisable to clear off a considerable part of the outward old earth from the balls about the roots, or, in some cases, to shake it wholly away, that the defects in the growths, occasioned either by faults in the roots or in the earth, may be removed by pruning out any decayed or bad parts of the roots, and replanting them wholly in fresh earth. After shifting a moderate watering will of course be required.

SHIFTING A TACKLE, in sea-language, the act of removing the blocks of a tackle to a greater distance from each other, on the object

to which they are applied, in order to give a greater scope of extent to their purchase. This operation is otherwise called *fleeting*. Shifting the helm denotes the alteration of its position, by pushing it towards the opposite side of the ship. Shifting the voyal signifies changing its position on the capstern, from the right to the left, and vice versa.

SHIGGAION, in ancient Hebrew music, is either the name of a musical instrument, or of a tune whose notes were very much diversified. Psal. vii. title.

SHIITES, a religious sect, or rather a religious political party among the Mahometans, which originated on the death of Mahomet, from the rejection of his son-in-law Ali, and which still divides all his followers in Turkey, Arabia, and Persia. If Christians may presume to decide in a Mahometan controversy, we would say the Shiites have justice on their side. Their opponents are called *Sonnites*.

The name Shiites properly signifies sectaries or adherents in general, but is peculiarly used to denote those of Ali Ebn Abi Taleb; who maintain him to be lawful caliph and imam, and that the supreme authority, both in spirituals and temporals, of right belongs to his descendants. The principal sects of the Shiites are five, which are subdivided into an almost incredible number; so that some understand Mahomet's prophecy of the seventy odd sects, of the Shiites only. Their general opinions are, 1. That the peculiar designation of the imam, and the testimonies of the koran and Mahomet concerning him, are necessary points. 2. That the imams ought necessarily to keep themselves free from light sins as well as more grievous. 3. That every one ought publicly to declare who it is that he adheres to, and from whom he separates himself, by word, deed, and engagement, and that herein there should be no dissimulation. But in this last point some of the Zeidians, a sect so named from Zeid, the son of Ali, surnamed Zein al Abedin, and great grandson of Ali, dissented from the rest of the Shiites. As to other articles, wherein they agreed not, some of them came pretty near to the notions of the Motazalites, others to those of the Moshabehites, and others to those of the Sonnites. Among the latter of these, Mahommed al Baker, another son of Zein al Abedin's, seems to claim a place: for his opinion as to the will of God was, that God willeth something in us, and something from us, and that he willeth from us he has revealed to us; for which reason he thought it preposterous that we should employ our thoughts about those things which God willeth in us, and neglect those which he willeth from us: and, as to God's decree, he held that the way lay in the middle, and that there was neither compulsion nor free liberty. A tenet of the Khattabians, or disciples of one Abu'l Khattâb, is too peculiar to be omitted. These maintained paradise to be no other than the pleasures of this world, and hell-fire to be the pains thereof, and that the world will never decay: which proposition being first laid down, it is no wonder they went farther, and declared it lawful to indulge themselves in drinking wine and whoring, and

to do other things forbidden by the law, and also to omit doing the things commanded by the law. Many of the Shiites have carried their veneration for Ali and his descendants so far that they transgressed all bounds of reason and decency; though some of them are less extravagant than others. The Gholaites, who had their name from their excessive zeal for their imams, were so highly transported therewith that they raised them above the degree of created beings, and attributed divine properties to them; transgressing on either hand, by deifying of mortal men, and by making God corporeal: for one while they liken one of their imams to God, and another while they liken God to a creature. The sects of these are various, and have various appellations in different countries. Abd'allah Ebn Saba (who had been a Jew, and had asserted the same thing of Joshua the son of Nun), was the ringleader of one of them. This man gave the following salutation to Ali, viz. Thou art Thou, i. e. thou art God: and hereupon the Gholaites became divided into several species; some maintaining the same thing, or something like it, of Ali, and others of some of one of his descendants; affirming that he was not dead, but would return again in the clouds, and fill the earth with justice. But, how much soever they disagreed in other things, they unanimously held a metempsychosis, and what they call al Holul, or the descent of God on his creatures; meaning thereby that God is present in every place, and speaks with every tongue, and appears in some individual persons; and hence some of them asserted their imams to be prophets, and at length gods. The Nosairians and the Ishakians taught that spiritual substances appear in grosser bodies; and that the angels and the devil have appeared in this manner. They also assert that God has appeared in the form of certain men; and since, after Mahomet, there has been no man more excellent than Ali, and, after him, his sons have excelled all other men, that God has appeared in their form, spoken with their tongue, and made use of their hands, for which reason, say they, we attribute divinity to them. And, to support these blasphemies, they tell several miraculous things of Ali, as his moving the gates of Khaibar, which they urge as a plain proof that he was endued with a particle of divinity, and with sovereign power, and that he was the person in whose form God appeared, with whose hands he created all things, and with whose tongue he published his commands; and therefore they say he was in being before the creation of heaven and earth. In so impious a manner do they seem to wrest those things which are said in Scripture of Christ, by applying them to Ali. These extravagant fancies of the Shiites, however, in making their imams partakers of the divine nature, and the impiety of some of those imams in laying claim thereto, are so far from being peculiar to this sect, that most of the other Mahometan sects are tainted with the same madness; there being many found among them, and among the Susis especially, who pretend to be nearly related to heaven, and who boast of strange revelations before the credulous people. To this account of the Shiites

of the first ages we shall subjoin a brief mention of the great schism at this day subsisting between the Sonnites and the Shiites, or partisans of Ali, and maintained on either side with implacable hatred and furious zeal. Though the difference arose at first on a political occasion, it has, notwithstanding, been so well improved by additional circumstances, and the spirit of contradiction, that each party detest and anathematise the other as abominable heretics, and farther from the truth than either the Christians or the Jews. The chief points wherein they differ are, 1. That the Shiites reject Abu Becr, Omar, and Othman, the three first caliphs, as usurpers and intruders; whereas the Sonnites acknowledge and respect them as rightful imams. 2. The Shiites prefer Ali to Mahomet, or at least esteem them both equal; but the Sonnites admit neither Ali, nor any of the prophets, to be equal to Mahomet. 3. The Sonnites charge the Shiites with corrupting the koran, and neglecting its precepts; and the Shiites retort the same charge on the Sonnites. 4. The Sonnites receive the Sonna, or book of traditions of their prophet, as of canonical authority; whereas the Shiites reject it as apocryphal and unworthy of credit. And to these disputes, and some others of less moment, is principally owing the antipathy which has long reigned between the Turks, who are Sonnites, and the Persians, who are of the sect of Ali.—Sale's Koran, Introduction.

SHILLER SPAR, in mineralogy, a species of hornblende. See MINERALOGY.

SHILLING, *n. s.* Saxon and Erse *scylling*, Belg. *schelling*. A coin of various value in different times. It is now twelve pence.

Five of these pence made their *shilling*, which they called *scilling*, probably from *scillingus*, which the Romans used for the fourth part of an ounce; and forty-eight of these *scillings* made their pound; and four hundred of these pounds were a legacy for a king's daughter, as appeareth by the last will of king Alfred. Camden's Remains.

The very same *shilling* may at one time pay twenty men in twenty days, and at another rest in the same hands one hundred days. Locke.

Who, with much pains exerting all his sense, Can range aright his *shillings*, pounds, and pence. Young.

SHILLING, an English silver coin, equal to the twentieth part of a pound. Freherus derives the Saxon *scilling*, whence our shilling, from a corruption of *siliqua*; proving the derivation by several texts of law, and, among others, by the twenty-sixth law, *De annuis legatis*. Skinner deduces it from the Saxon *scild*, shield, by reason of the escutcheon of arms thereon. Bishop Hooper derives it from the Arabic *scheele*, signifying a weight; but others, with greater probability, deduce it from the Latin *sciliculus*, which signified a quarter of an ounce, or the forty-eighth part of a Roman pound. In confirmation of this etymology it is alleged that the shilling kept its original signification, and bore the same proportion to the Saxon pound as *sciliculus* did to the Roman and the Greek, being exactly the forty-eighth part of the Saxon pound; a discovery which we owe to Mr. Lambarde. (Explic. Rer. et Verb. Sax. voc. Libra)

However, the Saxon laws reckon the pound in the round number at fifty shillings, but they really coined out of it only forty-eight; the value of the shilling was five-pence; but it was reduced to four-pence above a century before the conquest; for several of the Saxon laws, made in Athelstan's reign, oblige us to take this estimate. Thus it continued to the Norman times, as one of the conqueror's laws sufficiently ascertains; and it seems to have been the common coin by which the English payments were adjusted. After the conquest the French solidus of twelve pence, which was in use among the Normans, was called by the English name of shilling; and the Saxon shilling of fourpence took a Norman name, and was called the groat, or great coin, because it was the largest English coin then known in England. It has been the opinion of the bishops Fleetwood and Gibson, and of the antiquaries in general, that, though the method of reckoning by pounds, marks, and shillings, as well as by pence and farthings, had been in constant use even from the Saxon times, long before the Norman conquest, there never was such a coin in England as either a pound or a mark, nor any shilling, till the year 1504 or 1505, when a few silver shillings or twelve-pences were coined, which have long since been solely confined to the cabinets of collectors. Mr. Clarke combats this opinion, alleging that some coins mentioned by Mr. Folkes, under Edward I., were probably Saxon shillings new minted, and that archbishop Aelfric expressly says (*Gram. Saxon.* p. 52) that the Saxons had three names for their money, viz. mancuses, shillings, and pennies. He also urges the different value of the Saxon shilling at different times, and its uniform proportion to the pound, as an argument that their shilling was a coin; and the testimony of the Saxon gospels, in which the word we have translated pieces of silver is rendered shillings, which, he says, they would hardly have done, if there had been no such coin as a shilling then in use. Accordingly the Saxons expressed their shilling in Latin by *siclus* and *argenteus*. He farther adds that the Saxon shilling was never expressed by *solidus* till after the Norman settlements in England; and, howsoever it altered during the long period that elapsed from the conquest to the time of Henry VII., it was the most constant denomination of money in all payments, though it was then only a species of account, or the twentieth part of the pound sterling: and when it was again revived as a coin, it lessened gradually as the pound sterling lessened, from the twenty-eighth of Edward III. to the forty-third of Elizabeth. In 1560 there was a peculiar sort of shilling struck in Ireland, of the value of ninepence English, which passed in Ireland for the value of twelpence. The motto on the reverse was *posui Deum adiutorem meum*. Of these shillings, according to Malynes, eighty-two went to the pound; they therefore weighed twenty grains one-fourth each, which is somewhat heavier in proportion than the English shilling of that time, sixty-two whereof went to the pound, each weighing ninety-two grains seven-eighths; and the Irish shilling being valued at the tower at ninepence English, that is, one-fourth

part less than the English shilling, it should therefore proportionably weigh one-fourth part less, and its full weight be somewhat more than sixty-two grains; but some of them found at this time, though much worn, weighed sixty-nine grains. In 1598 five different pieces of money of this kind were struck in England, for the service of the kingdom of Ireland at twelpence each; half shillings to be current at sixpence, and quarter shillings at threepence. Pennies and halfpennies were also struck of the same kind, and sent over for the payment of the army in Ireland. The money thus coined was of a very base mixture of copper and silver; and two years after there were more pieces of the same kind struck for the same service, which were still worse; the former being three ounces of silver to nine ounces of copper; and these latter only two ounces eighteen pennyweights to nine ounces two pennyweights of the alloy. The Dutch, Flemish, and Germans have likewise their shilling, called *schelin*, *schilling*, *scalin*, &c., but these, not being of the same weight or fineness with the English shilling, are not current at the same value. The English shilling is worth about twenty-three French sols; those of Holland and Germany about eleven sols and a half; those of Flanders about nine. The Dutch shillings are also called *sols de gros*, because equal to twelve gros. The Danes have copper shillings worth about one-fourth of a farthing sterling.

SHILL-I-SHALL-I. A corrupt reduplication of 'shall I?' The question of a man hesitating. To stand *shill-I-shall-I* is to continue hesitating and procrastinating.

I am somewhat dainty in making a resolution, because, when I make it, I keep it: I don't stand *shill-I-shall-I* then: if I say 't, I'll do 't.

Congreve's Way of the World.

SHILOH, a town of Africa, on the banks of the Bahr el Abiad, or true Nile. The houses are built of clay, and the inhabitants are idolaters, have no other clothing than bands of long grass, which they pass round the waist and between the thighs. They are all black; both sexes are accustomed to shave their heads. The people of Shiluk have the dominion of the river, and take toll of all passengers, in such articles of traffic as pass among them. They are hospitable to such as come among them in a peaceable manner, and never betray those to whom they have once accorded protection. Long. 32° 26' E., lat. 130° 0' N..

SHILOH, a term much disputed among interpreters and commentators upon Scripture. In Gen. xlix. 10 it denotes the Messiah. The patriarch Jacob foretels his coming in these words: 'the sceptre shall not depart from Judah, nor a lawgiver from between his feet, until Shiloh come: and unto him shall the gathering of the people be.' The Hebrew text reads **עַרְבֵי יוֹכָן שִׁלֹּה** until Shiloh come. All Christian commentators agree that this word ought to be understood of the Messiah, or Jesus Christ; but all are not agreed about its literal and grammatical signification. St. Jerome, who translates it by *Qui mittendus est*, manifestly reads Shiloach, sent, instead of Shiloh. The Septuagint have it

ἕως ἂν ἐλθῇ τὰ ἀποκεκρυμένα αὐτῷ; or, ἕως ἂν ἐλθῇ ὡς ἀποκείται (as if they had read שֶׁל instead of שָׁלָה), i. e. 'Until the coming of him for whom it is reserved;' or, 'till we see arrive that which is reserved for him.' Some translate, 'the sceptre shall not depart from Judah till he comes to whom it belongs;' שָׁלָה or שָׁלִי instead of לִי אֶלֶן. Others, 'till the coming of the peace-maker;' or, 'the pacific;' or, 'of prosperity,' שָׁלָה prosperatus est. Shalah signifies 'to be in peace, to be in prosperity;' others, 'till the birth of him who shall be born of a woman that shall conceive without the knowledge of a man,' שָׁלִי or שָׁלִיָּה, secundina, fluxus. Le Clerc explains it, 'the sceptre shall not depart from Judah, till its end, its ruin; till the downfall of the kingdom of the Jews,' שָׁאָל or שָׁלָה it has ceased, it has finished. But this explains nothing. It is only saying, the sceptre shall not depart till it depart! A more modern author derives Shiloh from שָׁלָה, fatigare, which sometimes signifies to be weary, to suffer; 'till his labors, his sufferings, his passion, shall happen.' But, whatever be the precise grammatical signification of Shiloh, it is sufficient for us to show that the ancient Jews are in this matter agreed with the Christians; they acknowledge that this word stands for the Messiah, the King. It is thus that the paraphrasts Onkelos and Jonathan, that the ancient Hebrew commentaries upon Genesis, and that the Talmudists themselves explain it. If Jesus Christ and his apostles did not make use of this passage to prove the coming of the Messiah, it was because then the completion of this prophecy was not sufficiently manifest. The sceptre still continued among the Jews; they seemed to have still kings of their own nation, though the royal family was extirpated by Herod; but soon after the sceptre was entirely taken away from them, and has never been restored to them since. But that Jacob's prophecy was literally fulfilled is clear from the whole history of the Jews. Nothing is more evident than that the posterity of Judah preserved their distinct existence as a tribe, or rather as a nation, together with a power of government and legislation, even when they were occasionally subject to other nations, till Jesus Christ was born into the world. The tribe of Judah was the most numerous of the twelve when they came out of Egypt: under Moses they led the van in the wilderness: after leaving it they were divinely ordered to make the first attack on the remaining Canaanites (Judges, i. 1, 2), as well as afterwards against the Benjamites (xx. 18). Caleb, and his son-in-law Othniel, the first judge of Israel after Joshua, were of this tribe: and, from the death of Saul, the royal house of David held the supreme power till the Babylonish captivity. Even under the Chaldeans, Medes and Persians, Jeconiah, Zerubbabel, and Nehemiah, who were all of this tribe, held an evident superiority over the Jews. (See 2 Kings xxv. Ezra, i—vi. Neh. i—xiii.) And for a period of about 450 years, from the death of Zerubbabel to the usurpation of Herod, the government of Judah continued in the descen-

dants of Zerubbabel, and afterwards in the Asmonean, or Maccabean family; till the usurpation of Herod the Ascalonite or Idumean, a few years before the birth of our Saviour, showed that the completion of the prophecy by the coming of Shiloh, and the departure of the sceptre from Judah, was about to take place. See HEROD, and the chronological series of the princes of Judah, under JUDAH. The total conquest and dispersion of the Jews soon after, and the dreadful destruction of Jerusalem by the Romans, completely fulfilled the prophecies of Jacob and our Saviour. See JEWS.

SHILOH, in ancient geography, a celebrated city of Israel, in the tribe of Ephraim, about ten miles south of Shechem, and twenty-five north of Jerusalem. In this city Joshua divided the Western Canaan among the nine tribes and a half (Josh. xviii.); and here he fixed the Tabernacle of God; where it remained for about 350 years, till it was taken by the Philistines, little to their advantage. Here too the remaining 200 Benjamites provided themselves with wives at the vintage festival (Judges xxi. 23.); as the Romans afterwards did with the Sabine virgins.

SHIM, in agriculture, a tool of the tillage kind, used in breaking down and reducing the more stiff and heavy sorts of land, as well as cutting up and clearing them from weeds. In the Hertford Agricultural Survey by the Board of Agriculture, the writer remarks that a tool of this kind is in use by Mr. Calvert, which differs from those usually employed, in which the cutting-iron or plate, which for the work it is adapted for, as that of cutting up weeds on two-bout or four-furrow Essex ridges, or of cleaning land without ploughing or burying the soil, is a small segment of a large circle. It despatches a ridge at a time, and is an implement that performs its business well, and which deserves the notice of the tillage-farmer in other places. It is readily altered for flat work, and is said to be had recourse to by other farmers with success in the same district. A useful tool of this sort has also been recommended by Mr. Young, in his Annals, the hint of which he took from the Berkshire one, and to which the beam and block is capable of being applied. In a wide interval, the three shares may be worked on a level. Between the rows of cabbages, after earthing up, the two external shares may be set to cut the weeds that are apt to rise on the sides of the ridges, without disturbing too much earth, and the centre share sunk to scrape the bottom of the furrow. The centre one may also be worked alone, between narrow rows. In forging the shares of all shims, he has well observed that the blacksmith should be careful to give them tendency enough into the ground, by bending them downwards: for want of this caution, he has found many of them to work badly. The wheel in the beam counteracts this tendency sufficiently when at work. These tools should be upon all tillage farms.

SHIM, POTATOE, a tool of the shim kind, used for cleaning the potatoe crops.

SHIN, *n. s.* Saxon *scina*; Teut. *schien*. The forepart of the leg.

I bruised my *shin* the other day with playing at sword and dagger.

Shakespeare. Merry Wives of Windsor.

The *shin* bone, from the knee to the instep, is made by shadowing one half of the leg with a single shadow.

Peucham.

His leg then broke,

Had got a deputy of oak;

For when a *shin* in fight is cropt,

The knee with one of timber's propt. *Hudibras.*

As when to an house we come,

To know if any one's at home,

We knock; so oue must kick your *shin*,

Ere he can find your soul's within. *Anonymous.*

SHINAR, a province of Babylonia, where the famous tower of Babel was built. See BABEL. It had mountains named Zagræi, and a city and river named Singara. Ashur the son of Shem emigrated out of it.

SHINE, *v. n. & n. s.* } *Pret.* I shone, I have

SHIN'Y, *adj.* } shone; sometimes I shined, I have shined. *Sax. fcinan; Belg. schijnen.* To have bright resplendence; to glitter; glisten; gleam; fair weather: the adjective corresponding.

They are waxen fat, they *shine*. *Jer. v. 28.*

The Lord make his face *shine* upon thee, and be gracious. *Numbers vi. 25.*

The light of righteousness hath not *shined* unto us, and the sun of righteousness rose not upon us.

Wisdom v. 6.

So proud she *shined* in her princely state,

Looking to heaven, for earth she did disdain,

And sitting high. *Faerie Queene.*

When Aldeboran was mounted high,

Above the *shiny* Cassiopeia's chair,

One knocked at the door, and in would fare. *Id.*

To-day the French,

All clinquant, all in gold, like heathen gods,

Shone down the English; and to-morrow

Made Britain India: every man that stood

Shewed like a mine. *Shakespeare*

The moon *shines* bright: in such a night as this,

When the sweet wind did gently kiss the trees,

And they did make no noise.

Id. Merchant of Venice.

How bright and goodly *shines* the moon!

—The moon! the sun: it is not moonlight now.

Shakespeare.

The night

Is *shiny*, and they say we shall embattle

By th' second hour o' th' morn.

Id. Antony and Cleopatra.

Clear pools greatly comfort the eyes, when the sun is overcast, or when the moon *shineth*. *Bacon.*

He that has injured his eyes to that divine splendour which results from the beauty of holiness is not dazzled with the glittering *shine* of gold, and considers it as a vein of the same earth he treads on.

Decay of Piety.

Fair daughter, blow away these mists and clouds, And let thy eyes *shine* forth in their full lustre.

Denham.

True paradise inclosed with *shining* rock. *Milton.*

We can dismiss thee ere the morning *shine*. *Id.*

Fish with their fins and *shining* scales. *Id.*

Her face was veiled; yet to my fancied sight

Love, sweetness, goodness, in her person *shined*

So clear, as in no face with more delight. *Id.*

Celestial light

Shine inward, and the mind through all her powers

Irradiate. *Id.*

Be it fair or foul, or rain or *shine*. *Dryden.*

While from afar we heard the cannons play,

Like distant thunder on a *shiny* day,

For absent friends we were ashamed to fear. *Id.*

The sun *shines* when he sees it. *Locke.*

The colour and *shining* of bodies is nothing but the different arrangement and refraction of their minute parts. *Id.*

Cato's soul

Shines out in every thing she acts or speaks;

While winning mildness and attractive smiles

Dwell in her looks, and with becoming grace

Softens the rigour of her father's virtues. *Addison.*

The reformation, in its first establishment, produced its proper fruits, and distinguished the whole age with *shining* instances of virtue and morality.

Id. Freeholder.

Of all the enamelled race, whose silvery wing

Waves to the tepid zephyrs of the spring,

Or swims along the fluid atmosphere,

Once brightest *shined* this child of heat and air.

Pope.

Say, in what mortal soil thou deignest to grow?

Fair opening to some court's propitious *shine*,

Or deep with diamonds in the flaming mine? *Id.*

Few are qualified to *shine* in company; but it is in most men's power to be agreeable. *Swift.*

SHIN'NESS, *n. s.* From SHY. Unwillingness to be tractable or familiar.

An incurable *shinness* is the vice of Irish horses, and is hardly ever seen in Flanders, because the winter forces the breeders there to house and handle their colts.

Temple.

They were famous for their justice in commerce, but extreme *shinness* to strangers: they exposed their goods with the price marked upon them, and then retired.

Arbuthnot.

SHIN'GLE, *n. s.* Teut. *schindel*. A thin board to cover houses.

The best to cleave is the most useful for pales, laths, *shingles*, and wainscot.

Mortimer's Husbandry.

SHINGLES, in building, are small pieces of wood, or quartered oaken boards, sawn to a certain scantling, or, as is more usual, cleft to about an inch thick at one end, and made like wedges, four or five inches broad, and eight or nine long. They are used instead of tiles or slates, especially for churches and steeples; however, this covering is dear; yet, where tiles are very scarce, and a light covering is required, it is preferable to thatch; and, where they are made of good oak, cleft, and not sawed, and well seasoned in water and the sun, they make a sure, light, and durable covering. The building is first to be covered all over with boards, and the shingles nailed upon them.

SHIP, *n. s. & v. a.*

SHIPBOARD,

SHIPBOY,

SHIPMAN,

SHIPMASTER,

SHIPPING,

SHIPWRECK, *n. s. & v. n.*

SHIPWRIGHT, *n. s.*

Sax. fcep; Belg.

schip. A large hol-

low vessel made to

pass on or over the

seas: to put into a

ship: the deriva-

tives correspond-

ing.

Hiram sent in the navy *shipmen* that had knowledge of the sea. *1 Kings ix. 27.*

They have made all thy *shipboards* of fir-trees, and brought cedars from Lebanon to make masts.

Ezek. xxvii. 5.

The *shipmaster* came to him, and said unto him, What meanest thou, O sleeper? arise, call upon thy God *Jonah i. 6.*

They took *shipping* and came to Capernaum, seeking for Jesus. *John vi. 24.*

Holding faith and a good conscience, which some having put away, concerning faith, have made *shipwreck*. *1 Timothy 1.*

Two other *ships* loaded with victuals were burnt, and some of the men saved by their shipboats. *Knolles.*

The emperor, *shipping* his great ordnance, departed down the river. *Id. History of the Turks.*

All my followers to the eager foe
Turn back, and fly like *ships* before the wind.

Shakspeare. Henry VI.

My father at the road
Expects my coming, there to see me *shipped*.

Shakspeare.

I myself have the very points they blow,

All the quarters that they know

I' th' *shipman's* card. *Id. Macbeth.*

Few or none know me: if they did,
This *shipboy's* semblance hath disguised me quite.

Shakspeare.

Whence the sun 'gins his reflection,
Shipwrecking storms and direful thunders break. *Id.*

Why such impress of *shipwrights*, whose sore task
Does not divide the Sunday from the week? *Id.*

Before Cæsar's invasion of this land, the Britons had not any *shipping* at all, other than their boats of twigs covered with hides. *Raleigh.*

'There made forth to us a small boat, with about eight persons in it, whereof one of them had in his hand a tipstaff, who made aboard our *ship*. *Bacon.*

Let him go on *shipboard*, and the mariners will not leave their starboard and larboard. *Bramhall.*

Instead of a *ship*, he should levy upon his country such a sum of money, and return the same to the treasurer of the navy: hence that tax had the denomination of *ship-money*, by which accrued the yearly sum of two hundred thousand pounds.

Clarendon.

Friend,
What dost thou make a *shipboard*? To what end?

Dryden.

A breeze from shore began to blow,
The sailors *ship* their oars, and cease to row;
Then hoist their yards a-trip, and all their sails
Let fall. *Id.*

Fishes first to *shipping* did impart;
Their tail the rudder, and their head the prow. *Id.*

Nor is indeed that man less mad than these,

Who freights a *ship* to venture on the seas,

With one frail interposing plank to save

From certain death, rolled on by every wave. *Id.*

They might have it in their own country, and that by gathering up the *shipwrecks* of the Athenian and Roman theatres. *Id.*

We are not to quarrel with the water for inundations and *shipwrecks*. *L'Estrange.*

Bold were the men, who on the ocean first
Spread their new sails, when *shipwreck* was the worst.

Waller.

In Portugal men spent with age, so as they cannot hope for above a year, *ship* themselves away in a Brazil fleet. *Temple.*

The numbers and courage of our men, with the strength of our *shipping*, have for many ages past made us a match for the greatest of our neighbours at land, and an overmatch for the strongest at sea.

Id.

A *ship* carpenter of old Rome could not have talked more judiciously. *Addison.*

The canal that runs from the sea into the Arno, gives a convenient carriage to all goods that are to be *shipped off*. *Id.*

A square piece of marble shews itself to have been a little pagan monument of two persons who were *shipwrecked*. *Id.*

Thou that canst still the raging of the seas,
Chain up the winds, and bid the tempests cease,
Redeem my *shipwrecked* soul from raging gusts
Of cruel passion and deceitful lusts. *Prior.*

This sea war cost the Carthaginians five hundred quinquiremes, and the Romans seven hundred, including their *shipwrecks*. *Arbuthnot.*

The Roman fleet, although built by *shipwrights*, and conducted by pilots, both without experience, defeated that of the Carthaginians. *Id.*

A single leaf can waft an army o'er,
Or *ship off* senates to some distant shore. *Pope.*

As when a *shipwright* stands his workmen o'er,

Who ply the wimble some huge beam to bore,

Urged on all hands it nimbly spins about,

The grain deep piercing, till it scoops it out. *Id.*

Vast numbers of ships, in our harbours, and *shipwrights* in our sea-port towns. *Sieff.*

It curbs their impetuosity; puts the reins into the hands of reason; quells the rising storm ere it make *shipwreck* of the conscience; and teaches a man to leave off contention before it be meddled with.

Mason.

SHIP is a general name for all large vessels, particularly those equipped with three masts and a bowsprit; the masts being composed of a lower-mast, top-mast, and top-gallant mast; each of these being provided with yards, sails, &c. Ships, in general, are either employed for war or merchandise.

SHIP, HOSPITAL, a vessel fitted up to attend on a fleet of men of war, and receive their sick or wounded; for which purpose her decks should be high, and her ports sufficiently large. Her cables ought also to run upon the upper deck, to the end that the beds or cradles may be more commodiously placed between decks, and admit a free passage of the air to disperse that which is offensive or corrupted.

SHIP, MERCHANT, a vessel employed in commerce to carry commodities of various sorts from one port to another. The largest merchant-ships are those employed by the different companies of merchants who trade to the East Indies. They are, in general, larger than our forty-gun ships; and are commonly mounted with twenty guns on their upper deck, which are nine pounders; and six on their quarter-deck, which are six pounders.

SHIP'S FORM GAUGE, an instrument that has been recommended as fit to ascertain any alteration in the bottom of a ship, by its hogging or sagging; and also to regulate the stowage of a ship. 'All ships,' says Mr. Hutchinson, 'of any consequence are built with staunchions fixed from the keelson to the middle of all the lower-deck beams fore and aft, in order to support them in their exact, regular height, as well as the whole frame of the ship in the regular form in which she was built upon the stocks; yet, notwithstanding these staunchions, it is proved from experience that our ships' bottoms, hitherto, by the pressure of water and improper stowage, have generally been hogged upwards, or sagged downwards, and most about the midship frame or main body of the ship, which is commonly about the fore part of the main hatchway; which naturally makes it the best place at which to fix the ship's form gauge, where either the hogging or

sagging of her bottom may be observed and seen soonest and best, to regulate the stowage of heavy materials to the greatest advantage, so as to keep her bottom nearly in the same form in which she was built. The gauge I recommend is nothing more than a narrow plate of iron divided into inches and quarters like the side of a carpenter's rule. Let this be fixed to the after side of the staunchion now mentioned, with its upper end projecting two or three inches above the staunchion; a groove being cut out for it in the after side of the lower-deck beam, and a mark being made (when the ship is on the stocks) at the part of the beam which corresponds to the 0 on the gauge. When the ship alters in her shape the gauge will slide up and down in this groove, and the quantity of hogging or sagging will be pointed out on the gauge by the mark on the beam. The stowage may then be so managed as to bring this mark to coincide again with the 0, or to approach it as near as we see necessary.

SHIPS, MANAGEMENT OF, AT SINGLE ANCHOR, is the method of taking care of a ship while riding at single anchor in a tide-way, by preventing her from fouling her anchor, &c. The following rules for this purpose are given by the ingenious Mr. Henry Taylor of North Shields, and will be found of consequence:—Riding in a tideway, with a fresh-of-wind, the ship should have what is called a short or windward service, say forty-five or fifty fathoms of cable, and always with the helm hard down, but more or less so according to the strength or weakness of the tide. It is a known fact that many ships sheer their anchors home, drive on board of other ships, and on the sands near which they rode, before it has been discovered that the anchor had been moved from the place where it was let go. When the wind is cross, or nearly cross, off shore, or in the opposite direction, ships will always back. This is done by the mizen-top-sail, assisted, if needful, by the mizen-stay-sail; such as have no mizen-top-sail commonly use the main-top-sail, or if it blows fresh, a top-gallant-sail, or any such sail at the gaff. In backing, a ship should always wind with a taught cable, that it may be certain the anchor is drawn round. In case there is not a sufficiency of wind for that purpose, the ship should be hove apeak. Riding with the wind afore the beam, the yards should be braced forward; if abaft the beam they are to be braced all a-back. If the wind is so far aft that the ship will not back (which should not be attempted if, when the tide ceases, the ship forges ahead and brings the buoy on the lee-quarter), she must be set a-head: if the wind is far aft, and blows fresh, the utmost care and attention are necessary, as ships riding in this situation often break their sheer, and come to windward of their anchors again. When the ship lies in this ticklish situation, the after-yards must be braced forward, and the fore-yards the contrary way: she will lie safe, as the buoy can be kept on the lee-quarter, or, suppose the helm is a-port, as long as the buoy is on the larboard quarter. With the helm thus, and the wind right aft, or nearly so, the starboard, main, and fore braces should be hauled in. This supposes the main braces to lead forward. When the ship begins to tend to

leeward, and the buoy comes on the weather-quarter, the first thing to be done is to brace about the fore-yard; and, when the wind comes near the beam, set the fore-stay-sail, and keep it standing until it shakes; then brace all the yards sharp forward, especially if it is likely to blow strong. If lying in the aforesaid position, and she breaks her sheer, brace about the main yard immediately; if she recovers and brings the buoy on the lee or larboard quarter, let the main-yard be again braced about; but if she come to a sheer the other way, by bringing the buoy on the other quarter, change the helm and brace the fore-yard to. Riding leeward tide with more cable than the windward service, and expecting the ship will go to windward of her anchor, begin as soon as the tide ceases to shorten in the cable. This is often hard work; but it is necessary to be done, otherwise the anchor may be fouled by the great length of cable the ship has to draw round; but, even if that could be done, the cable would be damaged against the bows or cut-water. It is to be observed that, when a ship rides windward tide, the cable should be cackled from the short service towards the anchor, as far as will prevent the bare part touching the ship. When the ship tends to windward, and must be set a-head, hoist the fore staysail as soon as it will stand, and, when the buoy comes on the lee-quarter, haul down the fore-stay-sail, brace to the fore-yard, and put the helm a-lee; for till then the helm must be kept a-weather and the yards full. When the ship rides leeward tide, and the wind increases, care should be taken to give her more cable in time, otherwise the anchor may start, and probably it will be troublesome to get her brought up again; and this care is the more necessary when the ship rides in the hause of another ship. Previous to giving a long service it is usual to take a weather-bit, that is, a turn of the cable over the windlass end, so that in veering away the ship will be under command. The service ought to be greased, which will prevent its chafing in the hause. If the gale continues to increase, the topmasts should be struck in time; but the fore-yard should seldom, if ever, be lowered down, that in case of parting the foresail may be ready to be set. At such times there should be more on deck than the common anchor-watch, that no accident may happen from inattention or falling asleep. In a tide-way, a second anchor should never be let go but when absolutely necessary; for a ship will sometimes ride easier and safer, especially if the sea runs high, with a very long scope of cable and one anchor, than with less length and two cables; however, it is advisable, as a preventive, when ships have not room to drive, and the night is dark, to let fall a second anchor under foot, with a range of cable along the deck. If this is not thought necessary to be done, the deep sea lead should be thrown overboard, and the line frequently handled by the watch, that they may be assured she rides fast. If at any time the anchor watch, presuming on their own knowledge, should wind the ship, or suffer her to break her sheer without calling the mate, he should immediately, on the very first opportunity, oblige the crew to heave the anchor in sight, which will prevent the commission of

the like fault again; for, besides the share of trouble the watch will have, the rest of the crew will blame them for neglecting their duty. Prudent mates seldom lie a week in a roadstead without heaving their anchor in sight; even though they have not the least suspicion of its being foul. There are other reasons why the anchor should be looked at; sometimes the cable receives damage by sweeping wrecks or anchors that have been lost, or from rocks or stones; and it is often necessary to trip the anchor, in order to take a clearer birth, which should be done as often as any ship brings up too near.

Method for the safe removal of ships when driven on shore.—For this purpose empty casks are usually employed to float off the vessel, especially if she is small, and at the same time near the port to which it is proposed to conduct her. In other cases, the following method adopted by Mr. Barnard will answer. 'On January 1st, 1777,' says Mr. Barnard (Philosophical Transactions, vol. lxx., part. 1), in a most dreadful storm, the York East Indiaman, of 800 tons, homeward bound, with a pepper cargo, parted her cables in Margate roads, and was driven on shore, within 100 feet of the head and thirty feet of the side of Margate pier, then drawing twenty-two feet six inches water, the flow of a good spring tide being only four feet at that place. On the 3d, I went down, as a ship-builder, to assist, as much as lay in my power, my worthy friend Sir Richard Hotham, to whom the ship belonged. I found her perfectly upright, and her shere (or appearance) the same as when first built, but sunk to the twelve feet water mark fore and aft in a bed of chalk mixed with a stiff blue clay, exactly the shape of her body below that draft of water: and from the rudder being torn from her as she struck coming on shore, and the violent agitation of the sea after her being there, her stern was so greatly injured as to admit free access thereto, which filled her four days equal to the flow of the tide. Having fully informed myself of her situation and the flow of spring-tides, and being clearly of opinion she might be again got off, I recommended, as the first necessary step, the immediate discharge of the cargo: and, in the progress of that business, I found the tide always flowed to the same height on the ship; and when the cargo was half discharged, and I knew the remaining part should not make her draw more than eighteen feet water, and while I was observing the water at twenty-two feet six inches by the ship's marks, she instantly lifted to seventeen feet eight inches; the water and air being before excluded by her pressure on the clay, and the atmosphere acting upon her upper part equal to 600 tons, which is the weight of water displaced at the difference of these two drafts of water. The moment the ship lifted, I discovered she had received more damage than was at first apprehended, her leaks being such as filled her from four to eighteen feet water in an hour and a half. As nothing effectual was to be expected from pumping, several

scuttles or holes in the ship's side were made, and the valves fixed thereto to draw off the water at the lowest ebb of the tide, to facilitate the discharge of the remaining part of the cargo; and, after many attempts, I succeeded in an external application of sheep skins, sewed on a sail and thrust under the bottom, to stop the body of water from rushing so furiously into the ship. This business effected, moderate pumping enabled us to keep the ship to about six feet water at low water, and by a vigorous effort we could bring the ship so light as (when the cargo should be all discharged) to be easily removed into deeper water. But as the external application might be disturbed by so doing, or totally removed by the agitation of the ship, it was absolutely necessary to provide some permanent security for the lives of those who were to navigate her to the Thames. I then recommended as the cheapest, quickest, and most effectual plan, to lay a deck in the hold, as low as the water could be pumped to, framed so solidly and securely, and caulked so tight, as to swim the ship independent of her own leaky bottom. Beams of fir timber twelve inches square were placed in the hold under every lower deck beam in the ship, as low as the water could permit; these were in two pieces for the convenience of getting them down, and also for the better fixing them, of an exact length, and well bolted together when in their places. Over these were laid long Dantzic deals of two inches and a half thick, well nailed and caulked. Against the ship's side, all fore and aft, was well nailed a piece of fir twelve inches broad, and six inches thick the lower and three inches on the upper edge to prevent the deck from rising at the side. Over the deck, at every beam, was laid a cross piece of fir timber six inches deep and twelve broad, reaching from the pillar of the hold to the ship's side, on which the shores were to be placed to resist the pressure of the water beneath. On each of these, and against the lower deck beam, at equal distances from the side and middle of the ship, was placed an upright shore, six inches by twelve, the lower end let two inches into the cross piece. From the foot of this shore to the ship's side, under the end of every lower deck beam, was placed a diagonal shore six inches by twelve, to ease the ship's deck of part of the strain by throwing it on the side. An upright shore of three inches by twelve was placed from the end of every cross piece to the lower deck beams at the side, and one of three inches by twelve on the midship end of every cross piece to the lower deck beam, and nailed to the pillars in the hold. Two firm-tight bulkheads or partitions were made as near the extremes of the ship as possible. The ceiling or inside plank of the ship was very securely caulked up to the lower deck, and the whole formed a complete ship with a flat bottom within side, to swim the outside leaky one; and that bottom being depressed six feet below the external water, resisted the ship's weight above it equal to 581 tons, and safely conveyed her to the dry dock at Deptford.

SHIP-BUILDING.

This important subject, taken in its strict and proper signification may be defined, the art of constructing or building ships: in its less confined and more extended application, however, it embraces, 1st. The plan or form of the construction of ships, comprehending all that falls within the science or theory of naval architecture; 2d The execution of the plans formed, or the art of ship-building.

History.—Naval architecture can hardly be said to have existed amongst the ancient nations of Europe, and all the researches that have been made into its origin and progress have but ill rewarded the labor and loss of time bestowed upon them. To whom we are indebted for this noble invention is uncertain; the probability is that to no nation in particular can it be attributed, but that it was the simultaneous offspring of necessity in different parts of the world. "The truth is," as sir Walter Raleigh justly observes, "that all nations, how remote soever, being able and reasonable creatures, and enjoying one and the same imagination and fantasy, have devised according to their means and materials the same thing." Thus, we find boats precisely similar to the ancient British coracles, made of wattled twigs of willow, and covered with the hides of oxen, employed, in the time of Herodotus, to bring down to Babylon the productions of the higher parts of Assyria, and the countries watered by the Euphrates. In Hannibal's invasion of Italy, his army was transported over the Rhone by the Gauls in canoes made of the trunks of trees, exactly resembling those in almost universal use among the Indians of America, and the savage islanders of the South Seas.

The first who appear to have made any though but little progress in the art, were the Egyptians and Phœnicians. The Nile, which intersected their country, presented to the former a less dangerous opportunity of making their first attempts in navigation than the sea did; whilst the enterprising spirit which marked the Phœnician character, together with the advantageous situation of their two great cities, Tyre and Sidon, urged them to bolder attempts. The bark used on the Nile, when Herodotus visited Egypt, was formed of the acanthia tree, a species of thorn, cut into pieces about three feet square; these were lapped over like tiles, and fastened together by a number of wooden pins similar to the tree nails of modern times. The hull being thus completed, a mast formed of a straight stick of the acanthia, and a sail of papyrus, furnished the means of impelling it, while a rudder passing through the keel or bottom of the vessel served to direct it. The religious prejudices of the Egyptians confining their navigation to the Nile during several centuries, and this mode of construction sufficing for all purposes connected with it, they did not make any further attempts at improvement. The case was entirely different with the inhabitants of Tyre and Sidon, whom the united

testimony of ancient authors warrants us in considering as the boldest and most experienced navigators of the ancient world. No particular account is however afforded us of the form or mode of construction of their ships farther than this,—that for the purposes of commerce they were considerably shorter and broader than those which in after times were devoted to the destructive ends of war and plunder.

However, while we attribute this comparative pre-eminence in the early improvement of the art to the Phœnicians, we are not to consider every other nation as totally ignorant of it. One nation of the East, scarcely known to the ancients even by name, had in all probability made a very considerable progress in naval Architecture. The ships of the Chinese, as described by that accurate observer and faithful narrator, Marco Polo, were precisely in the thirteenth century what they now are, and what they probably were thirteen centuries before that period. We know, from the account of one of the Mahometan travellers who visited China four centuries before Marco Polo's time, that these ships were in the habit of trading to the Persian Gulph, and that they were *large* ships, for "in this sea," says he, "are rocks called Oman, and a narrow strait called Dordur, between two rocks, through which *small* vessels do venture, but the *Chinese ships* dare not." They are now and were such as may fairly be put on a level with the ships of Great Britain in the early part of the reign of Henry VIII. Still in the East in general, the art was in the lowest state, especially if we are to believe that 3000 ships of Semiramis, carried on camels' backs from the shores of Syria to the banks of the Indus, overcame 4000 ships of Staurobates on that river. The state in which the art of ship-building was found when Europeans re-visited India certainly does not invalidate the accounts given of it by ancient authors.

The principal improvements introduced by the Greeks and Romans upon the vessels of the Phœnicians were, an increase of their bulk, and an adaptation of their form and construction to the peculiar use for which they were designed. Experience soon taught them that sails, applicable and even necessary as they were to vessels engaged in the purposes of commerce, were by no means proper to be used at all times in ships of war, the effect and almost the utility of the latter depending entirely on their celerity of motion at a particular point of time, while the benefits of the former were mainly derived from the greatest abridgment of labor and expense that could possibly be made. On the same principle it was that they introduced a distinction between the form of their ships of war and those of burthen; a distinction which became common to all nations as soon as the art of navigation was applied to two purposes, and which has in some degree been continued even to the present day. The "*navis longa*," or ship of war, was much longer in proportion to its breadth than

the "*navis oneraria*," or ship of burthen, which, built either for the purposes of commerce, or for the conveyance of troops and warlike stores, was deeper and broader, so as to be capable of containing a much larger quantity of commodities than under the adoption of any other practised form.

The hull of the ships of the ancients consisted of the "*prora*" or head, the "*puppis*" or stern, and the "*alveus*" or midship frame. Under the bottom and along the centre of the latter passed the "*carina*" or keel, which served as it does in modern use for the foundation of the ribs or timbers which strengthened the sides. To the keel subsequent experience suggested the addition of the keelson, which confining the heads of the floor timbers, then in two parts, jointed into and divided by the keel, very materially contributed to the strength and safety of the vessel. Close to the keelson was the well, intended as a receptacle for the bilge water, and immediately above it was the hold. Aloft, beams were fixed which served both to support the deck and strengthen the fabric, and the planking being put on, completely enclosed the frame, being firmly attached and fastened to it by means of large nails or bolts of iron. As it was found impossible, particularly for vessels of large dimensions, to procure planks of sufficient length to extend from stem to stern, the danger or inconvenience that might have arisen from the starting of an end was in a great measure obviated by the ingenious method of dovetailing them into one another. To render the seams water-tight, the frame was then besmeared with a mixture of wax and pitch or resin, and with the addition of holes in the sides to receive the oars, and seats for the rowers, the hull was complete.

Up to the period of the commencement of the empire, the Romans had vessels of different sizes, variously named from their rows or ranks of oars. Those which had two rows or tiers were called *biremes*; three, *triremes*; four, *quadriremes*; and five, *quinqueremes* or *penteres*. But during the reign of Augustus, and the subsequent ages of the empire, scarcely any vessels were used except the *Liburnæ*, a species of light vessel without decks and with only one tier of oars, which obtained their great celebrity on account of the very singular service they rendered Augustus at the battle of Actium against the "floating castles and towers" of his opponent. "The navy maintained by the emperors might seem inadequate to their greatness, but it was fully sufficient for every useful purpose of government. The ambition of the Romans was confined to the land, nor was that warlike people ever actuated by the enterprising spirit which had prompted the navigators of Tyre, of Carthage, and even of Marseilles, to enlarge the bounds of the world, and to explore the most remote coasts of the ocean."

It is singular, too, that its revival should have taken place among a people now almost unknown, to speak of them in the highest terms as a maritime power. The Veneti, driven from the lands of their forefathers during the invasion of Italy by Attila, retired to a cluster of small islands at the head of the Adriatic, where, in a situation admirably adapted for the purposes to which they devoted themselves, they slowly, but progressively raised themselves to a high pitch of affluence and power. The effect on naval architecture was such as might have been expected, and though the Venetian galley of the ninth century could not boast of the ostentatious magnificence of the floating palaces of Trajan and Caligula, yet as it combined much of their elegance and splendour with more of strength and real utility than they possessed, it may indeed be said to have surpassed them.

The Mediterranean galley of that period bore a great resemblance to that of ancient Rome; it was low-built, sharp, of great length in proportion to its breadth, and was nearly identical with it in the arrangement of the head and stern; in fact, it possessed all those peculiarities which have for ages distinguished it from every class of vessels in existence. The rivalry of the Venetians and Genoese, was a source of material improvement in the mechanical portion of the art of ship-building, although the peculiarity of their local situation, and the contracted scale on which naval warfare was then conducted, rendered any great extension of ideas, or very considerable alteration in marine architecture, impossible because unnecessary. The vessels of the Italian states, both of commerce and of war, fully answered the purposes to which they were devoted; and so little alteration, except in the mechanical arrangement of their parts, took place from the tenth to the fourteenth century, that a description of the galley of the one period would almost suffice for that of the other.

The discoveries of the mariner's compass and of gunpowder, which followed closely upon the heels of each other in the fourteenth century, gave however a new and powerful impulse to ship-building and navigation; but it was not until after the introduction of cannon and their more general application to the purposes of naval warfare, that we find that material variation and enlargement in the structure of vessels, especially of those intended for war, which quickly grew into general use, and has indeed been gradually increasing down to the present day. The progressive steps by which this was effected, and by which the galley was converted into what is now called a ship of war, may be traced in a comparison of the three classes of vessels in use among the Mediterranean powers during the fifteenth and sixteenth centuries, the galley, the galleas, and the galleon. The first

still retained the use of oars, and indeed varied very little in general appearance from that vessel. But when the use of artillery in ships of war became more general and particularly towards the end of the fifteenth century, when port-holes were first introduced, it became necessary to elevate their sides considerably more than it had been customary to do before. To have effected this by continuing them to the requisite height in a prolongation of the same curved line in which the sides of the galley rose, would have been both inexpedient and dangerous; for, independent of the length of beam which would have been necessary, the form of that curve was but ill adapted to resist the great pressure occasioned by the weight of the heavy cannon on the deck. To remedy this the builders of Venice fell into the strange absurdity of contracting vessels in their upper works to such a degree that the deck was scarcely half the breadth of the hold. This we observe in the galleon, which was much broader and somewhat shorter than the galley. Its superiority also over which was strikingly evinced at the battle of Lepanto, where six Venetian galleons effectually withstood the onset of the whole Turkish fleet.

The Spaniards and Portuguese followed the example of the Venetians; the Dutch and other northern powers derived their knowledge from the same masters; and the English were indebted to Italian shipwrights, whom Henry VIII. invited over to his kingdom, that they might impart to his subjects a portion of their own superior skill in the art. Previous to his reign England had no regular navy, and on occasions of emergency ships were hired from the Venetians, Genoese, the Hanse Towns, and other trading people, which, together with the complement furnished by the Cinque Ports, formed the strength of her fleets. Aware of the inconvenience of this, Henry resolved to establish a permanent naval force, and at the same time he encouraged his people to change their rude ill-constructed barks for the superior pieces of mechanism exhibited by their preceptors. He caused several "shippes royall" to be built, of which the *Regent* was the largest, being of about 1000 tons, and carrying from 600 to 700 men. Being burnt in action the same year she was launched, she was replaced by the "*Harry grace a Dieu*." If we are to trust the curious representation transmitted to us of this ship by a drawing in the Pepysian Library, the slightest inspection will be sufficient to convince any one that a vessel so constructed could never have been serviceable at sea as a ship of war, or even safe to the navigators were the water otherwise than perfectly calm. Her high and lofty poop, and her fore-castle of three tier of guns, her shapeless body and her four short masts, bear altogether a striking resemblance to a large Chinese junk.

We must not however attempt to estimate the size of these ships as we are accustomed to do with those of the present day, from the number of their guns; and we shall readily conceive how unfit they were for carrying those allotted to them, when we are told that in coming out of

Portsmouth Harbour, "the *Marie Rose* by a little sway of the ship in casting about (her ports being within sixteen inches of the water) was overset and lost, &c."

Of the general contour or shape of ships only one idea seems to have been entertained by maritime powers, till towards the end of the seventeenth century; but as regards their burthen and force the case was different, the Spanish and Portuguese ships of war having attained a pre-eminence which they continued to maintain for a long period of time. Before the end of the sixteenth century some of their vessels mounted nearly 80 carriage guns; and in tonnage their superiority was still greater. The largest ship in the British Navy at the same period, the *Triumph*, carried only 50 guns, or cannon which deserved that name. The Dutch and Northern powers were still more moderate, endeavouring however to make up their deficiency in this respect, by increasing their numbers.

The earliest ship of three whole tiers of guns, of which we have any distinct records appears to have been the *Sovereign of the Seas*, of 100 guns, built by Phineas Pett, in 1637. Considering the then very imperfect state of naval science, and the almost total absence of data to guide him, this attempt of Pett's was certainly a very hazardous one, and nothing but the bold increase of dimensions, which his science enabled him to give to this ship, rendered it at all successful. She was found however to partake too largely of the prevailing defect which characterised the vessels of her day; the great weight of her enormous upper works, rendered her so top-heavy, that it became necessary to remove one of her decks, and her name was changed to the *Royal Sovereign*; in this state she continued for nearly 60 years, one of the best and most durable ships in the British Navy.

But about this period, towards the end of the seventeenth century, a new era may be said to have commenced in Naval Architecture. While, in this country after the death of Pett, the subject was entirely neglected, in France every incitement was held out, under the auspices of Louis XIV., and his successors, for men of genius and learning, to cultivate the mathematical principles of naval construction. The physico-mathematical laws of floating bodies which from the time of Archimedes, had lain dormant, began to be applied to ships, and the gradual development of the fundamental principles of naval construction, by some of the most eminent mathematicians of the eighteenth century, gave rise to ships of the line of greatly enlarged dimensions and improved qualities. The superior knowledge of the French constructors enabled them at an early period of their efforts, to overcome those obstacles in the construction of two-decked ships of the line, which baffled the skill of our naval architects; and though at first they did not meet with equal success in their ships of 90 and 104 guns (which still however in qualities greatly surpassed our own of a similar class,) yet the constant patronage bestowed on them by their govern-

ment was at length rewarded by the production of three-decked ships of the line of superior force, and endowed with every desirable qualification in almost as eminent a degree as were those of two decks; and a further improvement in 1786, which increased their force to 120 guns, and carried the length to 209 feet, may be said to have completed their triumph of the French architects. At this time, and until 1790, the largest three-decker in the English navy, was the *Victory*, of 100 guns, and 186 feet in length. In that year was built the *Ville de Paris*, of 100 guns, and 190 feet in length, and the *victory of St. Vincent*, in 1797, put in our possession the *San Josef* of 112 guns, which was for many years the largest and finest ship in the fleet. But that which contributed most materially to the improvement of, and in fact furnished a model for, our first class ships was the obtaining possession of that splendid proof of the skill and science of the French naval constructors, the *Commerce de Marseilles*, which was brought to England, from Toulon, in 1793, and on the plan of which the *Caledonia* was formed in 1808. The following are the comparative dimensions of the two ships.

	Length of Gun Deck. ft. in.	Extreme Breadth	Tonnage.
<i>Caledonia</i>	205 0	53 3	2616
<i>Commerce de Marseilles</i>	208 4	54 9½	2747

If we attentively examine the progress of marine architecture, since the introduction of cannon into naval warfare, and more particularly during the last century and a half, we shall clearly perceive that one cause of the improvements that have been made in the sea-going qualities of ships of the line is the gradual increase of dimensions which has taken place, more especially as regards the length, the ratio of which to the breadth has been augmented within the last century, from 3½. 1 to 4. 1. Whether that principle is capable of still further application, or whether we have arrived at its utmost practicable limits, is a question which remains to be decided. The French are said to be constructing a first-rate of 232 English feet in length, and the Americans have ventured on a still bolder attempt; they are said to have built a three decker of 245 feet in length, and 56 feet in breadth, to carry 135 guns. But it yet remains to be seen on actual trial, whether this be really an improvement and whether as has been supposed by some, it will not render the manœuvring of a ship too slow. On a subject involving such a complication of circumstances an opinion cannot with propriety be hazarded either the one way or the other.

SECT. I.—OF THE PROPERTIES OF SHIPS.

The principal elements to be determined in the formation of a design for a ship of war are 1st, its displacement, or the quantity of water which it will displace, when permanently at rest, together with the centre of gravity of that displacement; 2nd, its stability, or the power of

resistance, which it will possess, to the inclination produced by the action of the wind upon the sails; and 3rd, the centre of gravity of the vessel itself considered as a heterogeneous body. We shall proceed to consider each of those three subjects as comprehensively as our limits will allow.

CHAP. I.—OF THE DISPLACEMENT.

When a solid floats in a liquid it displaces a quantity of that liquid, equal in weight to the entire solid, and in bulk to only that portion of it which is immersed; and the greater the weight of the solid, the greater will be the magnitude of the volume displaced, and of the part immersed. Therefore the quantity of water displaced by the immersion of a ship is equal in weight to the ship itself. In ships of war it is absolutely necessary that the line of floatation, or the line marking the depth of immersion be previously determined, so that on actual trial, the immersion may be found neither too great or too small, in the one case endangering the stability of the ship, in the other its immediate safety. This line varies with the displacement, to find an expression for which in terms of some known properties of the ship becomes then of the highest importance. Were a ship any regular figure, this might easily be accomplished by the aid of geometry, but the irregularity and variety of its curves render it a matter of impossibility to obtain an exact measure of the solid contents of its displacement. A method of approximation is given by Bouguer, which consists in dividing it by horizontal and vertical planes into a number of small solids, the contents of each of which are found separately by considering its curved lines and surfaces as straight lines and planes, and the sum of the solidities of all is the measure of the displacement.

This operation gives a result sufficiently accurate for general practice, and, by increasing the number of sections, the error which arises from the supposition of right lines and planes would become insensible; still it is better to employ the more rigorous method of Chapman, which, when both are applied to the same number of sections, is much more exact, without being less expeditious. It proceeds upon the supposition that the curves of the displacement are portions of a parabola, which, from the infinite variation of which it admits, may be made almost to coincide with any curve for a small distance; and from the properties of that curve and those of the trapezoid is obtained an expression sufficiently simple for practical application. This is effected by what is termed the method of equidistant ordinates, which was originally employed by Stirling and Simpson to approximate the areas of curves of any kind, though to Chapman certainly belongs the merit of having first applied it to naval mensurations. We shall endeavour briefly to develop it.

Let A H L O G (PLATE I, FIG I.) be a plane bounded by any curved line whatsoever; it is required to find the area of that plane. Divide

the line $A G$ into a number of equal parts, and through the points of division A, B, C, D, E and F , draw $A H, B I, C K, D L, E M, F N$, and $G O$, perpendicular to $A G$, and cutting the curve in the points H, I, K, L, M, N , and O , and join the straight line $H K$. Each of the spaces such as $A H I K C$ will then be made up of a trapezoid, $A H I C$, and a parabolic segment, $H I K R$. As the distance between the points H, I and K , is by supposition small, any other curved line passing through those points would not differ materially from the curve $H I K$. Therefore in calculating the area of $H I K R$ we shall not commit any considerable error if we substitute for that curve any other passing through the same points; and as we have a simple expression for the value of a parabolic segment, let us suppose the substituted curve to be of that nature. Then $I R$ will be a diameter, and $H R, R K$, ordinates to the parabola $H I K$. Put $A H, B I, C K, D L$, &c., $= a, b, c, d, e, f, g$, respectively, and let m express their common distance. The area of the trapezoid $A H I C = m, (a+c)$, (Art. Mensuration, Prob. V); and the area of the parabolic segment $H I K R =$ two-thirds of the parallelogram $H I K, I R$, (Art. Mens. Prob. XIX.) $= \frac{2}{3} (H P \times I R)$. Put $I R = B I - B R$, and $B R = \frac{1}{2} (A H + C K)$ therefore $H I K R = \frac{2}{3} \left(b - \frac{1}{2} (a+c) \right) \times 2m = (2b - a - c) \frac{2}{3} m$. Therefore $A H I K C = \frac{1}{3} m (a + 4b + c)$. In the same manner it will be found that $C K L M F = \frac{1}{3} m (c + 4d + e)$ and $E M N O G = \frac{1}{3} m (e + 4f + g)$. Therefore the area of the whole surface $A H I L O G$ will be equal to the sum of these three quantities or $= (a + 4b + 2c + 4d + 2e + 4f + g) \frac{1}{3} m$. This expression shows us that to find the area of a figure bounded by a curve of any kind, we must first divide a line supposed to pass through the figure in the direction of its greatest length, and which we may call its axis into an even number of equal parts, and then erect perpendiculars or ordinates to this axis through the points of division, which ordinates will thus be uneven in number. Giving the first ordinate unity for a co-efficient, we must multiply the second by 4, the third by 2, the fourth by 4, the fifth by 2, and so on alternately multiply by those numbers until the last ordinate which, as the first, is multiplied by 1. Adding these products together, the sum is to be multiplied by one-third of the common distance of the ordinates, and the result will be the area required.

We must now apply this demonstration to find the contents of solid bodies bounded by curved surfaces of any kind. Let $S R V$ (Fig. 2) be a solid generated by the revolution of any curve $S M V$ about its axis $S H$; it is required to ascertain the solidity of the whole body $S R V$ and a part $M V R P$. Divide the line $Q H$ into a certain number of equal parts and supposed planes passing through the points of division, perpendicular to the axis $S H$, which call m . Put a, b, c , respectively equal to the diameters $V R, L O$, and $M P$ of those circular planes or sections, produce $H V, N L$, and $Q M$ to the points T, G , and F , so that the lines $H T, N G$,

and $Q F$ may be respectively equal to the areas of the corresponding circular sections (those areas being here considered as abstract numbers), and through T, G , and F draw the curve $T G F$. It is evident that the area $F Q H T$ will be an expression for the solidity of $M P R V$. Then if p be the area of a circle whose diameter is unity, $p a^2, p b^2, p c^2$, will be the areas of the sections made by the planes $R V, O L, P M$, and the ordinates $H T, N G$, and $Q F$ being respectively equal to $p a^2, p b^2, p c^2$, the expression which we obtained for the area of a surface bounded by a curved line is also applicable to find the contents of a solid, bounded by a curved plane. Thus if $Q H$ be divided into only two equal parts, the area of $H T F Q$ will $= (F Q + 4 G N + T H) \frac{1}{3} N H$, and consequently the solidity of the body $M P R V = (c^2 + 4 b^2 + a^2) p \times \frac{1}{3} N H$. If $H Q = S Q = \frac{1}{2} S H = \frac{1}{2} m$, and the plane which passes through S being O , the solidity of the whole body $S R V = (o + 4 c^2 + a^2) p \times \frac{1}{3} H Q = (4 c^2 + a^2) p \times \frac{1}{6} m$.

If the generating line $S M V$ were a right line, the solid would be a cone, and then $R V = 2 P M$, or $R V^2 = 4 P M^2$ or $a^2 = 4 c^2$ and the expression for the solidity in this case would become $= 2 a^2 p \times \frac{1}{6} m = p a^2 \times \frac{1}{3} m$, or $=$ the product of the surface of the base by one-third of the height; the same result as that which is obtained by ordinary geometry. (Art. Mens. Prob. XXVI). Again, if $S M V$ were a parabola, the solid would be a paraboloid, and $R V^2 : P M^2 :: S H : S Q$ or $:: 2 : 1$. Therefore $R V^2 = 2 P M^2$ or $a^2 = 2 c^2$, and the expression would become $= 3 a^2 p \frac{1}{6} m = p a^2 \frac{1}{2} m$, the same as that which is determined by other means. (Mens. Prob. XXXIX). When $S M V$ is a quarter of a circle, or of an ellipse, the solid becomes a hemisphere or a semiellipsoid, and the result obtained for its solidity in those cases by means of the above formula agree precisely with those obtained by the ordinary method. The expression is then a general one; it is also applicable to the measurement of solids whose generating curve does not take its origin from the axis. Let $S S' R V$ (Fig. 3.) be such a solid whose generating line $S M V$ does not commence from the axis $S Q H$. Calling f the diameter of its extreme vertical section and preserving the preceding denominations, it is evident that the solidity of this body will be $= (f^2 + 4c^2 + a^2) p \frac{1}{6} m$; an expression which becomes the same as the formula we have obtained above if we suppose $f = o$. If the line $S M V$ be a right line and parallel to the axis $S H$, the solid will be a cylinder, all the sections of which $p a^2, p c^2, p f^2$, will be equal to the base, and the expression for the solidity becomes $= 6 a^2 p \frac{1}{6} m = p a^2 m$, or the product of the base by the height.

If $S M V$ be a right line, but not parallel to the axis, the solid will be a truncated cone; if it be a parabola the solid will be a truncated paraboloid; if a portion of the circumference of a circle or of an ellipse, it will be a portion of a sphere or of an ellipsoid. In all these cases the formula must contain three terms, and we can only reduce it to two, but in considering the first term as equal to the sum of the two

first, as in the case where $f=0$, when the expression $(o+4c^2+a^2) p_b^2 m$ becomes $(4c^2+a^2) p_b^2 m$.

We have before observed, that it is of the utmost importance to know, previous to actual trial, what will be the amount of immersion of a ship, especially of war; for it is absolutely necessary that her lower ports should be elevated a certain distance from the water, and it is equally indispensable that that distance be not too great. To ascertain then from the plans which have been laid down, what this amount will be, a line must be found such that a horizontal plane drawn through it shall cut off a portion of the vessel equal in bulk to a quantity of water, whose weight is that of the entire ship and its contents. That line will mark the depth of immersion of the ship.

Let FIG. 1, PLATE II., be the plan of elevation of a ship. Assume A B, its line of floatation when fully equipped, it is required to know if the portion A B C D, cut off by a horizontal passing through that line, will be equal in bulk to a quantity of water, equal in weight to the ship. Draw the lines marked Φ , 3, 6, 9, 12, &c., C, F, I, &c., which will represent as many vertical sections at equal distances, and perpendicular to the keel. The elevation of these sections is given in FIG. 2, Φ is the midship or greatest section, to the right of which is represented the half of each after section, 3, 6, 9, 12, &c.; to the left of each forward section, C,

F, L, M, &c. At any given equal distances draw lines parallel to A B (FIG. 1); these lines are also represented on the vertical elevation, FIG. 7, PL. 1, by those marked 1, 2, 3, 4, 5, 6, 7; the figure 1 expressing the first or upper line of floatation, 2 the second, 3 the third, and so on. Each section will then have seven ordinates to it, whose dimensions are known, and its area may be obtained by the application of the expression which we have found for the surface of a plane bounded by any curved line $= (a+4b+2c+4d+2e+4f+g) \frac{1}{3} m$, $a, b, c, d, \&c.$, representing severally the first, second, third, fourth, &c., ordinates. Substituting then for these ordinates their respective values which are obtained by admeasurement from the plans laid down, and giving them for co-efficients, 1, 4, 2, 4, 2, 4, 1, their sum multiplied by one-third of the common distance m of the lines of floatation will give the area of the half of that portion of the section which is included between the first and last ordinates. The area of the remaining triangular portion contained between the last line of floatation, and the keel being added, the result will be the area of the entire half section. Our limits necessarily preclude us from entering into the process of the calculation of the area of every section, we shall, therefore, content ourselves with giving the following tabular view, which exhibits the operation for three sections, the midship Φ , the foremost W, and the aftermost 27.

TABLE I.

Lines of Float.	SECTION Φ .			SECTION W.			SECTION 27.		
	Ordinates.	Co-efficients.	Area.	Ordinates.	Co-efficients.	Area.	Ordinates.	Co-efficients.	Area.
1	14.80	$\times 1 =$	14.80	5.00	$\times 1 =$	5.00	4.67	$\times 1 =$	4.67

As the two parts into which a ship is divided by a vertical plane passing through the longer axis and coincident with the keel, are equal and similar, it is usual in ascertaining the displacement, to perform the calculation for only one of those parts, and then double the result; it is for this reason that we have, as will be seen above, operated for each half section.

Let us suppose the formula by the application of which, we have obtained those results to have been extended to every vertical section, and the areas of all to have been thus found. In conformity with the demonstration which we have given above, we must, to find the solidity of the displacement, employ those areas as we have just employed their ordinates; that is to say,

giving the first and last unity for co-efficients, we must multiply the intervening ones alternately by 4 and 2, the sum of these products being then multiplied by one-third of the common distance between the sections, the result will be the solid contents of the portion included between the two extreme sections. Adding to this the solidity of the two portions comprised between the foremost section and the stem, and the aftermost one and the stern, the sum will be the measure of the entire contents of the displacement, exclusive of the planking, the stem, the stern-post, and the keel. The following table shows the operation.

Having thus found the number of cubic feet which the immersed part of the vessel ought to displace, we must multiply it by the number of pounds contained in one cubic foot of water, and the product will be the weight which the vessel fully equipped and armed ought to possess in order to fulfil the condition of its being immersed in the fluid to the depth of that which we have assumed as the line of floatation, A B. If the actual weight of the ship, which is of course known, be greater or less than the product, that line will not be its true line of floatation, and if it be desired to know that which really will, it is only necessary to reduce the

excess or deficiency of that weight to the denomination of cubic feet of volume, which is easily accomplished in dividing that difference by the number of pounds contained in a cubic foot of water; and then to divide the number of cubic feet thus found, by the area of the plane of floatation A B. The result will give the quantity by which the true line will be more or less elevated than the line A B. This operation is founded upon the fact, that the vessel ought to be immersed, more or less, and consequently, displace a new volume, greater or less than that which we have obtained, by a quantity equal to a portion of the fluid, whose weight is the difference of the weight of the ship, and that of the displacement calculated. But the base of this displacement is the section or plane of floatation A B, and its altitude is the quantity expressing the greater or less depth to which the vessel ought to sink. Therefore, dividing the volume of difference by the area of the plane of floatation, the quotient will be the difference of elevation between the real and assumed lines.

CHAP. II.—THE CENTRE OF GRAVITY OF THE DISPLACEMENT.

Having thus given a method of ascertaining the displacement, our next object will be to find the centre of gravity of that displacement, both in relation to its length and breadth. The position of this point, as regards its distance from the plane of floatation, greatly affects the stability, and its situation in reference to the middle of the length, influences the sailing properties of a ship. We, therefore, proceed, first, to find the centre of gravity of the plane A H O G, FIG. 1, PL. 1.

The centre of gravity of the parabolic segment, H I K R H, is evidently in the line I R, and its distance from the line A H is $= A B = M$. The distance of the centre of gravity of the sectangle A H P C, from the same line is $= m$, and that of the triangle H K P is $= \frac{1}{3} A C = \frac{1}{3} m$. The distance of their common centre of gravity is equal to the sum of their momenta, or products of their areas multiplied each by the distance of its centre of gravity from A H, divided by the sum of those areas. Hence the distance of the centre of gravity of A H K C, from A H is $= \frac{a \cdot 2m \cdot m + (c-a) \cdot m \cdot \frac{1}{3}m}{(a+c)m} = \left(\frac{a+2c}{a+c} \right) \frac{1}{3}m$, and therefore the momentum of the trapezoid in relation to the line A H $= \left(\frac{a+2c}{a+c} \right) \frac{1}{3}m \times (a+c)m$

$= (a+2c) \frac{1}{3}m^2$. The area of the parabolic segment H I K R H $= (2b-a-c) \frac{1}{3}m$, and its momentum in relation to A H, therefore $= (2b-a-c) \frac{1}{3}m^2$; adding together then this momentum, and that of the trapezoid, and dividing the sum by the area of the whole A H I K C, the quotient will be the distance of the centre of gravity of that space from the line A H

$$= \frac{(a \times 2c) \frac{1}{3}m^2 + (2b-a-c) \frac{1}{3}m^2}{(a+4b+c) \frac{1}{3}m} = \left(\frac{4b+2c}{a+4b+c} \right) m$$

In like manner the distance of the centre of gravity of C K L M N E from the line C K

$$= \left(\frac{4d+2e}{c+4d+e} \right) m, \text{ and from A H } = \left(\frac{4d+2e}{c+4d+e} \right)$$

$m + 2m = \left(\frac{2c + 12d + 4e}{c + 4d + e} \right) m$; and that of from A E $= \left(\frac{4e + 20f + 6g}{e + 4f + g} \right) m$. By the same rule, the distance of the centre of gravity of E M N O G from E M $= \left(\frac{4f + 2g}{e + 4f + g} \right) m$, or these three spaces, or of A H O G

$$\begin{aligned} & \frac{(4b + 2c) \frac{1}{2} m^2 + (2c + 12d + 4e) \frac{1}{2} m^2 + (4e + 20f + 6g) \frac{1}{2} m^2}{(a + 4b + 2c + 4d + 2e + 4f + g) \frac{1}{2} m} \\ & = \left(\frac{4b + 4c + 12d + 8e + 20f + 6g}{a + 4b + 2c + 4d + 2e + 4f + g} \right) m. \\ & = \left(\frac{0 \cdot a + 1 \cdot 4b + 2 \cdot 2c + 3 \cdot 4d + 4 \cdot 2e + 5 \cdot 4f + 6 \cdot g}{a + 4b + 2c + 4d + 2e + 4f + g} \right) m. \end{aligned}$$

The numerator of this expression contains the same functions of the ordinates as the denominator, or the same as the formula for the surface of the plane; but they are also multiplied respectively by the natural numbers, 0, 1, 2, 3, 4, &c. Hence the distance of the centre of gravity of a plane from the line which bounds it, is found by means of the expression for the area of that plane; in multiplying the function of the first ordinate by 0, that of the second by 1, of the

third by 2, of the fourth by 3, &c.; in dividing the sum of these products by the area, and then multiplying the quotient by the distance between the ordinates, the result of which will give the distance of the centre of gravity of the plane from its first ordinate. Our next object is the application of this principle to finding the centre of gravity of solids. We have seen that the solidity of the body M P R V, FIG. 2.

$= (c^2 + 4b^2 + a^2) p \frac{1}{2} N H$, and that of S R V $= (o + 4c^2 + a^2) p \frac{1}{2} m$, therefore the distance of the centre of gravity of M P R V, from the plane M P $= \left(\frac{0 \cdot c^2 + 1 \cdot 4b^2 + 2 \cdot a^2}{c^2 + 4b^2 + a^2} \right) N H = \left(\frac{4b^2 + 2a^2}{c^2 + 4b^2 + a^2} \right) N H$; and that of the solid S R V from the plane which passes through S N $= \frac{(0 \cdot 0 + 1 \cdot 4c^2 + 2 \cdot a^2) \frac{1}{2} m}{(o + 4c^2 + a^2)} = \frac{4c^2 + 2a^2}{4c^2 + a^2} m$.

If the solid be a cone, $a^2 = 4c^2$, and the distance is $= \frac{3}{4} m$; if a paraboloid $a^2 = 2c^2$, and the distance becomes $= \frac{3}{4} m$; results which agree with those obtained by ordinary means. To apply this principle to bodies whose generating line does not commence from the axis, we must recur to the expression for the solidity of such bodies. The functions of the ordinates which enter into this expression, are f^2 , $4c^2$, a^2 , and multiplying these by 0, 1, 2, we shall have the distance required $= \left(\frac{4c^2 + 2a^2}{f^2 + 4c^2 + a^2} \right) \frac{1}{2} m$.

If the solid be a cylinder, all these sections or ordinates being equal, we have $c^2 = f^2 = a^2$, and $4c^2 = 4a^2$, consequently in that case, the expression becomes $= \frac{1}{2} m$.

To find then the centre of gravity of the displacement, we must commence by ascertaining the distance of the centre of gravity of the portion included between the two extreme sections, from one of those sections, that marked 27 for example, in the following manner. Multiply the functions of the area of each section, (or the values which we have termed products in Table II.), the first, or that of the area 27 by 0, the second by 1, the third by 2, &c.; divide the sum of these products by the sum of the areas of the sections, and the quotient multiplied by the common distance between the sections, will give the distance required. The respective centres of gravity of the portions comprised between the section 27 and the stern, and that marked W and the stem must then be found; and subtracting from the sum of the moments of the portions contained between the two extreme sections,

and of that contained between the section W and the stem in relation to the section 27, the moment of the part comprised between that section and the stern, divide the remainder by the whole displacement, the quotient will be the distance of the centre of gravity of that displacement from the section 27; whence may easily be found its distance from the midship or any other section. In like manner must be found the distance of that point from the upper line of floatation; with this difference, that instead of employing the areas of the sections, we must make use of those of the different planes of floatation, and the common distance m must be not that of the sections but of those planes. The same ordinates by means of which we found the areas of the sections, will also serve to enable us to ascertain those of the planes of floatation, but employed in a contrary order. Having found the centre of gravity of the portion included between the upper and lower planes of floatation, the moment of that portion must be added to that of the volume contained between the lower plane of floatation and the keel; the sum divided by the whole displacement will give the distance of the centre of gravity of that displacement from the upper plane of floatation, and as its distance from one of the extreme sections has been already ascertained, the position of the point is determined.

CHAP. III.—OF THE STABILITY OF SHIPS.

A floating body is impelled downward by its weight acting in the direction of a vertical line

passing through the centre of gravity of its entire bulk; the pressure of the fluid by which the solid is supported, acts upward in the direction of a vertical line called the line of support or the line of buoyancy, which passes through the centre of gravity of the part immersed, or as it may otherwise be termed the centre of buoyancy, or the point in which we may conceive the buoyancy or action by which the body is sustained to be concentrated; unless, therefore, these two lines are co-incident so that the two centres of gravity may be in the same vertical line, the floating body thus impelled by forces, acting in parallel and contrary directions, must revolve on an axis until it find a position in which it will be at rest. To ascertain when this will be the case, it is necessary to find the proportion of the immersed part to the whole, and it must then be determined by geometrical or analytical methods in what positions the solid can be placed on the surface of the fluid, so that the two centres of gravity already mentioned, may be in the same vertical line when a given part of the solid is immersed under the surface of the fluid. These particulars having been determined, evidently reduce the statement of the problem to a narrow compass, but they alone are insufficient to limit it; for although it has been shown that a body cannot float permanently on a fluid unless the two centres of gravity are situated in the same vertical line, it does not follow that whenever those centres are so situated, the body will float permanently. Positions may be assigned in which the conditions in question are fulfilled, yet, in none of which will the solid rest, but on the contrary, assume some other, in which it will continue permanently to float. Thus, if a cylinder, having its specific gravity to that of the fluid on which it floats, as 3 to 4, and its axis to the diameter of its base as 2 to 1, be placed on the fluid with its axis vertical, it will sink to a depth equal to a diameter and a half of the base; and while its axis is preserved in a vertical position by external force, the centres of gravity of the whole of the part immersed will remain in the same vertical line: but when the external force that sustained it is removed, it will decline from its upright position, and will permanently float with its axis horizontal. If the axis be supposed to be only one-half instead of twice the diameter of the base, and be placed vertically, the cylinder will sink to the depth of three-eighths of its diameter, and in that position will float permanently. Even if the axis be placed not exactly coincident with the vertical direction, but in a line somewhat inclined to it, the solid will change its position until it settles permanently with the axis perpendicular to the horizon. Whether, therefore, a solid floats permanently, or oversets when placed on the surface of a fluid, provided the centre of gravity of the whole, and that of the part immersed, be in the same vertical line, it is said to be in a position of equilibrium; and of this equilibrium there are three species, viz. the equilibrium of stability, instability, and the equilibrium of indifference, or the neutral equilibrium. If the figure and position of the solid be

such, that upon a slight change, by which it still displaces its own weight of fluid, its centre of gravity takes a higher position than it had when in equilibrium, then the solid will float permanently in that position, and that equilibrium will be stable; because the centre of gravity having always a tendency to descend, will return to its former position, and will oscillate from side to side of it until the solid by its friction with the fluid at length attain a state of rest. If on the other hand, a slight disturbance, which still causes the solid to displace its own weight of liquid, make the centre of gravity take a lower position, the body will not return to its former position of equilibrium, nor will it oscillate from side to side of that position, as in the former case; for to do so it would be necessary that the centre of gravity should ascend, an effect which is contrary to its characteristic property. The centre of gravity will, therefore, continue to descend until it gets into another position, such that the line joining it with the centre of gravity of the part immersed, shall be perpendicular to the surface of the fluid. Any disturbance from this position must necessarily cause the centre of gravity to ascend, and the position is, therefore, that of stable equilibrium.

The shape and position of the body may be such that whatever be the position in which it displaces its own weight of the liquid, the elevation of its centre of gravity will be the same; in other words, any motion which it may receive, allowing it still to displace its own weight of liquid, will cause its centre of gravity to move in a horizontal plane, and as in this case the centre of gravity neither ascends nor descends, it will rest in equilibrio in all positions. Such is the state of indifferent, or neutral equilibrium.

When a solid body floats permanently on the surface of a fluid, and external force is applied to incline it from its position, the resistance opposed to that inclination is termed the stability of floating. It is obvious that some floating bodies are more easily inclined from their quiescent position than others, that after having been inclined, some will return to their original situation with more force and celerity than others; a difference which is particularly observable in ships at sea, in some of which a given impulse of the wind will cause a much greater inclination from the perpendicular than in others. To be enabled to resist this inclination, or, in other words, to possess a certain degree of stability, is one of the most indispensable properties of a ship; and, consequently, several eminent mathematicians have investigated rules for determining its amount from the known weight and dimensions of a ship, independently of any recurrence to actual trial. This is effected in a very simple and elegant manner by the metacentric method of Bouguer, which infers the force or measure of the stability from the relative positions of the centre of gravity of the vessel, and a point termed the metacentre, which is obtained as follows:—

Let *W A T B F* (Plate 1, Fig. 4), be a vertical section of a ship, floating in equilibrio, passing

through its centre of gravity; let AB be the upper line of floatation, or water line, G the centre of gravity of the whole body, and D that of the immersed part, ATB . Suppose the vessel now to receive a very small inclination, by which $A'T'B'$ becomes the immersed part, and D' its centre of gravity. From D' draw $D'M$ perpendicular to AB , and meeting DG , produced if necessary in M . If the point M thus found be higher than G , the centre of gravity of the whole body, the vessel will, when the inclining force is removed, return to its former position. If it coincide with G , the vessel will remain in its inclined state: but if it be below G , the inclination will continually increase, until the vessel be entirely overset. That point of intersection M , is called the metacentre, and is the limit of the altitude of the centre of gravity of the vessel. Hence it must be evident that the stability of a ship increases with the elevation of the metacentre above the centre of gravity; and that, if those two points coincide, the ship will have no disposition whatever to move out of the situation into which it may be placed, but will rest on the fluid, indifferent to motion, without tendency to right itself when inclined, or to incline itself further. In this case she would therefore be unable to carry sail, and, consequently, totally unfit for the purposes of navigation. Thirdly, if the metacentre be below the centre of gravity, the vessel will instantly upset. The force of the stability is therefore measured by the height of the metacentre above the centre of gravity; and a mode of ascertaining the exact measure of that force is given by Bouguer; our limits, however, necessarily preclude us from continuing the subject so far, and we shall therefore pass to the more rigorous and general, though at the same time more laborious method of Atwood, for effecting the same object. The theorem which we have given above is in one respect general, not being confined to bodies of any particular form; but, in respect to the angles of inclination, it is restrained to the condition that the deflection from the quiescent position shall be evanescent, or, in a practical sense, very small. In consequence of this restriction the rule in question cannot be generally applied to ascertain the stability of ships at sea; because the angles to which they are frequently inclined being of considerable magnitude, the stability will depend not only on the conditions which enter into Bouguer's solution, but also on the shape given to the sides of the vessel above and beneath the water line, of which he takes no account. Notwithstanding its long calculations, then, it cannot be for one moment doubted that the method of Atwood is greatly superior, and we shall therefore give a brief account of it.

Let $WATBF$ (Fig. 4) be a vertical section of a vessel floating in the upright position, and at rest, and let AB be its water-line. Suppose another plane to be at right angles to the plane of the section, $WATBF$, and divide it into two equal and similar parts in the vertical line, MT , the common section of this last-mentioned plane, with the water's surface, will be a line at right angles to the section $WATBF$, and cut-

ting it in the point S . Let us imagine, for the sake of simplicity, that the body of the vessel has been generated by the invariable section $WATBF$, moving parallel to itself on the common section of the water's surface and longitudinal plane, passing through MT : moreover, suppose that an equal solid is formed in this way, on each side of the plane, $WATBF$. It is clear that the centres of gravity of the vessel, and of the displacement, are in this plane, $WATBF$, and both in the vertical line MT , since the body is at rest: let these two points be G and D respectively. Now, supposing the length of the uniform solid, of which the area, ATB (cut off by the line AB) is the base, to be represented by l , we have the volume of the displacement equal to the area $ATB \cdot l$. Suppose the vessel to have been inclined round the longer axis, so that the points B' and A' , of the section $WATBF$, are coincident with the water's surface, the line joining A' and B' cutting the line AB , in some point S : it follows that there is a solid *emerged*, of which the area ASA' , is the base, and another *immersed*, of which the area, BSB' is the base; the new displacement being equal to the area $ATB \cdot l$. But as the weight of the vessel is the same both before and after the inclination, the two volumes, of which the areas ATB , and $A'TB'$, are respectively the bases, must be equal; and as the volume, whose base is the area $A'TB'$, is common to both, the volumes immersed and emerged must also be equal. The centre of buoyancy corresponding to the inclined position of the vessel remains on the plane $WATBF$, since there is still an equal and uniform volume on each side of it; for the like reasons, the centres of gravity of the volumes immersed and emerged must be in the same plane. Let the new centre of buoyancy be in the point D' , and draw $D'M$, perpendicular to the water's surface, $A'B'$; from G draw GP , parallel to $A'B'$; then will GP be the perpendicular distance from G to the line of support, in which the buoyancy of the water is supposed to act; hence, when the weights and therefore the displacements of different vessels are equal, the stability will be measured by the magnitude of the line GP ; but when this is not the case, the stability will be truly estimated by the quantity $GP \cdot W$; where W = the weight of the vessel with its entire equipment. The quantity $GP \cdot W$; is called the *moment of stability*.

The analytical value of GP may be thus obtained; let R and V be the centres of gravity of the volumes of immersion, and from these points draw RN and VL perpendicular to $A'B'$: also draw DQ parallel to $A'B'$, meeting $D'M$ in Q . It is evident from the preceding article, that the volume of emersion = area $ASA' \cdot l$, and, conceiving it to be concentrated in the point R , we may imagine that it is transferred to the centre of gravity V of the volume of immersion; this transfer will, by a well-known property of the centre of gravity, cause the point D to move through a space (in a direction parallel to the line joining the points R and V) reciprocally proportional to the magnitudes of the $ASA' \cdot l$, and $ATB \cdot l$; and since the motion of the centre of gravity of the volume of emersion is estimated,

in a horizontal sense, by the line NL , and that of the centre of buoyancy in the same direction by the line DQ , we have, by putting $NL + b$, this proportion—

(1.) $b : DQ = \text{area } ATB.l : \text{area } ASA.l$, or
(2.) $b : DQ = \text{area } ATB. : \text{area } ASA'$

and putting $\text{area } ATB.l = V$ and $\text{area } ASA' = l = A$, we derive the equation $DQ = \frac{bA}{V}$. It is

seen from proportion (2), that when the vertical sections made at right angles to the longer axis, are equal and similar, the lines NL and DQ are proportional to the simple areas ATB and ASA' which may therefore be taken, in this case, to represent the volumes of displacement and of emersion or immersion respectively. But if the body be of an irregular form, the construction and demonstration will be precisely similar to that above, supposing the section $WATBF$ to pass through the centre of gravity of the body, and the following modifications of expression taking place; viz., the volumes of displacement, immersion, and emersion, must be obtained by calculations founded on their shape and dimensions, as also the positions of the centres of gravity of the same volumes. We may therefore assume the expression $DQ = \frac{bA}{V}$ as general.

Draw GC parallel to MD' , then will the angle DGC be equal to the angle of inclination BSB' ; putting $GD = d$, and sine of the angle $BSB' = s$, we have $DC = ds$ and $GP = DQ - DC = \frac{bA}{V} - ds$, or $C'P \times V = bA - dsV$.

We may infer from the above expression that whatever form the volume whose base is the area ATB , may assume, provided the distance between the points D and G is not affected thereby, and the whole volume of displacement remains the same, the stability will depend on the configuration of the vessel being unaltered in those parts *immersed* and *emerged* by the inclination; for the term bA of the expression will then experience no change, whilst V is constant, and the quantity, d , kept unchanged by means of ballast or other expedients; consequently the stability of the vessel will remain the same. It is also seen that the space DQ , moved through by the centre of buoyancy, varies directly as bA , and inversely as V ; and if two vessels, of different forms and displacements, have the centres of gravity and of buoyancy coincident in each, their stabilities will be measured by the value of $\frac{bA}{V}$ in both.

It is evident from the preceding general investigation of the equilibrium of stability, that to give a vessel a certain inclination, and to keep it to that inclination, we must employ a power whose moment, with regard to the centre of gravity of the vessel, is equal to the moment of stability. When the inclining force is supposed to vary in quantity, or in the point of application, greater or less inclinations will be produced, and maintained according as its moment is greater or less. If the inclining force cease, the force of stability immediately operates to restore the vessel to the upright position, and continuing to

act at every successive decreasing angle, it will produce an accelerated rotatory motion about an horizontal axis passing through the centre of gravity, until the vessel arrives at the upright position. The angular motion by this time generated in the body will then cause it to pass this position, and incline it on the other side, till such motion is destroyed by the force of stability again called into action, but which is now a retarding force instead of an accelerating one. Thus, the first half of a vibration will be accelerated, and the second half retarded by the force of stability. The species of vibration spoken of here, constitutes what is usually termed *the rolling*; and we may observe, that the force of stability which tends to produce it should be regulated with the angle of inclination, so as to prevent too rapid or sudden a variation in the angular velocity; otherwise the ship will be subject to violent and percussive action when brought to her bearings.

In the Philosophical Transactions for the year 1798, Atwood has exhibited the comparative stability of a variety of known geometrical forms; but the analysis used by him in the investigation of the problems is by no means so concise and general as could be wished, as he treats each case separately, and in a manner both tedious and laborious. The several cases which he considers are—

First. When the sides of a vessel are parallel to the plane of the masts both above and below the water-line.

Second. When the sides fall outwards, at equal angles above, and are parallel to the plane of the masts, under the water-line.

Third. The sides incline inwards, at equal angles above, and are parallel to the masts, under the water-line.

Fourth. The sides fall outwards, both above and beneath the water-line, at equal inclinations to the plane of the masts.

Fifth. When the sides incline inwards, and are at equal angles of inclination to the plane of the masts, both above and beneath the water-line.

Sixth. The sides coincide with the sides of an isosceles wedge; meeting, if produced, at a point beneath the water's surface.

Seventh. The sides are coincident with the sides of an isosceles wedge; meeting, if produced, at a point, which is above the water's surface.

Eighth. The sides of a vessel are parallel to the masts above, and incline outwards, beneath the water-line, at equal angles.

Ninth. The sides are parallel to the masts above, and are inclined inwards, at equal angles, below the water-line.

Tenth. The sides of a vessel are coincident with the surface of a cylinder; the vertical sections being equal circles.

Eleventh. The vertical sections of a vessel are terminated by the arcs of a conic parabola.

And lastly, the case of a vessel of the usual form, in which all the vertical and horizontal sections are not as they are in the above eleven cases, equal and similar. For the application of the general expression to these several cases we

must refer our readers to the original paper of Mr. Atwood above referred to.

CHAP. IV.—OF THE CENTRE OF GRAVITY.

The knowledge of the position of the centre of gravity of a ship, its contents is a point of the greatest importance. It may be admitted as an axiom, that a body put in motion revolves round its own centre of gravity while uninterrupted by any external force, and that the force which imparts that motion does not cause it to revolve about any other point. The centre of gravity is, therefore, the centre of rotation in a ship, and the point to which the different motions of rolling and pitching must be referred. We may also see by a simple inspection of the general expression which we have obtained for the stability, that the determination of the centre of gravity is indispensably necessary in order to ascertain the measure of that force, which consists in fact, in finding the distance of the vertical central line of buoyancy from the centre of gravity. The position of this point may be ascertained by considering the ship as composed of a system of bodies, and finding the common centre of gravity, in the usual manner. Thus the momentum of every part of the ship and its contents, must be found separately, both in relation to a horizontal and a vertical plane. The sums of these two momenta, being divided by the weight of the ship, the quotients will be respectively, the altitude of the centre of gravity, and its distance from the vertical plane; and as this centre is in a vertical line passing through the axis of the keel, its position is therefore determined. This operation has been performed on only two ships in this country, the *Bulwark* and the *Ajax*; the position of the centre of gravity of both of which was ascertained at the school of Naval Architecture, under Dr. Inman, in 1817. The great objection to this method is, that the operation is exceeding long and laborious, when every component element is taken into account; for each of the above ships it occupied two persons a whole year, independent of the assistance of labour in weighing many of the component articles, as stores, blocks, &c.

It becomes then an object of considerable importance to find the position of the centre of gravity of a ship, without regard to the specific circumstances of each component weight of its entire substance. This has been effected by the eminent Spanish author, Don Jorge Juan, and the Swedish architect, Chapman, both in a similar manner, and by means of an experiment on the ship. Their method consists in removing the artillery and component weights of the ship from one side to the other, and by this means inclining it so as to elevate and expose a portion which is ordinarily submerged; and by means of a formula previously obtained, the distance of the centre of gravity from the metacentre is then found. Chapman's mode has, however, two objections which attach to it. In the first place, he uses the metacentre as a measure of stability at an angle of 8° or 10° , which is decidedly erroneous; this is, however, easily corrected by sub-

stituting Atwood's equation; but, secondly, he appears to have entirely overlooked the change of place which the centre of gravity undergoes by the transfer of the guns from one side to the other. These are, however, altogether obviated in a method recommended first, we believe, by Mr. Major, which is as follows:—Let the ship be heeled to the same angle by two separate horizontal forces applied at different heights in the plane of the masts. It is evident that their moments of inclining power must be equal, since they are both sustained by the same force of stability. Let P represent one power, and p the other; and let a and b be respectively their distances of action from the centre of gravity of the displacement. Put x for the distance of the centre of gravity of the ship from that point, and let A be the angle of inclination of the ship from the upright. We shall have then the following equations of their forces, the radius being always unity.

$$\begin{aligned} P(a-x) \cos. A &= p(b-x) \cos. A \\ Pa - Px &= pb - px \\ x &= \frac{Pa - pb}{P - p} \end{aligned}$$

From which we obtain the following rule. Divide the difference of the momenta of the inclining forces by the difference of the same forces, and the result will be the distance of the centre of gravity of the ship from the centre of gravity of the displacement.

Let us now examine the effect which the force concentrated in this point produces on the rolling and pitching of a ship. Let *ADB* (FIG. 5), be the section of a vessel whose line of floatation is *AB*; let *E* be its centre of gravity, and *G* the metacentre. Suppose a force at *B* to act on the side of the vessel in the direction of *BH*, so as to give it the inclination *ab*. The momentum of the force which produces that inclination is as the distance *EII*, and the momentum of that which tends to cause the vessel to return to the upright position, is as the distance *EG*; as these forces act in contrary directions, there results a motion termed rolling; and the effect of the forces producing it is as the sum of *EII* and *EG*. But the vessel during the inclination, must revolve on its centre of gravity, and its displacement must be the same as when it is upright; therefore, the vessel, and consequently its centre of gravity *E*, must be elevated a certain distance *eE* equal to the versed sine of the angle *Gcg*, the radius being *EG*. It follows, therefore, that when the force which operated to produce the inclination ceases, the vessel will descend with its whole weight, in a vertical direction from *e* to *E*, with a force continually accelerating until the action of the buoyancy of the water ceases to operate upon the point *G*, and as the inclination extends frequently to an angle of 30° , the distance *eE* becomes considerable, and consequently the rolling very quick. If the centre of gravity *E* of the ship were in the plane of floatation, and the distance *EG* still the same as above, the motion would be less and easier than when that point is situated lower; for in the first

place the distance EH would be less, and the inclination produced by the force at B acting in the direction BH , would not be so great as if the centre of gravity were lower since the sum of FG and EH would be less; and secondly, the centre of gravity being in the plane of floatation, the vessel is capable of a rotatory motion without itself or its centre of gravity being elevated or depressed, and, therefore, without causing the concussion to which we have alluded. Hence we may conclude, that the motion of rolling is more uniform and less exposed to sudden concussions, when the centre of gravity is in the plane of the water section or near it, than elsewhere; and as this position of the centre of gravity has the same effect upon the pitching, or a vibratory motion of a ship about a horizontal transverse axis, it follows that it ought to be there placed. But it is a matter of exceeding difficulty to construct a vessel which shall possess the requisite degree of stability, and at the same time roll easily for the increase of the distance EG , which augments the stability, contributes also to increase the motion of rolling; and the difficulty becomes still greater in the case of merchant ships where the object is to combine economy of construction with a capability of carrying the greatest possible burthen. A vessel of this nature should be built very broad in its bottom, and should be elevated above the water but very little in proportion to its breadth; consequently it must have the centre of gravity of its displacement, and, therefore the metacentre situated very low. In order to give it stability, it becomes necessary then to place the centre of gravity of the cargo as low as possible, and thus the common centre of gravity of the ship and cargo is situated exceedingly low, and occasions the motions of rolling to be very uneasy.

The preceding remarks apply to the situation of the centre of gravity with reference to its altitude only; it remains, therefore, to consider its position in relation to the length, as it affects the motion of pitching, or the alternate elevation and depression of the two extremities of the vessel. This motion results entirely from the action of the waves; thus, when a wave has passed the fore-part of a ship and arrived towards the middle, it leaves a great cavity under the stern where the ship is entirely unsupported; that portion, therefore, descends with a certain momentum, which is the product of its component weights, multiplied by their distance from that point where the vessel is really supported. This kind of motion is much greater in vessels which are very full and broad, both fore and aft, towards the water line, and which slope considerably beneath; but, if the weights in the fore-part be transferred nearer to the middle, the momentum with which the elevated portion of the ship descends would be lessened, and not only would the motion become easier, but the waves would have less difficulty in raising it. The same observation applies to the after-part of the ship, and we, therefore see that to diminish the motion of pitching, the weights should be brought towards the middle, in which position, we may hence conclude, the centre of gravity ought to be in relation to the length.

CHAP. V.—ON THE RESISTANCE OF THE WATER.

When the body is moved through a fluid, such as water, a force is required to overcome the resistance thereof. The same, or a similar force, is required to retain a body at rest, floating in a fluid in motion; in either case the fluid heaps up, or accumulates, in front of the floating body, until the increasing pressure in all directions produced by this accumulation is sufficient to remove sideways that portion of the fluid intercepted by the floating body, and which afterwards falls into the general current. The effect of this accumulation on the bows has been called the *plus pressure*. Again, the fluid, after passing, will require some time and force to fall in towards the after part or stern of the floating body: this deflection is also caused by some force or hydrostatic pressure, viz. by the water at the stern being somewhat below the level of the passing stream. A portion of the stern, therefore, is not pressed upon by the same force as the bow, even reckoned from the general level of the stream, and independently of the accumulation at the bow; and, therefore, this depression increases the power or resistance of the fluid, by a quantity which has been called the *minus pressure*, or stern resistance. Lastly, the fluid in passing along the side of the floating body is subjected to a certain degree of adhesion or friction, which increases with the extent of surface.

According to the common theory of the impulse of fluids, it is assumed that each particle of the fluid in motion will strike a solid body in its path in the same manner, and with the same force, as in the collision of hard bodies in free space; therefore since the number of particles striking in a given time will be as the velocity, and the force of each particle also proportional to the velocity, we have—

1st. The resistance or impulse is as the square of the velocity.

2nd. The number of particles, and consequently the resistance, will be as the density of the fluid and the magnitude of the surface impinged on.

Again, in oblique impulses, let AB (FIG. 6), be the plane exposed to direct impulse $f'A, f'B$; and BC the same plane exposed to oblique impulse in the same fluid. The number of particles intercepted by BC , will be only as DB or CE , that is the sine of the angle of incidence $O.r.B$; but also the perpendicular action of each particle o , as Om , will be diminished in the ratio of om to $on = BC : CE$, that is, as the sine of incidence; so that we have,

3dly, The direct resistance or impulse is to the oblique effective impulse as the square of radius to the square of the sine of incidence.

From these principles Newton determined that the impulse on a cylinder is $\frac{2}{3}$ that on the transverse section through its axis, and that the impulse on a sphere is $\frac{2}{3}$ that on its great circle.

In like manner, from the same principle, it has been deduced, that the resistance or direct impulse of an inelastic fluid on any plane surface is equal to the weight of a column of the fluid whose base is equal to the surface struck,

and height equal to twice the fall required for producing a velocity equal to that with which the plane moves in the fluid. In elastic fluids the impulse is double of the above (*Principia*, vol. ii. p. 35—38). It does not, however, appear that the theory of resistance here given, from Newton's investigations, is at all accordant with experiments; but, since we have as yet no better to direct our researches, we may endeavour to modify it only so far as the numerous experiments made on the subject may require. In fact, the action of a fluid on any solid body cannot at all be considered as that of a number of hard particles striking it, and then thrown off into free space; for the mobility of the fluid, and the property it possesses of rising above the level, (if like water), or of being compressed, (if like air,) gives it all the properties of an elastic body, and makes its action on the solid that of a simple pressure, the amount of which may be readily measured by that accumulation. This accumulation becomes, in its turn, a moving power, impelling the parts of the fluid below it to escape in all directions, and of course communicating a motion transverse to the general direction of the stream, or rather, perhaps, along the surface of the fluid, and with an increased velocity. The figure of that surface, and its adaptation to the natural path, followed by the filaments of water in passing round and closing in behind the body, greatly affect the observed resistance.

With respect to the agreement of experiments with the above principles, it has been found that the resistance increases nearly as the square of the velocity, little deviation appears in the smaller velocities, and Newton has shown, that by subtracting a certain uniform quantity for the adhesion of the fluid, the remainder agreed exactly with the theory; and that in the greater velocities there is a deviation arising from the inertia of the fluid which accumulates in front, and is rarefied or depressed behind the body.

According to Borda's experiments the resistance to the surface of

	Ratio of Theory to Experiment.
3^2 or 9 inches, being - 9	= 1 : 1
4^2 or 16 — was - 17.535	= 1 : 1.096
6^2 or 36 - - - - - 42.750	= 1 : 1.168
9^2 or 81 - - - - - 104.737	= 1 : 1.294

In larger surfaces, the deviation would probably be much greater, as the smaller afford greater facility of escape.

It appears from the experiments of Mr. Robins, that the resistance of a square foot of air moving with the velocity of one foot per second on 16 inches, is - - - .001596 lbs.

By Borda's experiments the resistance on 16 inches is - - .001757 lbs.

On 81 inches - - - - - .002042 lbs.

Bonguer has calculated that the impulse of sea-water, with a velocity of 1 foot per second, is 23oz. on a square foot, French measure, and that of wind is the same when blowing 24 feet per second. This last velocity would rather be $\sqrt{900} = 30$ feet, if we were to take the density of the air to determine it.

The experiments of the French Academy make the resistance to a square foot moving 2.56 feet per second, to be 7.625lbs.; or, in English maxims, 1.136 square foot moving 2.7263 feet per second, gives a resistance of 8.234lbs. avoird., which is nearly the weight of a column of water of this base, having its height equal to the fall necessary for communicating this velocity, and only $\frac{1}{4}$ the resistance assigned by the Newtonian Theory. If we calculate from the last number, the impulse on 1 square foot moving 1 foot per second, we have 0.973lbs. avoird. Much, however, depends on the form and situation of the adjoining parts. The experiments of the academy were made on a prism, or box, 2 feet square, and 4 feet long. The resistance on a thin board, of the size of the end of this box, would have been greater. Thus, according to Buat, the resistance on a square foot, wholly immersed in a stream, was,

A square foot as a thin plate - -	1.81 lbs.
Ditto, as the front of a box 1 ft. long	1.42
Ditto, as ditto, 3 feet long - - -	1.29
Sea water about $\frac{1}{15}$ greater.	

The resistance to sailing vessels is, therefore, considerably less in the direction of their length than in that of their breadth, upon equal portions of surface, while the resistance to their surface of sail or an oar is the greatest possible. Both these properties are to be appreciated.

We may, therefore, assume that the resistance of water in sailing vessels is about 1.5 lb. per square foot, moving 1 foot per second, and that the impulse on a sail is .002 lb., or $\frac{1}{500}$ lb. for the same surface and velocity; proportions not very distant from that of their relative densities, when modified as before mentioned.

If we estimate the resistance for a velocity of 1 nautical mile per hour, we shall have air per square foot .005 lb., and water per square foot 4.17 lb.

However, the bows of vessels are never made square, and the sails are most frequently placed obliquely. Theory, in this instance, appears at variance with experiments. The best experiments hitherto made in this department of our subject are those of the French Academy. A box, of 3 feet square and 4 long, was made and fitted with prows of a wedge-like form, the angles of which varied by 12° in each set of experiments from 12° to 180° , so that the angles of incidence varied 6° from each other. These boxes being immersed 2 feet in a large basin of water, were drawn obliquely by a line and weights, the motion after a little time becoming very uniform. The time of passing over 96 French feet was then carefully noted, and the resistance calculated from the weight employed, after deducting a certain quantity for friction and the accumulation of water on the anterior surface. The following table exhibits the result of these experiments. Col. 1 is the angle of the prow; col. 2, the angle of incidence; col. 3, the observed resistance; col. 4, the resistance calculated from col. 1, as the squares of the sines of incidence; col. 5, the same reduced as the sines only of incidence.

TABLE III.

Angle of Prow.	Angle of Incidence.	Impulse observed.	Square of Sine.	Sine only.
180°	90°	1000	1000	1000
168	84	989	989	995
156	78	959	957	978
144	72	908	905	951
132	66	845	835	914
120	60	771	750	866
108	54	693	655	809
96	48	615	552	743
84	42	543	448	669
72	36	480	346	587
60	30	440	250	500
48	24	424	165	407
36	18	414	96	309
24	12	406	43	208
12	6	400	11	105
1	2	3	4	5

The error of the theory is as important in the action on sails; for the experiments of Borda and Robins on the oblique impulse of air are very conformable to those of the Academicians on waters, and the neat experiments of the Society for Naval Architecture exhibit similar results. We may therefore observe, that the oblique impulse of the wind is much more efficacious in preserving the ship in the direction of the course than they would suppose; and, in the same manner, the oblique action of the water is more efficacious in resisting lee-way.

From the experiments of the Society for the Improvement of Naval Architecture, it would appear, that in the ordinary velocities, the total resistance of sharp-ended vessels is little more than one-third of those with square ends. The impression of the wind being at the same time more, we are justified, at least, in calculating for velocities of five miles per hour, or upwards, in assuming a pressure of only five pounds per square foot of the cross section of the vessel for a velocity of one foot per second.

CHAP. VI.—POWER OF SAILS.

From the preceding data we may proceed to calculate the rate at which a vessel may pass through the water, her own dimensions, and those of her sails being given.

Case 1. The ship sailing before the wind; let the breadth = b , draft of water = d , the area of sail = a . Let p = the pressure of the wind at one foot per second, q = pressure of water on one square foot at one foot per second, w = velocity of the wind, v = velocity of the ship passing through the water.

The ship sailing before the wind, we have the velocity with which the wind strikes the sails = $w - v$, and the impulse on the sails = $(w - v)^2 p a$. The resistance of the water on the ship will be $b d q v^2$. Hence, when the motion has become uniform, we have,

VOL. XX.—PART I.

$$(w - v)^2 p a = b d q v^2$$

$$\therefore w = v + v \sqrt{\frac{b d q}{a p}} = \left\{ 1 + \sqrt{\frac{b d q}{a p}} \right\} v$$

The velocity v of the ship therefore will be,

$$v = \frac{w}{1 + \sqrt{\frac{b d q}{a p}}}$$

Case 2. As to the motion of a vessel in a side wind, the problem is somewhat more complicated.

Suppose AB (Pl. 2, Fig. 2) to be the keel, C the centre of the mast, DH the yard, trimmed square, WC the direction and velocity of the wind, and CE the velocity of the ship. Then, relatively to the ship, the direction of the wind on the sail will be in the diagonal YC , and Cf will be the direction of her vane when in motion, though Cg will be its direction when at rest; this apparent change or heading of the wind when a ship is in motion is familiar to seamen. Now, since the wind, YC , acts obliquely on the sail, DH , we must reduce its direct impulse in the ratio of the square of the sine of obliquity. Draw HK parallel to YC , and DK perpendicular to HK ; also draw KL perpendicular to DH , then DK will be as the number of particles striking the surface of the sail, and the perpendicular action will be represented by KL . The other portion of that force acting parallel to the face of the sail, and perpendicular to the keel, can have no effect on the progressive motion of the ship, except that its friction, or the bagging of the sail, may tend to carry the vessel to leeward, which we do not at present consider, looking on the sail as a plain surface. Draw the perpendicular YG , then CG is the sine of obliquity YC , and the impression of YC is as the square of CG .

Preserving the same notation as before, we have $CE = v$, $WC = w$, $EG = w$, $\sin GYE = w$, $\sin WCH$, and $CG = EG - EC = w \sin WCH - v$; and since the impulse = $a p \left\{ w \sin WCH - v \right\}^2$, where a = area of sail, and p the impulse on the square foot, we have,

$$a p \left\{ w \sin WCH - v \right\}^2 = b d q v^2$$

$$\text{and } w \sin WCH = \left\{ 1 + \sqrt{\frac{b d q}{a p}} \right\} v$$

$$\left\{ 1 + \sqrt{\frac{b d q}{a p}} \right\}$$

$$\text{and } w = \frac{\sin WCH}{w \sin WCH} \times v$$

$$\text{or } v = \frac{w \sin WCH}{1 + \sqrt{\frac{b d q}{a p}}} \times \frac{w \sin WCH \sqrt{a p}}{\sqrt{a p} + \sqrt{b d q}}$$

which is precisely the former result, reduced by the sine of obliquity.

In either of these cases, it may be perceived that the coefficient of v being constant, w and v

are proportional to each other, the velocity of the ship with the same sail is proportional to the velocity of the wind. But the quantity a , expressing the area of sail, being under the radical sign, the velocity of the ship, the wind remaining the same, will be as the square root of the area of sail; so that to procure a double velocity, four times the area of sail is required.

Case 3. But it is not usual to keep the yards square when the wind is oblique to the course; a considerable portion of the wind that might be intercepted would be lost; and if the wind were before the beam, the sails would be taken aback.

Besides, ships exposing more surface of sail when their sides are exposed to the wind, are enabled to make up for the loss of power occasioned by the obliquity of action.

Let the sail DH (Fig. 3) be trimmed obliquely: it is evident, that since the impulse of the wind must be perpendicular to the sail, the vessel will not move in the direction of her length AB , but in some other line to leeward of it, as CE . Her head therefore must be kept to windward of her intended course; the amount of this deviation,—viz., the angle BCE is called the lee-way. If the ship were a round tub, to be equally moveable in all directions, and fitted with a mast and sail in the centre, it is clear that if prevented from turning round, it would move in the direction CL perpendicular to the yard. But being from the construction much more easily moveable in the direction of the length than the breadth, the course of a ship will be somewhere between CL and CB ; and whatever be the amount of the impulse on the sail in the direction CL , the angle of lee-way, BCE , will remain the same, for the impulse of the resisting surfaces will still be proportionate; and this impulse must be in the direction CL , so long as the yard remains in the same trim. Whatever may be the direction of the wind, it follows therefore that the lee-way depends on the shape of the vessel and trim of the sails, not considering the effect produced by the action of the wind on the hull and rigging, which, when the quantity of sail carried is small, becomes a very important part of the whole impelling power. If we knew the proportionate resistance made to longitudinal and transverse motion, we could ascertain the lee-way for any angle of impulse. But we have seen that the resistance on the sides, if calculated according to the theory, would not present us with a true result, since the action of the fluid on them in this case would be very oblique. In common vessels, besides, the form cannot be reduced to an equation, and the surfaces of action change with every variation in the direction of the impelling power. As matter of fact it is known that a good-sailing ship, with all her sails in action, will not make more than from 5° to 12° lee-way. The amount increases as she is obliged to take in her sails, and in the shallow vessels employed in inland navigation, the lateral resistance being less in proportion, the lee-way must in general be greater. Hence the adoption of lee-boards, sliding-knots, &c., which increase the lateral resistance, without diminishing much the direct motion. But, to proceed in the investigation

before us, take CE to represent the motion of the ship, WC that of the wind, then the diagonal YC will be the relative direction and force of the wind on the sail DH , and its impulse, as in the former case, will be represented by the square of CG . Draw the perpendiculars ME and WK ; then, because of parallels, $mC = GK = EC$. $\sin ECH$, and $CK = CW$. $\sin WCB$; and with the former notation $EC = v$, $WC = w$; then $CG = CK - GK = w \sin WCH - v \sin ECH$; and the impulse on the sail will be—

$$ap \left\{ w \sin WCH - v \sin ECH \right\}^2$$

Now, the vessel moving uniformly, this impulse will be equal and opposite to that produced by the resistance to the ship's side, in the direction LC , when the ship is moving with the velocity and direction CE . Let CL represent this impulse, or that of the wind on the sail, and resolve it into CM and ML , of which CM will represent that part effective in the direction BA , and ML that in the transverse direction, when sailing with the lee-way BCE : putting $s =$ surface or side of the ship exposed to the action of the water in the direction CL ; qs will be the impulse of the water on it—

$$\text{and } ap \left\{ w \sin WCH - v \sin ECH \right\}^2 = qs^2$$

$$\text{or } w \sin WCH = v \left\{ \sin ECH + \sqrt{\frac{qs}{ap}} \right\}$$

$$\text{and } w = v \left\{ \frac{\sin ECH + \sqrt{\frac{qs}{av}}}{\sin WCH} \right\}$$

$$\text{or } w : v = \sin ECH + \sqrt{\frac{qs}{ap}} : \sin WCH$$

Where, by diminishing ECH , that is, by trimming sharp, and enlarging a the quantity of sail in proportion to s the side exposed to the water, the third term of this proportion may be less than the fourth, and consequently that the velocity of the ship may exceed that of the wind.

SEC. II.—IMPROVEMENTS IN PRACTICAL CONSTRUCTION.

In the present state of naval architecture, it is hardly possible to offer observations on any part of a ship's construction, without associating with those remarks the name of sir Robert Seppings, the late Surveyor of the Navy, who has, within a period of about fifteen years, effected a complete revolution in the principles of practical construction; so much so, indeed, that two distinctive appellations are now commonly applied to particularise his from the former mode of ship-building—the “new, or diagonal system,” and the “old system.”

Of all large machines destined to undergo severe shocks, a ship, is perhaps, the least skilfully and artificially contrived. The frame of a seventy-four gun ship, constructed on the old principle, is formed of more than eight hundred different timbers, placed at right angles to the keel, which may be considered as the back-bone of an animal, and the frame timbers its ribs. Each rib is composed of several pieces, of the thickness of fourteen inches, or thereabouts.

Between the several divisions of the frame, or ribs, is a space from one to five inches wide. The whole exterior frame is covered with planks of different thicknesses, or, to carry on the figure, the ribs are covered by a skin of greater or less substance, from the extreme ends of them to the keel or back-bone. The inside of the frame is also almost entirely lined with planks; within which is another partial range, as it were, of interior ribs, at a considerable distance from each other, termed *riders*. Across this frame are pieces of timber called beams, united together so as to be of sufficient length to reach from one side of the ship to the other.

The use of these beams is to secure the sides of the ship so as to prevent her upper works from spreading, and to keep that part which is under water from being compressed by the fluid. They are also the supports or bearers of the decks, (or what we call in houses the girders for the floors), and must, therefore, be of such strength as to endure the weight of the cannon, and whatever else is to be placed upon them. The usual mode of fastening these to the sides, has, generally speaking, been merely local, by two angular pieces of timber or iron (called *knees*) bolted to each beam, and also to the sides of the ship, by which means they were only partially held to the side, and there was wanting that continuity of materials, and consequently of strength, which the new system gives. Between the beams, and at right angles with them, are placed pieces of wood called *carlings*, and at right angles with these, (consequently parallel to the beams,) ledges, which correspond with joists in a house. The planks or flat of the deck (flooring) is laid nearly in parallel lines from head to stern, upon and at right angles with the beams, and is fastened to them, and to the carlings and ledges, by bolts, nails, or wooden pins, called *treenails*. It will thus appear evident that the decks, according to the old construction, are in nowise connected with the sides of the ship.

From this sketch, it will be perceived, that all the materials composing the fabric of such a ship are disposed nearly at right angles to each other. This disposition, which, in every wooden fabric is well known to the meanest mechanic to be the weakest, is particularly so in a ship, the immense body of which, subject to violent action from impulses in every direction, is sustained by a greater pressure on the centre than the extremities, arising chiefly from the difference in the fore and after parts of the body to that of the midship, or middle part. From the want of a continued succession of support from the centre to the extremities originates the tendency to arching, or hogging. This tendency shows itself in a ship from the moment of her launching; when it is invariably found that the two extremities, being less supported by the water than the middle, drop, and give to the ship a convex curvature upwards in the direction of her length, an effect, which from its resemblance to the shape of a hog's back, is usually termed *hogging*. In very weak or old ships, it may be traced in all the port-holes of the upper deck, by their having taken the form of lozenges, declining different

ways from the centre of the ship to each extremity.

To discover the law which influences a ship when floating quiescently in the water, we may suppose the vessel to be divided into vertical sections of an indefinitely small constant thickness, perpendicular to a vertical longitudinal plane. If we commence our consideration at the stern, and advance gradually forward, it is evident that the sections comprising the counter and its connecting parts, being free from the water, will be subject to no re-action from it; and when at last any re-action does take place, it must be at first, from the peculiar form of the body, be infinitely less than the weight of the section whose displacement occasions it. As we approach, however, the midship section of the vessel, the upward pressure of the fluid will approximate more and more to an equality with the weight of its corresponding section, and ultimately become equal to it; and if we pass beyond this section, which may be denominated the section of hydrostatic equilibrium, we shall find the weight of the water displaced, become greater than the weight of the section above it. In like manner, if we commence at the bow of the vessel, we shall find a similar section of hydrostatic equilibrium, and afterwards a like increase of the weight of the water displaced above that of the section reposing on it.

In Dr. Young's "Remarks on the Employment of Oblique Riders," inserted in the Philosophical Transactions for 1814, he gives the following as the results of his calculations on the distribution of the forces operating on the hull of a seventy-four gun ship, fitted for sea, whose length is 176 feet, and breadth 47½.

TABLE IV.

Distance from the stern.	Weight of the Sections.	Pressure of their Displacement.	Difference of weight and pressure.
.. 49	+ 699	— 627	+ 72
Next 20	+ 297	— 405	— 108
.. 50	+ 1216	— 1098	+ 118
.. 20	+ 290	— 409	— 119
.. 37	+ 498	— 461	+ 37
176	+ 3000	— 3000	= 000

Dupin in his paper *De la Structure des vaisseaux Anglais*, in the Transactions for 1817, has given an elaborate analytical view of this subject, and has furnished the different equations on which the whole problem of arching depends; from which he deduces the following theorems.

I. That when a vertical plane divides a vessel into two parts, so that the weight of each is equal to the weight of water displaced by it, the moments of those parts estimated in relation to the same plane, to produce what is denominated arching, will be either a *maximum* or a *minimum*.

II. That this effect will be a *maximum*, when the infinitely small section contiguous to the plane of the moments, has its own moment in a contrary direction to the total moment.

III. That the effect will be a *minimum* when this section has its own moment acting in the same direction as the total moment.

These theorems are applied by Dupin to the distribution of the forces in a seventy-four gun ship, the numerical elements relating to the weights and displacements being derived from the paper above mentioned of Dr. Young. We must, however, observe that the causes of arching are not be attributed entirely to the unequal distribution of the weight and pressure, but that the partial horizontal pressure in a longitudinal direction of the water, also contributes to this alteration of form, affecting the lower parts of the ship only, and tending to compress and shorten the keel, while it has no immediate action on the upper decks. The pressure thus applied, must obviously occasion a curvature, if the angles made with the decks by the timbers, be supposed to remain unaltered, while the keel is shortened in the same manner as any soft and thick substance pressed at one edge between the fingers, will become concave at the part compressed; and this strain upon the most probable supposition respecting the comparative strength of the upper and lower parts of the ship, must amount to more than one-third as much as the mean value of the former, being equivalent to 1000 tons, acting on a lever of one foot in length, while the strain, arising from the unequal distribution of the weight and displacement amounts where it is greatest, that is about 37 feet from the head, to 5260 in a seventy-four gun ship of the usual dimensions; and, although the strain is considerably less than this exactly in the middle, and throughout the aftermost half of the length, it is no where converted into a tendency to "sag," or become concave.

In addition to these forces as operating to produce arching, we must take into account the action of the waves; for the magnitude of the strain on the different parts of a ship is subjected to very material alterations when she is exposed to the forces of the wind and waves. The effect of the wind is generally compensated by a change of the situation of the water line or line of floatation, so that its amount may be estimated from the temporary or permanent inclination of the ship; and the force of the waves may be more directly calculated from their height and breadth. These two forces can seldom be so applied as to combine their effects in producing a strain of the same kind in their full extent; it will, therefore be sufficient to determine the probable amount of the force of the waves, which is more materially concerned in affecting the longitudinal curvature than that of the wind. As a fair specimen of the greatest strain that is likely to arise from this cause in any common circumstances, we may consider the case of a series of waves twenty feet in height, and seventy in breadth; the form being such that the curvature of the surface may be nearly proportional to the elevation or depression; a single wave might indeed act more powerfully than a continued series, but such a wave can scarcely occur singly. We shall then find upon calculation, that the greatest strain takes place in a seventy-four gun ship at the distance of about eighteen feet from the midships, amounting to about 10,000 tons; at the instant when the ship is in a horizontal position, while in more common cases, when the waves are nar-

rower, the strain will be proportionably smaller and nearer to the extremity. Hence it appears, that the strain produced by the action of the waves, may very considerably exceed in magnitude the more permanent forces derived from the ordinary distribution of the weight and pressure, being according to this statement nearly three times as great; so that when both strains co-operate, their sum may be equivalent to about 15,000 tons, acting on a lever of one foot, and their difference in opposite circumstances to about 5000. It may also be remarked, that the pressure of the water against the sides of a ship has a tendency to cause a curvature in a transverse direction, which is greatly increased by the distribution of the weight, the parts near the sides being the heaviest, while the greatest vertical pressure of the water is in the neighbourhood of the keel.

To correct the alterations of form arising from the action of these various forces, has been the great object of the labors of Seppings. As we have before observed, the manner in which the principal materials composing the hull of a ship is inartificial in the extreme; the ribs form a right angle with the keel, the inside and outside planks are at right angles to the ribs, the beams at right angles to these, the carlings the same to the beams, the ledges to the carlings, and the planks of the decks to the ledges, the beams, and the ribs. The weakness of a disposition of this nature, may be illustrated by putting together four pieces of wood, and securing them by iron pins at the four corners, in the form of a square or parallelogram; this, on the least pressure, may be made to change its form to the rhombus. But, let another piece be fixed, to it diagonally, and the figure of the frame will be found immovable. Place a bar in the middle parallel to two of the sides, and secure it firmly by iron pins, still the figure will be easily moved by the hand, like a parallel ruler, and assume the rhomboidal shape of A (PL. 3, FIG. 1), or B, (PL. 3, FIG. 2); but, apply to the frame where carpenters term the brace in a common field gate, as Z (FIG. 3), and the figure will remain as before, immovable. If this brace or diagonal piece be not fitted to it, the outer part of the gate (or that part most distant from the hinges) will have a constant tendency downwards, until at length it will reach the ground.

Let FIG. 4 and 5, represent two frames of wood composed of parts strongly connected by bolts or iron pins, of which the former is put together on the old, and the other on the new principle. Let C C represent a fulcrum or point of support, and D D be two weights, to be attached to the extremities for the purpose of ascertaining the comparative strength and stiffness of each frame. This experiment will show that the stiffness of FIG. 5 is to that of FIG. 4, as 6 to 1, and the strength as 3 to 1; and the greater the length of the frames, the more manifest will be the decided advantage of the new principle, as respects both of those qualities. The substitution of the triangle, as in the frame, FIG. 5, the rectangle in the frame, FIG. 4, comprehends the principle of the new system, which consists in the application to the ribs or timbers of the ship from one ex-

tremity to the other, and from the orlop deck downwards to the keelson, a series of diagonal braces disposed in the form of triangles, the sides of which give to each other a mutual support and counteraction. These triangles are firmly bolted to the frame; and in order to give a continuity of strength to the whole machine, and leave no possible room for play, the spaces between the frames were filled up originally with old seasoned timber, cut into the shape of wedges, but recently, with a prepared cement, thus rendering the lower part of a ship, one solid complete mass, possessing the strength and firmness of a rock.

The same principle of trussing is carried from the gun-deck upwards, from whence, between every port, is introduced a diagonal brace, which completely prevents the tendency of ships to stretch, or draw asunder their upper works. The decks, too, are made subservient to the securing more firmly the beams to the sides of the ship, by the planks being laid diagonally in contrary directions, from the midships to the sides, and at an angle of 45° with the beams, and at right angles with the ledges. In frigates and smaller vessels, iron plates lying at an angle of 45° , with the direction of the trusses, are substituted for the diagonal frame of wood in ships of the line.

By this mode of construction the ceiling, or internal planking, is wholly dispensed with, and a very considerable saving of the finest oak timber thereby effected; and what is more important, those receptacles of filth and vermin between the timbers, which were before closed up by the planking, entirely got rid of. This is not the least important part of the improvement, either as it concerns the soundness of the ship, or the health of the crew. It is stated that a ship which had been three years in India, on being laid open, exhibited a mass of filth, mixed up with dead rats, mice, cockroaches, and other vermin, which was taken out in cakes, not unlike in appearance, the oil-cakes with which certain animals are fed; that the stench was abominable, and the timbers with which it was in contact rotten. No such filth can find a lodgement in ships of war as they are now built.

The first ships of war on which the new principle was tried were those rebuilt or repaired in docks, from which they were quietly floated out without any shock from launching; several of them sustained several gales of wind, without showing the least symptoms of weakness, but quite the contrary, not even a crack appearing in the white-wash with which their sides within were covered. If these experiments were not satisfactory, the launching of two of the largest ships in the navy established the fact of superior strength beyond the possibility of a doubt—the Nelson and the Howe. The Nelson, constructed on the old principle, was probably in every respect the best built ship in modern times; the timber sound and well-seasoned; the workmanship admirable; no pains were omitted by Mr. Sison, the builder, to have her as perfect as she could be made; and her motion, when launched from the stocks, was slow, easy, and majestic, without a shake or a plunge; yet the Nelson, after launching, was found to have arched no less than $9\frac{1}{2}$ inches. The Howe is a sister ship

to the Nelson, but built on the new principle; and after launching she was found to have arched only $3\frac{1}{2}$ inches. The St. Vincent, built on the old principle, and otherwise the same in every respect as the Howe, likewise hogged on launching $9\frac{1}{2}$ inches, and the whole fabric in both cases, was found on examination to be greatly disturbed; whereas, the Howe exhibited no such symptoms. Fig. 6, Plate III. will show the mode of trussing ships of the line according to the plans of Sir Robert Seppings, now almost universally adopted in the British Navy.

By the same individual a great variety of other improvements in the different parts of the construction of a ship have been proposed and introduced into general use in the navy. It was he who, in 1807, first suggested the plan of rounding the form of the bow in ships of the line, which is considered by nautical men of great utility and importance, and has been since generally adopted. The removal of the head-railing, and the continuing of the rounded form, give not only great additional strength, but also much more comfort and convenience to the crew, and security in that part of the ship when in action.

The scarcity of compass, or crooked timber, was for some time attended with serious injury to those ships of war while on the stocks into which it was considered necessary to be introduced. The difficulty with which it was procured, the length of time which a ship sometimes remained on the stocks, waiting for a few pieces of compass timber, and the necessity of adding immediately the green wood when found, to the seasoned timber in other parts of the frame, gave to the ship different periods of durability; though, in the long run, the seasoned parts became affected by the green wood with which they were in contact, and a premature decay of the whole fabric was the consequence. Seppings therefore proposed a plan in 1806, which, by uniting short timbers according to a method called *scarphing*, enabled him to obtain every species of compass form that could be required from straight timber. Since that period the whole frame of a ship can be prepared at once, without waiting for particular pieces, and thus every part of it be made to undergo an equal degree of seasoning.

By the same ingenious and indefatigable shipwright, a plea was proposed and adopted in the year 1813, by which ships of the line were built with timber hitherto considered as applicable only to the building of frigates, and that which had been deemed only fit for inferior uses was appropriated to principal purposes. The Talavera was the first ship built on this principle, and the expense of her hull is stated to have been about £1000 less than that of the Black Prince, a ship of similar dimensions built on the old principle. The method by which the timbers were united was found, on trial of the two ships while in frame, to give so much additional strength to the former, that it furnished the ground-work of the present mode of framing the British navy, by the introduction of the same union of materials in the application of the large as was practised in that of the

small; from which a union of strength and economy has resulted.

The building of the *Talavera*, and the great strength of her frame, led to the practice of putting together the frames of ships of the line from timbers of reduced lengths, and dispensing altogether with the chocks used for uniting their extremities, or, as they are technically termed, their heads and heels. These chocks are of the form of an obtuse wedge, as *A* (Fig. 7), and they are used to unite the two pieces of timber, as *B* and *C*, by firmly bolting the piece *A* to the two timbers *B* and *C*. It generally happened, however, that in the operation of fixing this chock its two extremities split, and the surfaces of the chock and timbers not being in perfect contact, the moisture and air were admitted, and naturally occasioned the dry-rot to exist in those parts of the ship than in most others; and, as there were from 400 to 500 of these chocks in a 74 gun ship, it will readily be conceived what mischief was done to the whole fabric, if the greatest care were not taken by the workmen to prevent their splitting, and to bring their surfaces immediately into contact. It is obvious, also, that a great deal of timber must have been cut to waste in making these chocks; in fact, they consumed in each ship timber to the value, when it was at a high price, of from £1500 to £2000, independent of the expense of workmanship, which was considerable; and when the ship came to be repaired not one chock in six was found to be in a fit state to be used again. To obviate these disadvantages, Sir Robert Seppings brought the butt ends of the timbers together, as represented in Fig. 8, and kept them in that position by means of a round dowel or coak, in a manner similar to that by which the felloes of a carriage-wheel are united. He justly observes that the simplicity of the workmanship, the economy of the conversion of the timber, and the greater strength and durability, although of considerable moment, are of trifling importance when compared with the advantage of rendering timber generally applicable to the frames of ships which had heretofore been but partially so.

Of all the designs brought forward by the distinguished individual to whom the merit of the above improvements is due, there is one which has been questioned with a keenness and severity of a very uncommon kind, and which, it may be not unfairly added, has been opposed by prejudices of no ordinary nature, we mean that of the substitution of the circular form in the sterns of war, for that at present existing. Circular sterns, when contrasted with those of a square form, may be contemplated under two points of view. In the first place we should inquire into the strength peculiar to each form, considered as a system of mechanical forces; and secondly into the means which each affords for carrying into effect the more immediate objects of a ship of war namely, attack and defence.

In the mechanical construction of a ship, every part of its structure ought to possess a proper degree of strength; no one part possessing—if such an expression may be made use of—more strength than is absolutely necessary, nor any part less strength than the nature and office of

that particular part is destined to maintain. The change which Sir Robert Seppings contemplates, and which he has actually applied to several ships, is, to communicate to the stern the strength and firmness of the bow; and to continue the diagonal system of building, which he has lately introduced, round the stern, in order to make the strength of the fabric uniform and complete. It is now universally admitted that the diagonal system has communicated great strength to every part to which it has been hitherto applied; and there seems no good reason why the same increase of strength should not be communicated to a part so notoriously weak as the present square stern, particularly when by doing so, not only the mechanical frame of the ship is materially strengthened, but its means of defence also very much increased.

In the consideration of the means which each form of the stern affords for attack and defence, the same objections may be urged against the defence of a square stern, as is known to attach to a redoubt of a square form. "Redoubts," says Malorti de Martemont, in his theory of Field Fortification, "when they are not flanked by some other fire, have two essential defects; the first is, that their salients are unprotected, which cannot be remedied but by adapting to those salients a few teeth of *cremaillere*, or, when the ground and every other circumstance will allow it, by directing the salients towards some inaccessible points, or by placing in front of them, when possible, some artificial obstacles." "But," continues Malorti, "circular redoubts have not that defect, as their fire, which has no fixed direction, may incessantly vary, and spread itself on every point of the ground that surrounds them;" and, "the defence which they present is uniform on every part of the circumference." Now the defects which this able writer attributes to square redoubts, hold, in all their force, against the defence of the square stern; while the reason he gives in favor of redoubts of a circular form, applies most favorably to ships with round sterns. It is true that the defence of the stern only includes the form of a semicircle, while the defence of the redoubt here alluded to, embraces the whole range of its circumference; still the reasoning holds good for the latter figure as well as for the perfect circle, because the chord of the semicircle, in the case of the circular stern, requires no defence.

In the case of an attack on the quarter of a ship, as by a steam-vessel for instance, of the kind just alluded to, Sir R. Seppings' plan gives a superiority, not only on account of the additional number of guns which the ship is enabled to bring into action, and the sweep of the ocean which those guns are able to command; but also an advantage of another kind, arising from the diminution of the distance of that point from the ship where the shot from the two after-guns cross each other, when the guns are trained to their greatest angle,—a point, it is presumed, of no small importance in case of an attack from a steam vessel. These united considerations tend unquestionably to prove that the circular stern is the form best capable of defence.

In concluding these remarks we may not im-

properly glance at the improvements which have of late years been introduced in the preservation of the navy. Not only is the new mode of construction highly favorable to the duration of ships, but the ravages of the disease known by the name of the dry-rot, occasioned principally by the hurry in which they were built during the late war and the unseasoned state of the timber made use of, led to such measures as tend most effectually to the preservation of the fleet.

In the first place, various modes were put in practice for assorting and seasoning the timber, and for protecting it from the vicissitudes of the weather. The oak and fir of Canada, which had been introduced to a great extent in our dock-yards, during the time the Baltic was shut against this country, are now excluded; those woods having been found not only to possess little durability, but so friendly to the growth of fungi, that they communicated the baneful disease to all other descriptions of timber with which they came in contact. The greatest of all improvements, however, for the preservation of the navy, is the roofing thrown over them while building, and in ordinary; a practice, the utility of which is so obvious that it is quite extraordinary it should not have been earlier adopted. By filling in between the timbers masses of cement, and then injecting, by forcing-pumps, a mixture of oil and tar into all the joints and crevices of the frames; and lastly by the constant care and attention bestowed on ships after leaving the dock-yard, and being placed in a state of ordinary, it may be said that the dry-rot has no longer any existence in the British navy.

A ship now placed in ordinary, whether new or newly repaired, is carefully housed over, so that no rain can reach her lower decks; several streaks of planks are removed from her sides and decks, to admit a thorough draft of air, which is sent down by wind-sails, and which pervades every part of the ship; this, with the addition of two small airing-stoves, in which a few cinders are burned, render her perfectly dry and comfortable on all the decks and store-rooms. All the shingle-ballast is removed out of the hold, which is thoroughly cleared and re-stowed with iron-ballast, which is completed by the lower tier of iron tanks being filled with pure water. The former practice of mooring two ships together, by which the two sides next to each other, deprived of the sun and a free circulation of air, were generally found to be decayed, is discontinued. The lower masts are left standing and their tops housed over; the gun-carriages and several of the stores are left on board; and such, in short, is the state of a ship in ordinary, that she may be fitted in all respects for proceeding to sea in half the time formerly required.

A practice has recently been introduced into the dock-yards, of steeping oak timber in salt water for several months, and then stacking it till it becomes perfectly dry, which is said to have entirely put a stop to the dry-rot where it had already commenced, and to act in general as a preventative to that disease. Some doubts have, however, been entertained on this point,

and the Americans seem to place but little confidence in the plan. Rodgers, the commissioner of their navy, states in an official report addressed to the secretary, that "experiments have been made to arrest the dry-rot in ships by sinking them for months in salt water, but without success. The texture of the wood was found to be essentially injured by being thus water-soaked, and it became more subject to this disease than before it was sunk. The ships were also injured in their fastenings, and the atmosphere within them was kept in a constant state of humidity, whence, among other ill effects, proceeded injury to provisions and stores, and sickness to the crews." Now we know that not one of these injurious effects happened to the *Eden*, which was sunk in Hamoaee, remained under water three or four months, was sent to India, and continued at sea for a long period; but from being covered with fungus before the operation, she has not since shown a single symptom of dry-rot. The truth is, that the American timber, with the single exception, perhaps, of the live oak, is remarkably subject to dry-rot, of which, during the late war, we had fatal experience. Mr. Knowles, in his *Treatise on the means of preserving the British navy*, is led to conclude, from a variety of experiments, "that timber is better seasoned when kept for two years and a half under cover, than when placed for six months in water, and then for two years in the air, protected from the rain and sun; that it loses more in seasoning, by having been, during the six months of immersion, alternately wet and dry, than it does from having been the whole of the time under water; and that the loss in moisture is greater in all cases in a given time, when the butt-ends are placed downwards."

The following are the most celebrated works on Naval Architecture:—*Elémens de l'Architecture Navale*, ou *Traité Pratique de la Construction des Vaisseaux*, by M. du Hamel du Monceau, an excellent work, which possesses the merit of having been the first to illustrate, in a satisfactory manner, the theory and practice of the art. *Traité du Navire*, by Bouguer. *Théorie complète de la Construction, et de la Manœuvre des Vaisseaux*, by Euler. *The Scientia Navalis*, of the same author, is a learned and conspicuous work. *Essai Géométrique et Pratique sur l'Architecture Navale*, by M. Vial du Clairbois. *Manuel de Construction Pratique*, by M. de Lironcourt. *Traité de la Construction des Vaisseaux*, by M. Dumait de Goimpy. *Examen Marítimo*, in Spanish, by Don Jorge Juane. This work contains a most excellent theory, founded on experience and practice. It has been translated into French by M. Levêque, who has added several valuable notes. *A Treatise on Naval Architecture*, in Swedish, by Chapman; translated into French by M. Vial du Clairbois, and into English by Dr. Inman, the learned professor at the Naval College, Portsmouth. To these must be added the papers of Attwood on stability in the *Philosophical Transactions* for the years 1796 and 1798; that of Steppings and of Young in those of 1814 and that of Dupin of 1817.

SHIP-CARPENTER. A ship-builder. See **CARPENTER**.

SHIPRAH AND PUAH, two midwives of Goshen, in Egypt, deservedly celebrated in sacred history, and rewarded by the Almighty himself for their humanity, in disobeying the bloody mandate of the tyrant of Egypt to murder the Hebrew boys at their birth. Exod. i. 15—19. Some commentators have expressed doubts whether these worthy women were Egyptians or Hebrews; but we think it hardly admits of a question that they were Hebrews, as otherwise their pagan superstition would have led them to comply with the royal mandate, and to think that at the same time they served their gods, by murdering the children of a race who despised their deities.

SHIP-MONEY, was an imposition charged upon the ports, towns, cities, boroughs, and counties of this realm, in the reign of king Charles I., by writs, commonly called ship writs, under the great seal of England, in the years 1635 and 1636, for the providing and furnishing of certain ships for the king's service, &c., which was declared to be contrary to the laws and statutes of this realm, the petition of right and liberty of the subject, by stat. 17 Car. I. c. 14. See Blackstone's Commentaries, vol. iv. p. 30.

SHIPWRECK, MEANS OF PRESERVING LIVES, IN CASES OF. In the Philosophical Magazine we have an account of means for preventing that loss, when the ship is in danger between 200 or 300 fathoms of the shore. The only certain means of saving the crew of a vessel in such a state is to establish a rope of communication from the shore to the ship, by fixing the end of the rope to a bomb or cannon ball, and extending the rope afterwards, in a zig-zag direction, before the mortar or cannon, or suspending it on a piece of wood raised several feet. A rope, so placed, will not break by the greatest velocity which can be given to the bomb or ball; and thus the end of it can be sent ashore by a discharge of artillery. The writer prefers the bomb to the cannon ball. He proposes, however, other means to effect his benevolent purpose. 'It ought to be remembered that a vessel is never cast away, or perishes on the coast, but because it is driven thither against the will of the captain, and by the violence of the waves and the wind, which almost always blows from the sea towards the shore, without which there would be no danger to be apprehended; consequently, in these circumstances, the wind comes always from the sea, either directly or obliquely, and blows towards the shore. 1st. A common paper kite, therefore, launched from the vessel and driven by the wind to the shore, would be sufficient to save the crew, consisting of 1500 seamen, if such were the number of a ship of war. This kite would convey to the shore a strong packthread, to the end of which might be affixed a cord, to be drawn on board by means of the string of the kite; and with this cord a rope, or as many as should be necessary, might be conveyed to the ship. 2d. A small balloon, of six or seven feet in diameter, and raised by rarified air, would be also an excellent means for the like purpose: being driven by the wind from the vessel to the

shore, it would carry thither a string capable of drawing a cord with which several ropes might be afterwards conveyed to the vessel. Had the discovery of Montgolfier produced no other benefit, it would on this account be of great importance. 3d. A sky-rocket, of a large diameter, would be of equal service. It would also carry, from the vessel to the shore, a string capable of drawing a rope after it. Lastly. A fourth plan for saving the crew of a shipwrecked vessel, is that of throwing from the vessel into the sea an empty cask with a cord attached to it. The wind and the waves would drive the cask to the shore, and afford the means of establishing that rope of communication already mentioned.

Mr. John Bell, of the royal artillery, afterwards promoted to a lieutenantancy, contrived a similar method of saving persons from stranded ships, in the year 1791, by providing a mortar between 500 and 600 weight, with a chamber, &c., capable of containing one pound of powder, and a bore to admit a leaden ball sixty pounds or upwards. When a ship is stranded, the mortar is to be elevated about 45°, and a rope or deep-sea line is to be fastened by one end to the ball, while the line itself, being coiled round parallel handspikes, may be easily and rapidly unfolded to its full extent. On the discharge of the mortar towards the shore, the ball will carry with it the line or rope, and by burying itself in the earth make that end of the rope fast, while the other end is in the stranded vessel: thus the rope becomes stretched between the vessel and the shore, and a communication thence established by means of rafts. The rafts recommended by lieutenant Bell are each formed by lashing together with ropes five empty water-casks belonging to the ship, and lying above them a seaman's chest, with holes cut in its sides, to prevent its filling, and to allow the person who rides in it better convenience for taking hold; pulleys are attached to this chest, through which the rope is to run: the raft is also to be ballasted underneath, to prevent its upsetting. The mortar and necessary balls or shells that would be used on such an occasion might form a part of the ballast of the vessel; and whenever a ship is driving or unmanageable near the shore, the mortar might be brought on deck, and the apparatus prepared. In some cases grapnels may be advantageously fired from common ordnance to answer the same purpose.

The following is a relation of some trials made before a committee of the Society of Arts at Woolwich, in August, 1791. From a boat moored about 250 yards from shore, the shell was thrown 150 yards on shore, with the rope attached to it; the shell was of cast iron, filled with lead; it weighed seventy-five pounds; its diameter eight inches; the rope in the trial was a deep-sea line, of which 160 yards weighed eighteen pounds; the angle of the mortar, from whence the shell was fired, was 45°. By means of the line, lieutenant Bell and another man worked themselves on shore upon his raft of casks; there were many links in the rope, but they were cleared with ease by lieutenant Bell, with the assistance of his match-blocks. The second trial was repeated in a similar manner, and with equal success, the

shell falling within a few yards of the former place; the gale of wind was brisk, and the water rough. The direction of the shell was nearly from north to south, and the wind blew nearly north-west. In the third trial, the mortar was elevated to 70°; the rope attached to the shell was an inch and half tarred rope, of which every fifty yards weighed fourteen pounds and a half. The shell was of the kind above mentioned; it fell 160 yards from the mortar, and buried itself about two-thirds in the ground; the line or rope run out was about 200 yards, and it required the force of three men to draw the shell out of the ground at that distance.

There can be little doubt that, in many cases when vessels are stranded near the shore, the adoption of the means pointed out by lieutenant Bell would tend to the preservation of many valuable lives; and since a suitable piece of ordnance, with a block carriage and leaden balls, would not cost above eleven or twelve pounds sterling, the expense furnishes no objection of moment. Indeed, in trading vessels, such a piece might farther answer the purpose of making signals of distress, by filling the chamber with powder, and well wadding it, when the report of the firing would be heard to the distance of some miles; and, in defence of a ship, such a gun would be highly useful, on account of the facility which its shortness gives to its loading and firing. The Society of Arts, &c., rewarded Mr. Bell, at that time a sergeant in the royal artillery, with fifty guineas for his invention: they published the particulars in the tenth volume of their Transactions, and thought it expedient again, in the year 1807, to insert a descriptive engraving that had been omitted at that time, with some farther particulars in the twenty-fifth volume. Models and drawings of the whole apparatus are reserved in the society's repository for the instruction of the public.

To save the lives of shipwrecked persons, and to rescue mariners from a watery grave, seems, even in idea, a contemplation so eminently benignant, and in its execution, to a warlike, commercial, and generous nation like this, an undertaking so truly benevolent, so extensively philanthropic, that we cannot sufficiently applaud the humanity of the inventor of an apparatus to save the lives and property of the shipwrecked mariners in the extremity of danger. As there are few in this great nautical nation that are not directly, collaterally, or generally connected with marine affairs and marine adventures, the consideration, therefore, takes strong possession of the feelings of individuals, and of society at large, by the patriotic means of protecting the lives of a class of the most important members of the latter, and giving the former, that kind of moral security, and, consequently, mental happiness, which must arise from the perusal of a small octavo volume, published by captain G. W. Manby, of the royal navy, and an honorary member of the Humane Society.

The captain informs us, that while he was stationed at North Yarmouth, in the year 1807, a place remarkable for the beautiful features its coasts present in a calm, and for the terrific

distortion of them in a storm, he had been witness to the loss of several vessels; and, after describing the dreadful catastrophe, he very appropriately observes, that,

'The horrors of shipwreck at a distance from land, a scene I had unhappily too often witnessed, suggested to me also the benefit that must result from enabling a life or pilot-boat to go over a flat beach, with facility and certainty, to the relief of sufferers. This observation was corroborated by the opinions of various residents on the coast, whose assurances gave evidence, too conclusive, of the many lives and immense property annually lost for the mere want of the means I have hinted at: the chief difficulty was, that no boat could be forced over a high and raging surf without some powerful artificial aid. Among other desiderata that have grown out of my researches in this ardent and important work, there is one I presume to think of much worth. Boats, in common, where occasion has required their being launched in cases of shipwreck, have often failed, owing to their want of buoyancy, and other properties of the life-boat. I have devised a simple method of giving to every kind of boat these advantages, and at a most inconsiderable expense. Thus every vessel provided with a boat so prepared, would possess within herself the power of preserving the life of any person fallen or washed overboard, in a high wind and heavy sea; and boats around the coast, by the same means, may be converted into life-boats.'

From this benevolent idea, this treatise, in which captain Manby has reduced theory to practice, has emanated; and we are gratified to find, that parliament has, 'in the most liberal manner,' been pleased to countenance his undertaking. 'And why,' he philanthropically observes, 'may not the glorious cause of humanity be fostered on foreign shores? It would be heart-cheering indeed to learn, that the invention of an Englishman had been adopted for the salvation of the shipwrecked in every clime, and on every coast!'

This work contains representations of the apparatus, with directions for using it in the assistance of persons on board stranded vessels on a lee-shore, in the day, as well as in a similar situation at night.

SHIPWRIGHT. The company of shipwrights was instituted in the reign of James I., and consisted of a master, two wardens, and sixteen assistants. It appears in the twelfth volume of the *Archæologia*, that Mr. Phineas Pett, who had been educated at Emanuel College, Cambridge, and afterwards served his apprenticeship in Deptford dock-yard as a shipwright, was appointed master-shipwright at Woolwich dock-yard, in November 1605. He was elected and sworn master of the shipwright's company in April 1606, and their meetings were then held at the King's Head, in New Fish Street. That a new charter was granted in 1612 for incorporating the shipwrights of England, when Mr. Pett appears also to have been ordained the first master. According to Derrick's *Memoirs of the Royal Navy*, he became an assistant commissioner in February, 1630, and a principal commissioner

of the navy in December following. In 1637, by order of Charles I., he built the famous ship named the *Sovereign of the Seas*, the largest that had ever been built in England; she was afterwards cut down and called the *Royal Sovereign*.

In Pepy's *Naval Minutes* it is mentioned 'that Shipwright's Hall did anciently view and approve of the draught of the ships that were to be built for the king; and by the lord high admiral's warrant, dated in April, 1638, carpenters were not to be appointed to ships until they had been examined and licensed at Shipwrights' Hall. It appears from Mr. Pett's Manuscript in the British Museum, that it was customary, in his time, to hire and victual the shipwrights and caulkers on any emergency, and to discharge them when the work for which they were employed was performed. It also appears that there was at that time a small permanent establishment of artificers for ordinary service in each of the dockyards. Previous to the year 1691 the master shipwrights and artificers at our naval ports were borne on board one of his majesty's ships of war, fitted up purposely for their reception. The average number employed in the several dock-yards in the year 1700, were about 1780; and in 1800 the number of shipwrights were 3776, an increase by no means proportionate to the augmentation of the number of ships and tonnage of the navy during that period, which may be accounted for in some degree by the increased quantity of work that is now performed by any given number of artificers in that class, and by the great saving of labor from the introduction of coppering and copper-bolting of ships, as they do not now require docking near so often as formerly, in order to have their bottoms cleaned and their bolts replaced; for the copper bolts do not decay as the iron bolts did.

Under the description of shipwrights are included the persons employed in the occupations of mast-making and boat-building, which in private concerns are generally considered as separate branches: but in our dock-yards, the execution of such work is under the direction of distinct officers, denominated master mast-maker, and master boat-builder. The shipwrights are formed into gangs or companies, over whom officers, called quartermen, are placed; each of those gangs, according to the directions of the Navy Board, should consist of twenty men and six apprentices: but the apprentices depend on the proportion they bear to the working shipwrights. The quartermen have the selection of their respective companies; each, according to his seniority, nominating one man in turn, beginning with those who have apprentices.

The artificers and laborers in our dock-yards, when hurt in his majesty's service, are attended by the surgeons, and are allowed 2s. 1d. per day, whatever class they belong to, for six weeks, unless they are able to resume their labor at a shorter period. There is likewise an establishment of superannuation for the different classes, to which they are admitted, if rendered incapable of labor from hurts received, or after an uninterrupted service of thirty years.

A MASTER SHIPWRIGHT is a superior officer

appointed to each of his majesty's dock-yards, to superintend and direct the building and repairing of the different classes of ships, &c. He has the direction and superintendence of nearly the whole operative business of the dock-yard to which he is appointed; in the execution of which he is assisted by other subordinate professional officers, termed 'Assistants to the master shipwright;' one of whom is particularly entrusted with the management and conversion of timber, and is styled 'timber master,' who has also an assistant for measuring all the timber taken into the yard. It is likewise his duty to inspect the quality of all stores received from contractors, which are used in his department, and to attest their fitness for the service; to survey and value all vessels hired or purchased into his majesty's navy; to keep an account and certify to the navy board the quantity of all works performed by contract in the dock-yard; and to keep an account of the earnings of the respective artificers under his superintendence, and to certify the amount from time to time to the clerk of the check. Over the shipwrights and caulkers, an assistant is appointed, who conducts and directs the execution of the work, which is also considered under the superintendence of the master shipwright.

THE FOREMAN OF THE SHIPWRIGHTS, is one of a class of officers between the quartermen and shipwright's assistants, whose duty it is to direct and superintend the building and repairing of ships, and the several works in the docks. There are also foremen afloat, who are appointed to survey and report to the master shipwright the state and condition of the ships and vessels afloat.

THE SHIPWRIGHTS' APPRENTICES, in his majesty's dock-yards, are boys bound to certain persons under the direction of government, for a term of seven years, who, in the course of their apprenticeship, are instructed by some of the deserving shipwrights, in the art of building, caulking, and repairing ships and vessels. They are now divided into two classes, viz. the superior and inferior.

Superior class. By the king's order in council, September 20th, 1809, a superior class of shipwrights' apprentices, consisting of twenty-five young men of liberal education, has been established at the royal navy college in Portsmouth dock-yard: and on the 5th of November, 1810, the principal officers and commissioners of his Majesty's navy, gave notice that a plan of education had been established for them. The number of students in this class was at first limited to twelve, but have gradually increased to twenty-five.

The period of apprenticeship is seven years, but for a student who may have previously served in an inferior class of apprentices in his majesty's yards for the space of two years, it is only six years, and only five years for a student who may have previously served in the said class for the space of three years. An instructor in the theory of naval architecture is added to the present establishment of the Royal Naval College, to assist particularly in the instruction of the superior class of apprentices.

SHIRA, a river of Scotland, in Argyllshire, which rises in the mountains behind Inverary, and after forming a small lake called Loch Dub falls into Loch Fyne, near Inverary. It gives name to the valley of Glenshira, through which it runs. Its name, in the Gaelic, is Sio-reidh, i. e. always smooth, the opposite of Ao-reidh, i. e. never smooth. See **AO-REIDH**.

SHIRAZ, the capital of Fars, a noted city of Persia, esteemed the second in the kingdom, is situated near the ruins of the ancient Persepolis. The distant view is rather pleasing than grand, although much enriched by the lofty domes of the mosques, seen among the trees: on entering the town the houses are found to be small and the streets narrow, and the stranger is impressed with but a mean idea of the place which was long esteemed the second city in the empire. It was the residence of Kurim Khan, and bears evident marks of his munificence. It enjoys a salubrious climate, and its environs have been celebrated by several eminent men, among whom was Hafiz, the Anacreon of the east, who was a native of this city, and whose tomb is about half a mile from it. Without the city are several avenues, leading to beautiful gardens, perfumed with flowers, and refreshed by fountains. The population is about 40,000, and the commerce extensive. It has increased of late years, and is principally carried on with Bushire, Yezd, and Isfahan. Its mosques and other public buildings are more numerous than those of Teheran; and the great bazaar, built by Kurim Khan, is a noble structure, in which the different trades of the city have their respective stations assigned them. See **PERSEPOLIS**.

SHIRE, *n. s.* Sax. *scip*, from *scipan*, to divide. A division of the kingdom; a county; so much of the kingdom as is under one sheriff.

His blazing eyes, like two bright shining shields,
Did burn with wrath, and sparkled living fire;

As two broad beacons, set in open fields,
Send forth their flames far off to every shire.

Faerie Queene.

The noble youths from distant shires resort. *Prior.*

SHIRE is the same with county. See **COUNTY**. County, comitatus, is plainly derived from comes, the count of the ancient Franks; that is, the earl or alderman (as the Saxons called him) of the shire, to whom the government of it was entrusted. This he usually exercised by his deputy, still called in Latin vice-comes (whence viscount), and in English the sheriff, or shire reeve, signifying the officer of the shire; upon whom, in process of time, the civil administration of it totally devolved. See **SHERIFF**. In some counties there is an intermediate division between the shire and the hundred; as lathes in Kent and rapes in Sussex, each of them containing about 300 or 400 a piece. These had formerly their lathe-reeves and rape-reeves, acting in subordination to the shire-reeve. Where a county is divided into three of these intermediate jurisdictions, they are called trithings, which were anciently governed by a trithing-reeve. These trithings still subsist in the large county of York, where, by an easy corruption, they are denominated ridings; the north, the east, and the west riding.

SHIRL, or cockle, in mineralogy. See **COCKLE**.

SHIRLEY (Selina), countess of Huntingdon. See **HUNTINGDON**.

SHIRLEY (Henry), an English dramatic writer of the seventeenth century, who wrote a number of plays, but only one of them seems to have been printed, viz. *The Martyred Soldier*, in 1631.

SHIRLEY (James), another eminent English dramatic writer, said to be elder brother to Henry. He was born in London, in 1594, and educated at Merchant Tailor's school, whence he removed to St. John's College, Oxford. He published thirty-nine plays at different times; a volume of Poems in 8vo. 1656; and three Treatises on Grammar. He died in 1666.

SHIRT, *n. s. & v. a.* } Sax. *reýne, reýmic*;
SHIRTLESS, *adj.* } Dan. *shiert*; Goth. and Swed. *skut*. The under linen garment of a man to cover with a shirt: wanting this useful garment.

Shift a shirt: the violence of action hath made you reek as a sacrifice. *Shakespeare. Cymbeline.*

I take but two shirts out with me, and I mean not to sweat extraordinarily. *Id. Henry IV.*

When we lay next us what we hold most dear,
Like Hercules, envenomed shirts we wear,
And cleaving mischiefs. *Dryden.*

Ah! for so many souls, as but this morn
Were clothed with flesh, and warmed with vita-
blood,

But naked now, or shirted but with air. *Id.*

Linsey-woolsey brothers,
Grave mummies! sleeveless some, and shirtless
others. *Pope.*

Several persons in December had nothing over their shoulders but their shirts. *Addison on Italy.*

SHIRVAN, a province in the north of Persia, the largest and most important division of southern Caucasus. It is a triangular peninsula, the point of which stretches into the Caspian; varying extremely in breadth, which, at the extremity of the peninsula, is scarcely sixteen miles, while in the interior part it amounts to 160. It is bounded on the north and east by Georgia and Daghestan: on the south by the Kur, which separates it from Ghilan and Aderbijan. The northern part consists of an extensive plain, enclosed by the mountains that extend towards the sea near Derbend. Numerous streams from the mountains contribute towards the fertility of this plain, at the same time that they render the passage of an army difficult. The plain is interspersed with small woods and clumps of bushes, and the villages surrounded with orchards, vineyards, and mulberry plantations. The second division of Shirvan extends from the coast to the plain watered by the Kur, and is bounded by a higher range of mountains, which run in a south-east course through the province. The higher districts are here the most fertile. The plain along the Kur is about 140 miles in length, and from forty to fifty in breadth. It is in a great degree surrounded with mountains, and being exposed to frequent inundation, is greatly overgrown with rushes. The most elevated tract in Shirvan is that which extends towards Lesghistan. It is intersected by narrow

valleys, in many of which are small lakes, which continue filled in the greatest heat of summer. Shirvan may in general be esteemed fertile, being watered by numberless rivers, some of which fall into the Kur, and others into the Caspian. This province was annexed to the Persian empire in 1500, by Shah Ismael, and continued subject till the decline of the Sefi dynasty. Recently, however, the Russians have obtained possession of all the sea coast. The principal towns are Schamachi and Baku.

SHISHAK, **SESAC**, or **SESACUS**, a king of Egypt, mentioned in Scripture, and believed by Sir Isaac Newton and others to be the same with Sesostris. Some commentators suppose him, with great probability, to have been the brother of Solomon's queen; and that, being offended with his brother-in-law for dishonoring his sister by his subsequent marriages, he had the more readily given encouragement and protection to Jeroboam, though he did not choose to venture a war with such a powerful monarch as Solomon. This appears the more probable from Shishak's conduct after his brother-in-law's death; for having in the fifth year of Rehoboam raised a great army of 60,000 horsemen, 1200 chariots, and an innumerable multitude of Egyptians, Ethiopians, Lybians, &c., he invaded Judah, took Jerusalem, and plundered the palace and temple of their most valuable articles; while he allowed his ally Jeroboam to enjoy his newly acquired kingdom in peace. See 1 Kings, xiv. 25, 26; and 2 Chron. xii. 2—9. See also **EGYPT** and **ETHIOPIA**.

SHITAKOONTHA, a name of a Hindoo deity Siva. It means the blue-throated; and the fable accounting for the name is often alluded to in the writings of that people. When the ocean was churned, we are told, poison was produced among the fourteen precious articles resulting from that operation. The word, as well as poison, means medicinal drugs. This was swallowed by Siva: and, in the songs of Jayadeva, translated by Sir W. Jones, in praise of Vishnu and Lakshmi, under their names of Krishna and Radha, the following passage occurs (Héri and Narayana, we should premise, are names of Vishnu; and Padma, or the *Lotos*, of Lakshmi):—
‘Whatever is delightful in the tones of music; whatever is divine in meditations on Vishnu; whatever is exquisite in the sweet art of love; whatever is graceful in the fine strains of poetry;—all that let the happy and wise learn from the songs of Jayadeva, whose soul is united to the foot of Narayana. May that Héri be your support who expanded himself into an infinity of bright forms, when, eager to gaze with myriads of eyes on the daughter of the ocean, he displayed his great character of the all-pervading deity, by the multiplied reflections of his divine person in the numberless gems on the many heads of the king of serpents, whom he chose for his couch: that Héri who, removing the lucid veil from the bosom of Padma, and fixing his eyes on the delicious buds that grew upon it, diverted her attention by declaring, that when she had chosen him as her bridegroom, near the sea of milk, the disappointed husband of Parvati drank in despair the venom which dyed his neck

azure. Jones's Works, vol. x. As. Res. vol. iii.

SHITT'AIL, *n. s.* } Heb. A sort of precious
SHITT'IM. } wood, of which Moses made the greatest part of the tables, altars, and planks, belonging to the tabernacle.

Bring me an offering of badgers' skins and *shittim*-wood. *Exodus.*

SHITTIM WOOD is supposed to be the wood of the Acacia, which is the only tree that grows in Arabia Deserta. Jerome says it resembled the wood of the white thorn. See **CRATEGUS**. It is said to have been almost incorruptible.

SHITTLECOCK, *n. s.* Commonly, and perhaps as properly, shuttlecock. Skinner derives it from Teut. *schütteln*, to shake; or Sax. *reccan*, to throw; and thinks it is called a cock from its feathers. Perhaps it is properly shuttlecock, a cork driven to and fro, like the instrument in weaving, and softened by frequent and rapid utterance from cork to cock.—Johnson. But see **SHUTTLE**. A cork stuck with feathers, and driven by players from one to another with battledoors.

SHIUMLA, **CHOUMLA** or **SHUMLA**, a Turkish fortress in the mountains of the Balkan. Varna and Choumla are called, on account of their great military importance, *the gates of Constantinople*. The town of Choumla, properly so called, is nearly surrounded by a natural rampart, consisting of a portion of mount Hæmus, or the Balkan. The steep slopes of this great bulwark are covered with detached rocks, and close, thorny bushes. The nature of the ground makes it a very advantageous position for the Turkish soldier, who, when sheltered by the inequalities of the ground and a few entrenchments, displays great resolution and address. The town is about a league in length and half a league in breadth, and may contain from 30,000 to 35,000 souls. The fortifications are rudely constructed, but its situation in the midst of a vast natural fortress, capable of containing an immense army, with its magazines, &c., secures it from the enemy's artillery. The air is very healthy in the elevated parts of the Balkan, and in the narrow valleys which lie between its ridges. On the other hand, there cannot be a more unhealthy country than that which extends from the Balkan to the borders of the Danube and the Pruth. This difference between the climate of the mountains and that of the plain is the most effectual defence which nature has given to Choumla. In the late war between Russia and Turkey, it was besieged by the troops of the former power from July 20, 1828, until October 25, of the same year, when they retired, after the conquest of Varna, October 11. On the 11th of June, 1829, a decisive victory was gained by the Russians over the Turks, not far from Choumla. The grand vizier commanded the Turks, who are said to have lost 6000 killed, 1500 prisoners, and 60 pieces of cannon, with large quantities of ammunition and baggage. The loss of the Russians amounted only to 1400 killed and 600 wounded.

SHIVE, *n. s.* Belg. *schyve*, of Goth. *skyfa*, to divide. A slice of bread. Obsolete.

SHIVER, *v. a., v. n., & i* Teut. *schauern*, of **SHIV'ERY**, *adj.* [*n. s.* } Goth. *skyfa*, to split or divide. To quake; tremble with some degree of violence: shudder; fall to pieces: break into pieces; shatter: shiv'ery is incoherent; falling easily into fragments or shivers.

The ground with *shivered* arms ur-trown. *Milton*.
Give up Laius to the realms of day,
Whose ghost, yet *shivering* on Cocytus' sand,
Expects its passage to the farther strand. *Pope*.
Prometheus is laid

On icy Caucasus to *shiver*,
While vultures eat his growing liver. *Swift*.
Showers of granados rain, by sudden burst
Displinging murderous bowels, fragments of steel;
A thousand ways at once the *shivered* orbs
Fly diverse, working torment. *Philips*.

SHIVERS, in the sea language, little rollers, or round wheels of pulleys.

SHOA, or **XOA**, a province of Abyssinia, where the royal line of Solomon lived during their expulsion from the throne. See **ETHIOPIA**.

SHOAD, among miners, denotes a train of metalline stones, serving to direct them in the discovery of mines.

SHOAD-STONE, *n. s.* From **SHED**. See below.

Certain tin stones lie on the face of the ground, which they call *shoad*, as shed from the main load, and made somewhat round by the water.

Carew's Survey of Cornwall.

Shoadstone is a small stone, smooth without, of a dark liver colour, and of the same colour within, only with the addition of a faint purple. It is a fragment broke off an iron vein.

Woodward on Fossils.

The loads or veins of metal were by this action of the departing water made easy to be found out by the *shoads*, or trains of metallick fragments borne off from them, and lying in trains from those veins towards the sea, in the same course that water falling thence would take. *Id.*

SHOAD-STONES, a term used by the miners of Cornwall and other parts of England, to express such loose masses of stones as are usually found about the entrances into mines, sometimes running in a straight course from the load or vein of ore to the surface of the earth. These are stones of the common kinds, appearing to have been pieces broken from the strata or larger masses; but they usually contain mundic, or marcasitic matter, and more or less of the orb to be found in the mine. They appear to have been at some time rolled about in water, their corners being broken off, and their surface smoothed and rounded. The antimony mines in Cornwall are always easily discovered by the *shoad-stones*, these usually lying up to the surface or very nearly so; and the matter of the stone being a white spar, or debased crystal, in which the native color of the ore, which is a shining bluish-black, easily discovers itself in streaks and threads. *Shoad-stones* are of so many kinds, and of such various appearances, that it is not easy to describe or know them: but the miners, to whom they are of the greatest use in tracing or searching after new mines, distinguish them from other stones by their weight; for if very ponderous, though they look ever so much like common stones, there is great reason to suspect that they contain some

metal. Another mark of them is their being spongy and porous; this is a sign of especial use in the tin countries; for the tin *shoad-stones* are often so porous and spongy that they resemble large bodies thoroughly calcined. There are many other appearances of tin *shoads*, the very hardest and firmest stones often containing this metal. When the miners, in tracing a *shoad* up hill, meet with such odd stones and earths that they know not well what to make of them, they have recourse to vanning, that is, they calcine and powder the stone, clay, or whatever else is supposed to contain the metal; and then washing it in an instrument prepared for that purpose, and called a vanning shovel, they find the earthy matter washed away, and of the remainder the stony or gravelly matter lies behind, and the metalline matter at the point of the shovel. If the person who performs this operation has any judgment, he not only easily discovers what the metal is that is contained in the *shoad*, but also will make a very probable guess at what quantity the mine is likely to yield of it in proportion to the ore.

SHOAL, *n. s., v. n., & i* Sax. *feole*; Belg. **SHOALY**, *adj.* [*adj.* } Goth. *kule*, full. A crowd; a great multitude; a throng; hence a number of shelving rocks; a sand-bank; shallow sea: as a verb neuter, to crowd; throng; be or grow shallow: the adjective corresponding.

A league is made against such routes and *shoals* of people as have utterly degenerated from nature.

Bacon.

Where there be great *shoals* of people which go on to populate without foreseeing means of sustentation, once in an age they discharge part of their people upon other nations. *Id.*

The wave-sprung entrails, about which faunsens and fish did *shole*. *Chapman.*

The haven's mouth they durst not enter, for the dangerous *shoals*. *Abbot's Description of the World.*

The vices of a prince draw *shoals* of followers, when his virtue leaves him the more eminent, because single. *Decay of Piety.*

What they met

Solid, or slimy, as in raging sea,
Tost up and down, together crowded drove
From each side *shoaling* towards the mouth of hell. *Milton.*

A *shoal* of silver fishes glides
And plays about the barges. *Waller.*

The watchful hero felt the knocks, and found
The tossing vessel sailed on *shoally* ground. *Dryden.*

He heaves them off the *sholes*. *Id.*

The depth of your pond should be six foot; and on the sides some *sholes* for the fish to lay their spawn. *Mortimer.*

God hath the command of famine, whereby he could have carried them off by *shoals*. *Woodward.*

Around the goddess roll
Broad hats, and hoods, and caps, sable *shoal*;
Thick, and more thick, the black blockade extends. *Pope.*

SHOAL, in sea language, is the same as shallow, and is applied to flats in the water. They say it is good shoaling, when a ship sailing towards shore, they find by her founding it grows shallower and shallower by degrees, and not too suddenly; for then the ship goes in safety.

SHOALNESS, a low point on the north-west coast of North America. Captain Cook thus describes the character of the natives :—' While we lay here, twenty-seven men of the country, each in a canoe, came off to the ships, which they approached with great caution, hallooing and opening their arms as they advanced. This, we understand, was to express their pacific intentions. At length some approached near enough to receive a few trifles that were thrown to them. This brought on a traffic between them and our people, who got dresses of skins, bows, arrows, darts, wooden vessels, &c.; our visitors taking in exchange whatever was offered them. They seemed to be the same kind of people that we had lately met with along this coast; wore the same ornaments in their lips and noses, but were far more dirty and not so well clothed. They appeared to be wholly unacquainted with people like us; knew not even the use of tobacco; nor was any foreign article seen in their possession, unless a knife may be considered as such. This indeed was no more than a piece of common iron fitted into a wooden handle. They, however, knew the value and use of this instrument so well that it seemed to be the only article they wished for. Most of them had their hair shaved of cut short off, leaving only a few locks behind, or on one side. As a covering for the head they wore a hood of skins, and a bonnet apparently of wood. One part of their dress was a kind of girdle, very neatly made of skin, with trappings depending from it, and passing between the legs, so as to conceal the adjoining parts. By the use of such a girdle, it should seem that they sometimes go naked, even in this high latitude; for they hardly wear it under their own clothing. The canoes were made of skins, like all the others we had lately seen; except that these were broader, and the hole in which the man sits was wider than in any I had before met with.' Long. 198° 12' E., lat. 60° N.

SHOALS, ISLES OF, or Smith's Islands, seven islands on the coast of New Hampshire, eleven miles south-east of Portsmouth. Long. 70° 33' W., lat. 42° 59' N. Staten Island, on which is the town of Gosport, belongs to New Hampshire; the rest to Maine. They are inhabited by about 100 fishermen.

SHOAL-WATER BAY, a bay on the east coast of New Holland, visited by captain Flinders in 1802, who says that it offers no advantages to ships which may not be had on any other part of the coast, except that the tides rise higher, and that in the winter season fish are more plentiful. Long. of Aken's Island, situated at its entrance, 150° 15' E., lat. 22° 21' 35" S.

SHOAL-WATER BAY, a bay on the west coast of North America. Long. 124° 10' W., lat. 46° 50' N.

SHOCK, *n. s., v. a., & v. n.* Saxon *ƿcæoc*; Fr. *choc*; Belg. *schocken*. Conflict; mutual impression of violence; concussion; offence; a pile of corn thrown together; a rough dog; as a verb active, to shake by violence; offend; disgust; as a verb neuter, to meet with violence; be offensive; pile corn in sheaves.

In a full age, like as a *shock* of corn cometh in his season.

Joh.

Corn tithed, Sir parson, together to get,
And cause it on *shocks* to be by and by set. *Tusser*
Reap well, scatter not, gather clean that is shorr,
Bind fast, *shock* apace, have an eye to thy corn. *Id.*
Thou, full of days, like weighty *shocks* of corn
In season reaped, shall to thy grave be borne.

Sandys.

These her princes are come home again :
Come the three corners of the world in arms,
And we will *shock* them. *Shakspeare. King John.*
Thro' the *shock*
Of fighting elements, on all sides round
Environed, wins his way. *Milton.*

It is inconceivable how any such man, that hath stood the *shock* of an eternal duration without corruption or alteration, should after be corrupted or altered.

Judge Hale.

Supposing verses are never so beautiful, yet, ' they contain any thing that *shocks* religion or good manners, they are—

Versus inopes rerum, nugæque canoræ. *Dryden.*

Those that run away are in more danger than the others that stand the *shock*.

L'Estrange.

I would fain know why a *shock* and a bound are not distinct species.

Locke.

Such is the haughty man; his tow'ring soul,
'Midst all the *shocks* and injuries of fortune,
Rises superior, and looks down on Caesar.

Addison.

The French humour, in regard of the liberties they take in female conversations, is very *shocking* to the Italians, who are naturally jealous.

Id. Remarks on Italy

These strong unshaken mounds resist the *shocks*
Of tides and seas tempestuous, while the rocks,
That secret in a long-continued vein
Pass through the earth, the pond'rous pile sustain.

Blackmore.

Those who in reading Homer are *shocked* that 'tis always a lion, may as well be angry that 'tis always a man.

Pope.

And now with shouts the *shocking* armies clos'd :
To lances lances, shields to shields oppos'd ;
Communal death the fate of war confounds,
Each adverse battle gored with equal wounds.

Pope.

Behind the master walks, builds up the *shock* ;
Feels his heart heave with joy.

Thomson.

The mighty force
Of Edward twice o'erturned their desp'rate king :
Twice he arose, and joined the horrid *shock*.

Philips.

Fewer *shocks* a statesman gives his friend. *Young.*
Julian, who loved each sober mind to *shock*,
Who laugh'd at God, and offered to a cock. *Harte.*

SHOE, *n. s. & v. a.*, [Plural shoes, anciently *shoon*, *pret.* and *pass. part.* *shod*.] Sax. *ƿreo*, *ƿreo*; Belgic *schoe*; Goth. *sko*. The cover of the foot, of horses as well as men; to fit with a shoe or shoes; cover at the bottom: a shoe-boy is the boy who cleans and has the care of shoes: shoeing-horn, a horn used to put on shoes: hence a low *tool* of any kind: the other compounds are plain.

Strong axletree'd cart that is clouted and *shod*.

Tusser.

Your hose should be ungartered, your shoe untied, and every thing about you demonstrating a careless desolation.

Shakspeare.

Spare none but such as go in clouted *shoon*,
For they are thrifty honest men. *Id. Henry VI.*
The smith's note for *shoeing* and ploughing irons.

Shakespeare.

The wheel composed of cricket's bones,
And daintily made for the nonce,
For fear of rattling on the stones,
With thistle down they *shod* it. *Drayton.*

Madam, I do, as is my duty,
Honour the shadow of your *shoetye*. *Hudibras.*

I was in pain, pulled off my *shoe*, and some ease
that gave me. *Temple.*

This hollow cylinder is fitted with a sucker, upon
which is nailed a good thick piece of tanned *shoe-*
leather. *Boyle.*

Unknown, and like esteemed, and the dull swain
Treads on it daily with his clouted *shoon*,
And yet more medicinal than that moly
That *Hermes* once to wise *Ulysses* gave;
He called it *hamony*. *Milton.*

I have been an arrant *shoeing-horn* for above these
twenty years. I served my mistress in that capacity
above five of the number before she was *shod*.
Though she had many who made their applications
to her, I always thought myself the best *shoe* in her
shop. *Spectator.*

If I employ a *shoeboy*, is it in view to his advan-
tage, or my own convenience? *Swift.*

Tell your master that the horses want *shoeing*.
Id.

A cobbler or *shoemaker* may find some little fault
with the latchet of a *shoe* that an *Apelles* had
painted, when the whole figure is such as none but
an *Apelles* could paint. *Watts.*

SHOES, among the Jews, were made of leather,
linen, rush, or wood; those of soldiers were
sometimes of brass or iron. They were tied with
thongs which passed under the soles of the feet.
To put off their shoes was an act of veneration;
it was also a sign of mourning and humiliation:
to bear one's shoes, or to untie the latchets of
them, was considered as the meanest service.
Among the Greeks shoes of various kinds were
used. Sandals were worn by women of distinction.
The Lacædæmonians wore red shoes. The
Grecian shoes generally reached to the middle of
the leg. The Romans used two kinds of shoes;
the calceus, which covered the whole foot some-
what like our shoes, and was tied above with lat-
chets or strings; and the solea or slipper, which
covered only the sole of the foot, and was fas-
tened with leathern thongs. The calceus was
always worn along with the toga when a person
went abroad; slippers were put on during a
journey and at feasts, but it was reckoned effemi-
nate to appear in public with them. Black shoes
were worn by the citizens of ordinary rank, and
white ones by the women. Red shoes were
sometimes worn by the ladies, and purple ones
by the coxcombs of the other sex. Red shoes
were put on by the chief magistrates of Rome on
days of ceremony and triumphs. The shoes of
senators, patricians, and their children, had a
crescent upon them, which served for a buckle;
these were called *calcei lunati*. Slaves wore no
shoes: hence they were called *cretati*, from their
dusty feet. Phocion also and Cato *Uticensis*
went without shoes. The toes of the Roman
shoes were turned up in the point; hence they
were called *calcei rostrati*, *repandi*, &c. In the
ninth and tenth centuries the greatest princes
of Europe wore wooden shoes, or the upper part

of leather and the sole of wood. In the reign
of William Rufus, a great beau, Robert, sur-
named the horned, used shoes with long sharp
points, stuffed with tow, and twisted like a ram's
horn. It is said the clergy, being highly offended,
declaimed against the long-pointed shoes with
great vehemence. The points, however, con-
tinued to increase, till in the reign of Ricnard II.
they were of so enormous a length that they were
tied to the knees with chains sometimes of gold,
sometimes of silver. The upper parts of these
shoes in Chaucer's time were cut in imitation
of a church window. The long pointed shoes
were called crackowes, and continued in fashion
for three centuries in spite of the bulls of popes,
the decrees of councils, and the declamations of
the clergy. At length the parliament of England
interposed by an act, A. D. 1463, prohibiting the
use of shoes or boots with pikes exceeding two
inches in length, and prohibiting all shoemakers
from making shoes or boots with longer pikes
under severe penalties. But even this was not
sufficient: it was necessary to denounce the
dreadful sentence of excommunication against
all who wore shoes or boots with points longer
than two inches. The present fashion of shoes
was introduced in 1633; the buckle was not
used till 1670. In Norway they use shoes of a
particular construction, consisting of two pieces,
and without heels; in which the upper leather
fits close to the foot, the sole being joined to it
by many plaits or folds. The shoes or slippers
of the Japanese, as we are informed by professor
Thunberg, are made of rice straw woven, but
sometimes, for people of distinction, of fine slips
of ratan. The shoe consists of a sole without
upper leather or hind piece; forwards it is
crossed by a strap of the thickness of one's
finger, which is lined with linen; from the tip of
the shoe to the strap a cylindrical string is
carried, which passes between the great and
second toe, and keeps the shoe fast on the foot.
As these shoes have no hind piece, they make a
noise when people walk in them, like slippers.
When the Japanese travel, their shoes are fur-
nished with three strings made of twisted straw,
with which they are tied to the legs and feet, to
prevent them from falling off. Some people
carry one or more pairs of shoes with them on
their journeys, in order to put on new, when the
old ones are worn out. When it rains, or the
roads are very dirty, these shoes are soon wetted
through, and one continually sees a great num-
ber of worn out shoes lying on the roads, espe-
cially near the brooks, where travellers have
changed their shoes after washing their feet. In-
stead of these, in rainy or dirty weather, they
wear high wooden clogs, which underneath are
hollowed out in the middle, and at top have a band
across like a stirrup, and a string for the great
toe; so that they can walk without soiling their
feet. Some of them have their straw shoes fas-
tened to these wooden clogs. The Japanese
never enter their houses with their shoes on;
but leave them in the entry, or place them on the
bench near the door, and thus are always bare-
footed in their houses, so as not to dirty their
neat mats. During the time that the Dutch live
at Japan, when they are sometimes under an
obligation of paying visits at the houses of the

Japanese, their own rooms at the factory being likewise covered with mats of this kind, they wear, instead of the usual shoes, red, green, or black slippers, which on entering the house they pull off: however, they have stockings on, and shoes made of cotton stuff with buckles in them, which shoes are made at Japan, and can be washed when dirty. Some have them of black satin, to avoid washing them.

SHOES. For a method of making shoes by rivetting, instead of sewing, a patent was taken out in 1809 by Mr. David Mead Randolph, an American. In his specification, he describes that the rivetting, which he proposes to substitute for sewing, is only applicable to the soles and heels of boots or shoes, all the other parts being made in the usual manner. The last which is used for this method is the only implement which demands a particular description. It is first made in wood, of the same figure as the common last, and adjusted in the usual manner to the size and shape of the shoe which is intended to be made or put together upon it. The lower part or sole of the last is then covered with a plate of iron or steel, about the same thickness as a stout sole leather: this plate, being formed to the exact shape which is desired, is fastened down upon the wood by screws or rivets. The iron plate has three circular holes made through it, one at the toe, another about half way between the toe and the heel, and a third at the heel: the holes are about an inch in diameter, and being filled up with wooden plugs, and cut down even with the surface of the iron, they will admit the points of temporary nails to be driven through the leather sole to penetrate into the wood, and fix the sole upon the last whilst the work goes on. The making of the shoe is conducted in the usual manner, until it is ready for putting on the last. To do this, the inner sole is put upon the iron sole of the last; then the upper-leathers are put upon the opposite part, and the edges of the leather are turned down over the edges of the inner sole: the outer sole is then applied over the turning-down, and fastened in a temporary manner upon the last, by driving one or two nails, through both soles, into the wooden plugs before mentioned, which fill up the holes in the iron face of the last. Now, to unite the two soles to the upper-leathers, holes are pierced all round the edges of the sole, and small nails are driven in, which are of sufficient length to penetrate through the sole and the turning-in of the upper-leathers, and also through the inner sole, so as to reach the metal face of the last, and, being forcibly driven, their points will be turned by the iron, so as to clench withinside, or rivet through the leather, and serve instead of the sewing or stitching commonly employed to unite the sole to the upper-leathers.

Mr. Brunel's machines for making shoes are an improvement of the above plan. He established, not long since, at Battersea an extensive manufactory, chiefly intended to supply the army with this article, where all the operations were performed by the aid of machines, which act with such facility that they can be managed by the invalid soldiers of Chelsea Hospital, the only workmen employed, and most of them disabled by wounds, or the loss of their legs, from any

other employment. Of the shoes made by these machines, the upper-leathers are the same as those of any other shoes, and consist of three pieces; viz. the vamp, or part which covers the upper part of the foot, and the two quarters which surround the heel, and are sewed together behind it; they are also sewed to the vamp at about the middle of the length of the shoe. The sole part of the shoe is composed of the real or lower sole, with its welt, the heel, and the inner or upper sole. The lower sole has an additional border, which is called the runner, or welt, fixed upon its upper side, all round the edge, by a row of rivets, so that it makes a double thickness to the sole towards the edge; but this additional piece is only of small width from the outside of the sole inwards, and gradually diminishes away in thickness to nothing, as it recedes from the edge of the sole, so that the middle part of the sole is only of the same thickness as the single leather. The upper-leathers are made sufficiently large to turn in, all round, beneath the foot, under the edge of the inner sole, for about three-quarters of an inch wide, and the outer sole, reinforced by the welt, is applied beneath, so that the turning-in is included between the two soles; that is, it is included between the edge of the inner sole and the welt, or extra thickness which surrounds the lower sole. To hold the shoe together, a row of rivets is put through the sole, all round the edge, and they are of sufficient length to pass through all the four thicknesses; viz. the lower sole, the welt, the upper-leathers (where they are turned in), and also through the inner sole; and these rivets, being made fast, unite the parts of the shoe together in a much firmer manner than sewing. The rivets have no heads, but are made tapering, and the largest ends are on the outside of the sole, which prevents them from drawing through; and at the same time the strength of the rivetting will not be materially impaired by the gradual wearing away of the sole leather.

These rivets prevent the wear in a very great degree, and for this reason there is a greater number of rivets put into the sole than merely those which hold the shoe together. The different nails are, first, the short nails, or rivets, which only penetrate through the single thickness of the lower sole; these are arranged in parallel rows across the tread of the foot, that is, about two-thirds of the length from the heel; there is likewise a double row of short nails, which is carried round parallel to the outline of the toe, at about three-quarters of an inch from the edge, and extends as far as the middle of the foot. Next the tacking nails, which are of a sufficient length to reach through both the sole and the welt, and thus fix the two together: of these, there is a row all round the edge of the foot, nearer to the edge than the row of short nails before mentioned. Lastly, the long nails, which, as before described, fasten the shoe together: these form also a complete row round the edge of the whole shoe, and nearer to the edge than any of the preceding rows. The heel is also fastened on by a row of long nails round its circumference. The heads or thick ends of all these nails appear on the lower surface of the sole, and all contribute to preserve the leather

from wearing. We must confine ourselves to a description of that part of the machinery which strictly performs shoe-making.

The leather is *hardened* by passing it between rollers, to produce the same effect as hammering does in the ordinary method of shoe-making. The rollers used for this purpose are made of brass, about five inches diameter, and as much in length; they are mounted in the usual kind of frame, except that instead of screws to hold down the upper roller, and regulate its distance from the lower one, two plain cylindric pins are inserted into the holes which usually receive the screws, and these pins have a strong lever bearing upon their upper ends, to press the upper roller down upon the lower, by the action of a weight at the extremity of the lever. These pins are only about four inches distant from the centre or fulcrum of the lever, and the weight (of about 100 lbs.) is at a distance of four feet from the centre, it therefore presses down the upper roller upon the lower with a force of nearly 1200 lbs. The lower roller has a cog-wheel upon the extremity of its spindle, which is moved by a pinion upon the end of an axis turned by a winch; one man turns this winch, and another puts the soles between the rollers. Two soles are presented together, being laid one upon the other, with the flesh sides of the leather towards each other, and an iron plate is placed between them, which is made thick in the middle, and diminishes every way to the edges, where it is thin. The grain or hair side of the leather of the two soles is outside, so as to be in contact with the rollers when the soles are presented to the machine which draws them in; and, when they have nearly passed through, the man who turns the winch reverses the motion, and rolls them back again, then forwards, and so on for four or five times, in the same manner as the motion for mangling linen. After this operation the leather becomes hard and solid, and much reduced in thickness, particularly at the middle part. The heels being so small cannot conveniently be rolled; but to produce the same effect they are stamped in a fly-press: for this purpose, a heel-piece is put into a small box or cell of cast-iron, of a proper shape to receive it, and a thick plate, which is fitted to the box, being laid upon it, the whole is put beneath the screw of the press, one blow of which is sufficient to press the iron plate upon the leather with a force which will render it hard and solid.

The sole is made complete by joining to it the small semicircular piece at the heel; for this purpose, the parts which are to be joined together are cut bevelled, so that they will overlap without increasing the thickness, and then three or four nails are driven through the bevelled parts to hold them together. To cut the joints bevelled, a simple press is used; the sole is laid flat upon the edge of the bench, and a piece of iron is pressed down upon it by a lever, upon which the workman leans his elbow. The edge of the bench is bevelled and faced with iron, and this, together with the upper piece of iron, guides the knife, so that it will cut the joint bevelled: the heel-piece is then cut in the same manner, but reversed.

The leather for the sole is next inlaid with *short copper* or *iron nails*, which are put through holes in the leather, in the broad part of the foot, where the greatest wear will take place; and there is also a double row of similar rivets, inlaid round the toe part, at about three-quarters of an inch within the edge of the sole. The holes for these nails are first punched in the leather of the sole by a punching machine, and then a second machine cuts the nails, and inserts them into the holes.

The *punching machine* is moved by the foot of the workman, who is seated before a small semicircular table of cast iron, on which he places the leather. This table is supported by a strong column, rising from the floor to a height of about two feet above the table, which is joined to the column by a projecting bracket, so that the column is on the opposite side to that where the workman is seated. The upper part of the column has two arms, projecting forwards from it towards the workman, and extending over the table; at their extremities they are formed into sockets, to sustain a square iron rod or perpendicular slider, which at the lower end has the piercer or awl screwed into it: one of the sockets guides the upper part of the slider, and the other the lower part, so that it has a freedom of motion in a perpendicular direction, but no other. The slider is caused to descend by means of a treadle moving on a centre pin, attached to the foot of the iron column, beneath the bench; from this treadle an iron rod ascends through a hole in the bench (and also through holes in the arms, which project from the column to sustain the slider), and at the upper end this rod is connected with a lever, which moves on a joint at the upper end of the iron column, whilst the extreme end of the lever is connected with the top of the perpendicular slider. By this arrangement it is clear that the foot, being pressed upon the treadle, will communicate motion by the iron rod and upper lever to the slider and piercer, and force its point through the leather, which is placed upon the small iron table. A short lever and counterpoise are provided to raise up the slider again the instant the pressure is removed. To prevent the piercer striking upon the iron of the table, and breaking the point, a screw is inserted in a piece projecting from the slider, and its point in descending comes to rest upon the upper of the two arms which sustain the slider, and thus stops the descent of the slider at the proper place. The piece of leather for the sole is fixed upon a pattern made of iron plate, cut to the same size and shape as the sole, which is united to it by two sharp gauge pins, which are fixed in the pattern, one at the middle of the tread, and the other in the centre of the heel; and these pins project so far that they will just penetrate through the leather, to hold it fast against the pattern, which is perforated with all the holes which are intended to be pierced in the sole. The leather is applied upon the pattern, and struck with a mallet, so as to force the gauge pins into the leather, and unite the sole and the pattern together; the pattern is then laid flat upon the table of the machine, with the leather uppermost, and is brought beneath the point

of the piercer, so that it will penetrate in the desired place. To ascertain this place, a small stud or pin is inserted into a hole in the table, in the exact spot where the point of the piercer descends; the stud projects a little above the surface of the table, but is only held up by a spring, so that it can easily be pressed down. The pattern being placed so that any of the holes therein receive the point of the stud, it is evident that, when the pressure of the foot makes the piercer descend, its point will make a puncture in the leather which is fastened upon the pattern, which puncture will be opposite to the hole in the pattern; and, though it perforates the leather quite through the thickness, the point of the piercer cannot be blunted against the iron, because it is received in the hole in the pattern, and the stud descends by the pressure, so that the pattern will lie quite flat upon the surface of the table. In this manner the workman pierces any number of holes in the leather, placing it beneath the point of the piercer by the aid of the pattern, and then pressing the foot to bring the point down and pierce the hole. As soon as the piercer rises he removes the pattern to another hole, and so on. A small piece of iron is fixed just above the leather which prevents its being lifted up and following the piercer when it rises. The piercer passes through a hole in this piece.

The sole being thus pierced with holes is prepared for *nailing*, and the short nails are put into it by a very curious machine, which at the same time forms the nails, by cutting them off from the end of a strip of iron or copper, of the same breadth as the length of the intended nails.

The sole is presented to this machine by laying it upon a small table similar to the last machine, and is directed by means of the same pattern; so that each of the holes in the leather will be successively brought beneath the point of a blunt piercer, which descends by the action of a treadle. In the upper part of the machine is a pair of shears to cut the nails: they consist of a lever, loaded at the extremity with a weight, and connected with the treadle, so that the end of the lever is lifted up when the treadle is depressed by the foot. Near the centre of this lever is a cutter, which is fixed to it and moves with it. Another cutter is supported by the frame, so as to be stationary, and in the proper situation to come in contact with the edge of the moving cutter when the end of the lever is lifted up. The cutters act in a manner similar to a pair of shears, to cut off a small piece from across the end of a slip of iron, which is introduced between the cutters. This piece forms the nail or rivet which is to be put into the hole in the leather; and immediately after it is cut it falls into a tube, by which it is conducted down to a small cell or tube, situated immediately over the leather. In this the nail stands perpendicular, and ready, when the piercer descends, to be forced down into the hole in the leather; because the cell which receives the nail is exactly beneath the point of the piercer, so as to hold it perpendicularly in the proper situation. The workman is seated before the machine, and with his right hand directs the sole, with its pattern beneath

the piercer, in the same manner as before described. In his left hand he holds the strip of iron or copper which is to make the nails; and he introduces the end of it through a small hole which conducts to the cutters, pushing it forward with a gentle force: this causes the end of the strip to enter between the cutters when the shears are open. Then adjusting the sole by the pattern, so that one of the holes in the leather will be beneath the nail contained in the cell, he presses down the treadle: this forces the nail down from the cell into the leather, by the descent of the piercer, and at the same time closes the shears, and cuts off a nail across the end of the strip. The nail immediately descends by the tube into the cell, where it places itself perpendicularly, and ready to be put in its place in its turn. Thus the machine, at every stroke, cuts a fresh nail to supply the place of that which it puts in the leather by the same stroke. The strip of copper is turned over every time to form the nails alternately head and point. When all the nails are put in they are battered down with a hammer; and, as they are but very little longer than the thickness of the sole, this reduces them to an even surface.

The *welt*, or runner, is a narrow slip of leather applied upon the sole, round its edge, to make the sole of a double thickness round the edge, where the upper leather joins to the sole, although the sole is only single within. The welt is made from the feather-edged slips which we have before mentioned, and is fastened to the sole by tacking nails of sufficient length to pass through both the sole and the welt. These nails are arranged all round the circumference of the sole, and the holes are first pierced through the sole by the punching machine, which we have before described, but by a different pattern of iron, which is attached to the sole by its two gauge pins entering the same holes which were made through the leather in the first operation. This pattern is pierced with a row of holes all round the circumference, which are arranged within the former row of rivets, or farther from the edge of the sole; but around the toe and tread of the foot, for half its length, the holes are in double number, or at half the distance that they are in the heel part. This pattern being used in the same manner as before described, the punching machine pierces the sole with holes, exactly corresponding to it; which holes are filled with tacking nails in a separate machine, something similar to the nailing machine before described. But, as the nails are longer, it would be too laborious to cut them by the same motion; the nails are, therefore, cut by a machine made on purpose, and applied to the leather by the nailing machine for long nails. This is made exactly the same as the punching machine before described, but with additional apparatus to supply the nails and put them into the holes. The additional parts are as follow:—A circular plate, or wheel of brass, about nine inches diameter, and of a thickness nearly equal to the length of the nails; it is perforated with a great number of holes, to contain the same number of nails; the holes being made round its circumference, as close together as convenient, and arranged in

four circles, one within the other. The interior space within the circles is formed with six arms like a wheel; and in the centre is a hole, which fits loosely upon an upright centre pin, standing in the centre of a small circular table, which is fixed sideways to the upper of the two arms, which, as before mentioned, project from the vertical column of the machine, and sustain the upper end of the perpendicular slider. Upon this circular table the wheel is supported in a horizontal position, at the height of eighteen or twenty inches above the table on which the leather is placed, and with liberty to turn upon its centre pin. The wheel is filled with nails when it is used, one being put into every hole of its circumference, with the points downwards; and the holes are sufficiently large to let the nails drop through the wheel, except when their points rest upon the circular table which supports the wheel. At one part of the circumference of this table an opening is cut through it, and a small tube descends from it, to conduct a nail down to the point of the piercer. The motion of the wheel upon its centre brings the nails successively over the opening or mouth of the tube; and therefore each nail in its turn drops by its weight through the hole in the wheel into the tube, which is made so small that the nail must descend with its point downwards, and fall into a small cell, so situated that the nail will stand exactly beneath the point of the piercer when the same is at its highest position. But, when the piercer is depressed by the action of the treadle, its point will act upon the head of the nail, and force it down through the cell into the leather placed upon the table of the machine; the hole in the leather having been previously pierced by the punching machine. The cell which receives the nail is very ingeniously contrived to hold it in a perpendicular direction beneath the end of the piercer. It is situated immediately above the leather, and is conical within, so that the nail drops down into it until it becomes fixed fast; but when the nail is to be forced down by the piercer, the cell opens in two halves, being formed by notches in two pieces of steel, which are only held together by being screwed together at one end, and are made so thin as to spring together, and form a cell for the reception of the nail, although they will readily separate when the piercer forces down the nail. It is during the ascent of the piercer that another nail is dropped down from the wheel through the tube, and received into the cell, whilst its two halves are still kept open by the piercer; or rather, as the piercer at this moment occupies the interior of the cell, the nail is received in the space or open joint at which the two halves of the cell separate, so that the nail lies close by the side of the piercer. But, when the piercer has risen up completely out of the cell, its two halves spring together, and the joint in which the nail is placed being formed with faces inclining inwards, they throw the nail into the cell itself, in which it drops down till it sticks fast; because, as before stated, the cell is smaller at the bottom; and in this situation the nail is certain to be held perpendicular, with its head under the point of the piercer. To turn the

wheel round, so as to supply a fresh nail every time that one has been put into the leather, the edge of the wheel is cut into serrated or sloping teeth; the number of teeth being equal to the number of holes made in each of the four circles to contain the nails. A small detent or click takes into these teeth by a hook, so that it will turn the wheel when moved in one direction, but slide over the teeth when moved in the other direction. The click is jointed to a short lever, fixed upon the upper end of an upright axis, which passes down through the two projecting arms of the main column, so as to be very near the perpendicular slider; and a short lever, fixed to this axis, bears, by the action of a spring, against a wedge fixed to the slider. The action of this mechanism is to turn the wheel round one tooth at a time; thus, when the slider descends, its wedge forces the end of the short lever farther away from it; this movement is communicated by the upright axis and upper lever to the click, which slides over the sloping sides of the teeth of the wheel; but, on the re-ascent of the slider, the wedge allows the lever and click to return by the action of a spring, and the hook of the click, having caught a tooth of the wheel, will turn the wheel round the space of one tooth. In this manner, at every descent of the slider, the click engages a fresh tooth of the wheel; and at every ascent the wheel is turned round upon its centre pin; the weight of the wheel, resting upon the flat circular table, being sufficient to retain it as it is placed.

The nailing machine acts with the same rapidity as the other machines, to put a nail into every one of the holes previously made; and for this purpose the leather is kept upon the same pattern by which those holes were pierced, not only for the purpose of placing the leather so that the nails shall be inserted into those holes, but that the thickness of the pattern may allow the nails to penetrate and project through the leather on the under side. When the nails are all put in, they are beat down with a hammer to drive all the heads to a level with the surface. The leather is then separated from the pattern and put into a frame called the *welting stand*.

A small square table of cast-iron, fixed on the top of a pedestal, in which it is capable of turning round, forms the *welting stand*. For the convenience of the workman, and to enable him to work at the different sides, he remains seated before the table. An iron frame is connected with the table by hinges at one side, so that it can be lifted up or turned down, to lie flat upon the surface of the table; and in this situation it can be fastened down by means of a simple clamp. This frame is intended to hold fast the leather which is placed beneath the frame; the interior opening of the iron frame is nearly of the same size and shape as the sole of the shoe. The sole is placed flat upon the table, in the proper position, which is determined by two gauge pins fixed into the table, and entering the holes made in the sole; then the iron frame, being turned down upon the leather, will enclose the sole as it were with an iron hoop, or raised border all round the edge; and, the frame being

clamped fast down, the sole is confined, as if lying in the bottom of a cell of iron, of the same figure as itself, and with the nail points projecting upwards from the sole. In this frame the welt is applied by laying the strip of leather upon the edge of the sole in contact with the inside of the iron frame, and bending it to follow the curves of the outline of the sole. As fast as any part of the length of the strip is settled to its position, it is attached to the sole by striking it down with a mallet upon the points of the nails. The thin or feathered edge of the strip of leather is put inside, so that the edge of the sole, for about the breadth of half an inch, is of

double thickness; but, within this, the extra thickness diminishes away to nothing, leaving only the thickness of the sole. The ends of the strip of leather which compose the welt, where they join and complete the circuit of the sole, are cut sloping so as to lap over each other, and make a joint, without any increase of thickness or apparent division. When the sole is taken out of this frame, the welt and sole are beat well down together to make a good joint; it is then carried to the cutting-press, in which the edge or outline of the sole and welt are cut smooth, and to the same size; because, as the frame of the welting machine must be rather less than the sole, in order that the frame may bear upon the edges of the sole all round, and thus hold it fast, the welt, which is moulded or bent round within the frame, will be a small quantity less all round than the sole. To guide the knife in cutting round the edge of the sole, it is confined between two iron patterns, which are made exactly to the size to which the edge is to be pared. They are attached to the sole by two gauge pins fixed into one of the plates, and, passing through the holes in the sole, project far enough on the opposite side for the other plate to be fastened on in its required position, by two holes which receive the ends of the pins.

The *cutting-press* resembles a common lathe. A horizontal spindle is supported in a frame consisting of two standards, erected from a horizontal plate, to sustain the spindle, which passes through a collar in one of these standards, and projects some inches beyond it, having at the extremity a piece of wood flat on the surface, and of the same shape as the sole. Against this flat surface the two iron plates with the sole between are placed, and they are forcibly pressed together by the action of a screw, fitted into a third iron standard, erected from the same horizontal plate, and pressing by means of a lever upon the iron plates exactly opposite the end of the spindle. This pressure causes the spindle to retreat a small quantity in the direction of its length, and then a flat circular plate fixed upon the spindle (in the same situation as the pulley of a common lathe), is made to press against a similar flat plate, which is fastened to the frame, and therefore cannot turn round. By the friction between these two surfaces, the spindle becomes immovable, and the press holds the sole firm, whilst the workman, who is seated before the machine, cuts all round the edge with a drawing-knife, which is made sharp in the middle, and is worked with both hands by having a

handle at each end. When he has with this tool pared down that part of the edge which is uppermost, he releases the screw of the press, and a spring then causes the spindle to advance so far as to relieve the flat circular plate, which is fixed upon the spindle, from its contact with the fixed plate. This leaves the spindle at liberty to be turned round, and the sole turns with it, so as to bring up a new part of the edge of the leather to a convenient situation to be pared or cut; and the screw is then turned to fasten the spindle as before described, and at the same time to press the sole between the two patterns. When the edge of the sole is thus cut, it is carried to a grindstone, and ground smooth; the stone is turned with a quick motion, by means of a band and large wheel; the leather is afterwards polished by applying it to the edge of a wooden wheel, on which a little bees'-wax is spread.

The sole, thus re-inforced by the welt, is returned to the punching machine, and, being attached to another pattern, a range of holes is pierced all round the outer edge, through both, just within the former row of tacking nails; after which, by the nailing machine, these holes are filled with nails which project through the upper side of the welt, being longer than any of the former, and being also intended to penetrate through the upper-leather and inner soles, and thus fasten the shoe together. In this state the sole is ready to be put to the upper-leathers.

The *upper-leathers* are prepared for applying to the sole in the same manner as the ordinary shoe, viz. by sewing the vamp, or piece which covers the upper part of the foot, to the two quarters which go round the heel, and also sewing these two quarters together behind the heel. The workmen do not hold the work upon their knees to sew it, but four men work at a square table, the corners of which are cut off, and a small piece of wood projects from each angle; the two pieces of leather which are to be sewed together are laid upon one of these pieces of wood in the proper position to be sewed, and are held fast by an endless strap, which is laid over them, and the workman binds it fast down, by pressing his foot in the strap, like a stirrup. This method of sewing, which is far superior to the common mode, might, from its simplicity, be used by all shoe-makers, and would render their business less unhealthy.

The upper-leathers are put upon a last, and held tight thereupon whilst the sole is applied. This is done by the *clamping machine*, which is a small oval table, supported on a column, but capable of turning round upon the column, to enable the workman to work at any side. In the centre of the table a last is fixed with the sole upwards; it is supported at a height of about six inches from the table. The sole is made of cast-iron in a solid piece with the stem or part by which the last is supported; but the under part, upon which the upper-leathers are to be moulded, is made of wood, for the convenience of altering the figure when necessary. The last is fixed upon the table by means of two steady pins; and a strong pin, which projects from the lower part of the last, and passes

through the table, is round fast by a wedge, which confines the last firmly upon the table in the same manner as if it was made in a piece therewith. The table has a number of pieces of brass attached to it by hinges, and arranged all round the last in such a manner that they can be turned up against the lower part of the last, and then form clamps, which are exactly adapted to the figure of the lower part of the last, and will therefore clamp or bind the leather firm upon the last at the toe, heel, and every part thereof, except at the flat part of the sole. The brass clamps are of such dimensions that they will touch each other when turned up, and thus form a complete cell or box, in which the lower part of the last will be contained, and the leather confined upon it; but, the cell being made in several pieces or clamps, they can be removed one by one, as found necessary. The clamps are forced up to their situation by means of an independent screw for each, which is tapped in an oblique direction through the edge of the table, and the point forces up the end of a small rod, which is jointed to the clamp near the part where it acts upon the leather; by this means the force of the screw acts to turn the clamp up upon its hinge, and at the same time press it against the leather. When the pressure is released by displacing the end of the small rod from the point of the screw, the clamp will be suffered to fall back upon the table: and, this being done to all the clamps, the last stands insulated in the middle of the table, from which it can be detached by withdrawing the wedge which confines it. The inner sole of the shoe is first put upon the sole of the last, being slightly fastened thereto by two short pins, one of which is driven through the gauge hole in the toe of the sole, and enters a hole made in the last; and the other pin is fixed in the heel part of the last, and enters the hole in the sole. The upper-leathers are now put upon the last in the true position. In this state the last is taken to the clamping machine, and fastened into its place in the centre of the table; the clamps are then turned up one by one, beginning at the heel, and the upper-leathers being pulled up all round by a pair of pincers, so as to make them fit tight upon the last, the clamps are screwed tight. In this state the upper-leathers are made to take the form of the last, being firmly attached thereto, except at the sole part; at this part the leather stands up all round about three-quarters of an inch, which quantity is turned down flat upon the edge of the inner sole (previously fastened upon the sole of the last), and a small quantity of paste is put in to make it stick fast; four or five notches are cut out in the leather at the toe and at the heel, to make the part which is turned down lie flat upon the sole, without folds or overlapping, and then, to make a close contact, the leather is beaten down. Parings of leather are likewise pasted, and stuck flat upon the inner sole for levelling, to make up the sole to the same thickness in the centre as it acquires towards the edges all round by the turning-in of the upper-leathers. In this state the nail which fastened the inner sole to the last is withdrawn, being now unnecessary, and the real sole is applied,

an iron frame or saddle being employed to determine its proper position upon the last. This frame is made of thin iron, and its figure within is similar, and of the same size as the row of nails which project through the sole, and by which the sole is to be rivetted into its place; it is made in two halves, which are united by a joint or hinge at the heel part; and at the toe part are two holes, through which a pin can be put to hold the frame together. This pin, as well as the joint pin of the hinge at the heel, projects downwards sufficiently to enter into a hole made in each of the two clamps at the toe and heel, in such a position as to guide the frame, so that it will apply the sole exactly in the proper position.

The sole, when prepared, by inserting all the long nails in the holes, so that their points project through the leather, is put into an iron box or mould, and, a plate being laid upon it, is put into the fly-press, and by a single blow the sole is rendered concave withinside, so as to adapt itself to the last. When it is taken out of the mould, the iron frame before mentioned is put together round the row of nails, the size of the inside of the frame being made exactly of the proper size to receive the projecting points of the nails, and retain them perpendicular to the leather, and prevent them from spreading out. The sole is then applied in its place by the two guide pins of the frame, and by striking upon the heads of the nails, their points penetrate through the turning-in of the upper leather, and also through the inner sole. When they are well entered the iron frame is taken away, by withdrawing its pins, and opening its two halves on their joint, and the nails are driven down into their places. This causes them to project through the inner sole into the shoe, and the points meeting the iron last are turned back, and thus clenched into their places. To render this more certain, the sole of the last is made with a slight groove all round, where the points of the nails will fall, and, the groove being of a semicircular figure, the points are more readily turned thereby; and are all turned the same way, so that they will not interfere.

The shoe is now put together, and, the clamps being relieved and turned down, the shoe is taken off the last; for which purpose the heel of the last is made in a separate piece, and jointed to the other by inclined fittings, and with a tongue or rebate, so that it can be held fast in its place by a single hook or spring catch; but, this being relieved, the shoe draws off the last with the greatest ease, the heel part remaining within the shoe, and is taken out afterwards. The shoe is now carried to the *rivetting last*, where it is put upon a last exactly similar to that of the clamping machine, but fastened down upon a bench, and the sole is smooth without the groove which caused the points of the nails to turn up. Upon this last the nails are beaten down, to rivet all fast, and make the sole smooth withinside; the heel is then put on by laying it in its place, and driving down the long nails which have been put through it by the nailing machine, in the same manner as for the sole. The sole of the shoe is now rasped with a coarse file, to level all the nail-heals, and render the

S H O E I N G.

leather smooth; the shoes are then carried to the grindstone, by which they are polished, and finished up in every part, the soles blacked, and polished by the wheel with a composition of bees' wax and ivory black, which renders them glossy: the upper leathers are then brushed by a circular brush, which is turned by the lathe, and the shoes are rendered fit for sale, except those which require binding and lining, with a lining of thin leather, in which case they are finished in the same manner as common shoes.

The Society of Arts have shown a laudable desire to recommend various *machines* to the trade, to enable the workman perform his operations without so much sitting in a bent posture. The first of these was Mr. Holden's, then Mr. Parker's, and next Mr. Stas's, whose machine, being the most approved, demands some description. A small bench, or table, is firmly supported on four legs, at about four feet from the ground; a circular cushion is affixed upon the bench, having a hollow or basin in the centre of it, with a hole from the bottom of the hollow, quite through the cushion, and also through the centre of the bench. This hole receives a strap, which is doubled, and the two ends sewed together. The last is put into the double of the strap, and it is drawn down by a treadle, so as to hold the last firmly in the hollow of the cushion, which is stuffed soft within; and, as the hole through the cushion is too small for the shoe to pass down, the last can be set in any direction which is most convenient for the sewing; but, by relieving the treadle, it can be removed in an instant, turned round, and fixed again to sew another part. A seat can be applied in front of the machine, for the workman to rest himself occasionally: this seat is supported by only two legs, and a piece of wood, which projects horizontally from beneath the seat, and enters into a mortise, made in a part of the frame. Upon this the workman sits astride, as if upon a saddle; and, as his work is held before him at a proper height, he sits in an upright posture, which is not attended with the same prejudicial effects as stooping to work upon the knee. The machine is provided with a small tray, or box, behind the cushion, to contain all the small articles which the work requires; also a drawer beneath it for tools, &c.; a whetstone fixed up at a convenient height; and an anvil, which fits into the hollow of the cushion, so as to lie firmly, to hammer the leather upon instead of a lapstone.

SHOE OF AN ANCHOR, a small block of wood, convex on the back, and having a small hole, sufficient to contain the point of the anchor fluke, on the fore-side. It is used to prevent the anchor from tearing or wounding the planks on the ship's bow, when ascending or descending; for which purpose the shoe slides up and down along the bow, between the fluke of the anchor and the planks, as being pressed close to the latter by the weight of the former.

TO SHOE AN ANCHOR, is to cover the flukes with a broad triangular piece of plank, whose area or superficies is much larger than that of the flukes. It is intended to give the anchor a surer hold of the bottom in very soft and oozy ground.

SHOEING, in farriery. Horses, and other animals destined to labor, are shod with iron, in order to defend and preserve their hoofs. As feet differ, so should shoes.

In a treatise on this subject, by Mr. Clark of Edinburgh, the common form of shoes and the method of shoeing are, with great reason, condemned, and a new method recommended, which seems founded on rational principles, and to have been confirmed by experience. 'In preparing the foot for the shoe according to the common method,' our author observes, 'the frog, the sole, and the bars or binders, are pared so much that the blood frequently appears. The common shoe by its form (being thick on the inside of the rim, and thin upon the outside) must of consequence be made concave or hollow on that side which is placed immediately next the foot, in order to prevent its resting upon the sole. The shoes are generally of an immoderate weight and length, and every means is used to prevent the frog from resting upon the ground, by making the shoe heels thick, broad, and strong, or raising cramps or caulkers on them. From this form of the shoe, and from this method of treating the hoof, the frog is raised to a considerable height above the ground, the heels are deprived of that substance which was provided by nature to keep the crust extended at a proper wideness, and the foot is fixed as it were in a vice. By the pressure from the weight of the body, and resistance from the outer edges of the shoe, the heels are forced together, and retain that shape impressed upon them, which it is impossible ever afterwards to remove; hence a contraction of the heels, and of course lameness. But farther:—

'The heels being forced together, the crust presses upon the processes of the coffin and extremities of the nut-bone: the frog is confined, and raised so far from the ground that it cannot have that support upon it which it ought to have: the circulation of the blood is impeded, and a wasting of the frog, and frequently of the whole foot, ensues. Hence proceed all those diseases of the feet known by the names of founder, hoof-bound, narrow heels, thrushes, corns, high-soles, &c. The bad effects of this practice are still more obvious upon the external parts of the hoof. The crust towards the toe, being the only part of the hoof free from compression, enjoys a free circulation of that fluid necessary for its nourishment, and grows broader and longer; from which extraordinary length of toe, the horse stumbles in his going, and cuts his legs. The smaller particles of sand insinuate themselves between the shoe and the heels, which grind them away, and thereby produce lameness. All this is entirely owing to the great spring the heels of the horse must unavoidably have upon the heels of a shoe made in this form. This concave shoe in time wears thin at the toe, and, yielding to the pressure made upon it, is forced wider, and of consequence breaks off all that part of the crust on the outside of the nails. Instances of this kind daily occur, insomuch that there hardly remains crust sufficient to fix a shoe upon.

'It is generally thought that the broader a

shoe is, and the more it covers the sole and frog, a horse will travel the better. But, as has been formerly remarked, the broader a shoe is of this form, it must be made the more concave; and, of consequence, the contracting power upon the heels must be the greater. It is likewise to be observed that, by using strong broad-rimmed concave shoes in the summer season, when the weather is hot and the roads very dry and hard, if a horse is obliged to go fast, the shoes, by repeated strokes (or friction) against the ground, acquire a great degree of heat, which is communicated to the internal parts of the foot; and, together with the contraction upon the heels occasioned by the form of the shoe, must certainly cause exquisite pain. This is frequently succeeded by a violent inflammation in the internal parts of the hoof, and is the cause of that disease in the feet so fatal to the very best of our horses, commonly termed a founder. This is also the reason why horses, after a journey or a hard ride, are observed to shift their feet so frequently, and to lie down much. If we attend further to the convex surface of this shoe, and the convexity of the pavement upon which horses walk, it will then be evident that it is impossible for them to keep their feet from slipping in this form of shoe, especially upon declivities of the streets.

‘It is also a common practice to turn up the heels of the shoes into what are called cramps or caukers, by which means the weight of the horse is confined to a very narrow surface, viz. the inner round edge of the shoe-rim and the points or caukers of each heel, which soon wear round and blunt; besides, they for the most part are made by far too thick and long. The consequence is, that it throws the horse forward upon the toes, and is apt to make him slip and stumble. To this cause we must likewise ascribe the frequent and sudden lameness horses are subject to in the legs, by twisting the ligaments of the joints, tendons, &c. I do not affirm,’ says our author, ‘that caukers are always hurtful, and ought to be laid aside: on the contrary, I grant that they, or some such-like contrivance, are extremely necessary, and may be used with advantage upon flat shoes where the ground is slippery; but they should be made thinner and sharper than those commonly used, so as to sink into the ground, otherwise they will rather be hurtful than of any advantage.’

‘In shoeing a horse, we should in this, as in every other case, study to follow nature: and certainly that shoe which is made of such a form as to resemble, as near as possible, the natural tread and shape of the foot, must be preferable to any other. But it is extremely difficult to lay down fixed rules with respect to the proper method to be observed in treating the hoofs of different horses: it is equally difficult to lay down any certain rule for determining the precise form to be given to their shoes. This will be obvious to every judicious practitioner, from the various constructions of their feet, from disease, and from other causes that may occur; so that a great deal must depend upon the discretion and judgment of the operator, in proportioning the shoe to the foot, by imitating the natural tread, to prevent the hoof from contracting a bad shape.

‘It is to be remembered that a horse’s shoe ought by no means to rest upon the sole, otherwise it will occasion lameness; therefore it must rest entirely on the crust: and, in order that we may imitate the natural tread of the foot, the shoe must be made flat (if the height of the sole do not forbid it); it must be of an equal thickness all around the outside of the rim; and, on that part of it which is to be placed immediately next the foot, a narrow rim or margin is to be formed, not exceeding the breadth of the crust upon which it is to rest, with the nail-holes placed exactly in the middle; and from this narrow rim the shoe is to be made gradually thinner towards its inner edge.

‘The breadth of the shoe is to be regulated by the size of the foot, and the work to which the horse is accustomed: but, in general, it should be made rather broad at the toe, and narrow towards the extremity of each heel, in order to let the frog rest with freedom upon the ground. The necessity of this has been already shown. The shoe being thus formed and shaped like the foot, the surface of the crust is to be made smooth, and the shoe fixed on with eight or at most ten nails, the heads of which should be sunk into the holes, so as to be equal with the surface of the shoe. The sole, frog, and bars, as I have already observed, should never be pared, farther than taking off what is ragged from the frog, and any excrescences or inequalities from the sole. And it is very properly remarked by Mr. Osmer, ‘That the shoe should be made so as to stand a little wider at the extremity of each heel than the foot itself: otherwise, as the foot grows in length, the heel of the shoe in a short time gets within the heel of the horse; which pressure often breaks the crust, and produces a temporary lameness, perhaps a corn.’ But so much are farriers, grooms, &c., prejudiced in favor of the common method of shoeing and paring out the feet, that it is with difficulty they can even be prevailed upon to make a proper trial of it. They cannot be satisfied unless the frog be finely shaped, the sole pared, and the bars cut out, in order to make the heels appear wide. This practice gives them a show of wideness for the time; yet that, together with the concave form of the shoe, forwards the contraction of the heels, which, when confirmed, renders the animal lame for life.

‘In the flat form of shoe, its thickest part is upon the outside of the rim, where it is most exposed to be worn; and, being made gradually thinner towards its inner edge, it is therefore much lighter than the common concave shoe: yet it will last equally as long, and with more advantage to the hoof; and, as the frog or heel is allowed to rest upon the ground, the foot enjoys the same points of support as in its natural state. It must therefore be much easier for the horse in his way of going, and be a means of making him surer footed. It is likewise evident that, from this shoe, the hoof cannot acquire any bad form; when, at the same time, it receives every advantage that possibly could be expected from shoeing. In this respect it may very properly be said that we make the shoe to the foot, and not the foot to the shoe; as is but too much the case in the concave-shoes, where the foot

very much resembles that of a cat's fixed into a walnut-shell. It is to be observed that the hoofs of young horses, before they are shod, for the most part are wide and open at the heels, and that the crust is sufficiently thick and strong to admit of the nails being fixed very near the extremities of each. But, as I have formerly remarked, from the constant use of concave shoes, the crust of this part of the foot grows thinner and weaker; and when the nails are fixed too far back, especially upon the inside, the horse becomes lame: to avoid this, they are placed more towards the fore-part of the hoof. This causes the heels of the horse to have the greater spring upon the heels of the shoe, which is so very detrimental as to occasion lameness; whereas, by using this flat form of shoe, all these inconveniences are avoided; and if the hoofs of young horses, from the first time that they were shod, were continued to be constantly treated according to the method here recommended, the heels would always retain their natural strength and shape.

‘It has been alleged that, in this form of shoe, horses do not go so well as in that commonly used. This objection will easily be set aside, by attending to the following particulars. There are but few farriers that can or will endeavour to make this sort of shoe as it ought to be. The iron, in forming it, does not so easily turn into the circular shape necessary as in the common shoe; and, perhaps, this is the principal reason why they object to it, especially where they work much by the piece. And, as many horses that are commonly shod with concave shoes have their soles considerably higher than the crust, if the shoe is not properly formed, or if it is made too flat, it must unavoidably rest upon the sole, and occasion lameness. The practice of paring the sole and frog is also so prevalent, and thought so absolutely necessary, that it is indiscriminately practised, even to excess, on all kinds of feet; and, while this method continues to be followed, it cannot be expected that horses can go upon hard ground (on this open shoe) with that freedom they would do if their soles and frogs were allowed to remain in their full natural strength. There is one observation I would farther make; which is, that the shoe should be made of good iron, well worked, or what smiths call hammer-hardened, that is, beaten all over lightly with a hammer when almost cold. The Spanish and Portuguese farriers use this practice greatly, insomuch that many people, who have seen them at work, have reported that they form their horses' shoes without heating them in the fire as we do. It is well known that heating iron till it is red softens it greatly; and, when shoes thus softened are put upon horses' feet, they wear away like lead. But, when the shoes are well hammered, the iron becomes more compact, firm, and hard; so that a well-hammered shoe, though made considerably lighter, yet will last as long as one that is made heavier; the advantage of which is obvious, as the horse will move his feet with more activity, and be in less danger of cutting his legs.

‘The common concave shoes are very faulty

in this respect: for, in fitting or shaping them to the foot, they require to be frequently heated, in order to make them bend to the unequal surface, which the hoof acquires from the constant use of these shoes: they thereby become soft: and to attempt to harden them by beating or hammering when they are shaped to the foot would undo the whole. But flat shoes, by making them, when heated, a little narrower than the foot, will, by means of hammering, become wider, and acquire a degree of elasticity and firmness which it is necessary they should have, but impossible to be given them by any other means whatever; so that any farrier, from practice, will soon be able to judge, from the quality of the iron, how much a shoe, in fitting it to the circumference of the hoof, will stretch by hammering when it is almost cold: this operation, in fitting flat shoes will be the less difficult, especially when it is considered that, as there are no inequalities on the surface of the hoof (or at least ought not to be) which require to be bended thereto, shoes of this kind only require to be made smooth and flat; hence they will press equally upon the circumference or crust of the hoof, which is the natural tread of a horse.’

Mr. Moorcroft, a late ingenious veterinary practitioner in London, avowed a preference to this kind of shoe, which he calls the ‘seated shoe,’ and which he formed in a die, in the same manner that money is struck in coining. His account of it is as follows:—‘The shoe best calculated to answer the purpose,’ says he, ‘is that so strongly recommended by Mr. Osmer and Mr. Clark. The upper surface of this shoe consists of two parts: an outer part, which is a perfect plane near the rim, corresponding with the breadth of the crust, and called the seat; and an inner part, sloping from the seat, and distinguished by the name of the bevel. The seat is obviously intended to support the crust in its whole extent, the bevel to lie off the sole; and this part, being more or less broad, according to the kind of work proposed to be done, will give the requisite strength to the shoe. As the whole of the crust bears on the seat, it is less liable to be broken than when only a small part of it rests on the shoe. In consequence, likewise, of the crust resting on the flat seat, the weight of the body has a tendency to spread the foot wider in every direction, rather than to contract it, as has been observed to happen with the common shoe: and it has in fact been found, in various instances, that a foot contracted by the common shoe, and afterwards shod with the seated one, has become wider without the horse having been taken from his usual work; and again, that a foot, being of a full size and proper form when first shod with the seated shoe, has retained the same size and form, without the slightest alteration, as long as the seated shoe was used. By the slope or bevel in the shoe, a cavity is formed between it and the sole, sufficient to admit a picker, and to prevent pressure on this part, without the sole itself being hollowed, and consequently weakened. For if it be one of the functions of the horny sole to defend the sensible sole, of which, from its situation and nature, no one can doubt, it must

be evident, that the more perfect it is left, the stronger it must necessarily be, and of course the more competent to perform its office.'

Mr. Coleman, however, states as objections, that the sole may be pressed by this form of the shoe, and that the flat part of the shoe is made of the same breadth at the quarters as at the toe. These objections, however, bear rather on an imperfect practice, than an erroneous principle, in Osmer's mode of shoeing, as may be seen above, where direction is given to slope or bevel the shoe, that a cavity may be formed between it and the sole. But the grand objection of the smiths, probably, to Osmer's shoe, subsists in its being somewhat more difficult to forge than the common one to which they have been accustomed.

Professor St. Bel, who has not on all points reasoned so correctly, observes, 'that the feet of horses at their inferior surface are naturally concave, flat, or convex. Suppose, for instance, a foot well formed and properly concave; a second flat; and a third convex. The inconveniences attending the convex and flat foot will be considerably increased by shoes with a similar surface, because the iron of the shoe being harder than the horn of the hoof presents a smoother and more polished surface, and, consequently, more liable to slip. On this account, therefore, it is, that I have proposed the concave shoe, that is to say, concave in its lower surface, because it represents the natural shape of the foot, and because it fulfils, in every respect, the views and intentions of nature; and I am therefore convinced that it ought to be applied to all good feet. As some cases are to be excepted from every general rule, so here the use of the concave shoe is to be excepted from the case of a flat foot, and especially of a convex one: but it does not follow from this exception that the use of this shoe may not become general in time; because it must be remembered that feet only become flat and convex through bad shoeing, or by some accident, as when a horse is foundered; and that no horses, not even those bred in marshy and low lands, are foaled with this imperfection. Nor can we be justified in accusing nature with having neglected to provide sufficiently for the foundations of this admirable machine, when at the same time the same machine affords us so many convincing proofs both of her wisdom and her providence. It is also of principal importance to determine the weight of the shoe; for it is matter of astonishment to see some horses with shoes weighing each five pounds, making together a burden of twenty pounds of iron attached to their four feet. It is obvious to common sense that such an additional weight fixed to the extremity of the leg must be productive of some inconvenience or other; and, in fact, the muscles are thereby compelled to greater exertion, the ligaments are stretched, and the articulations continually fatigued: and, besides all these evil consequences, the shoe by its weight forces out the nails, and so entirely spoils the texture of the wall, or crust, that it becomes often extremely difficult to fix the shoe to the hoof. The weight which we propose for shoes of different kinds is nearly as follows:

	lb. oz.
1. For the strongest sort of cart-horses	2 12
2. For the smaller horses of this kind	1 12
3. For the largest coach-horses	1 12
4. For the smaller ditto	1 4
5. For saddle-horses of any height	1lb. 2oz. to 10
6. For race-horses	5 oz. to 4

By reducing the superfluous breadth of these shoes, their thickness may be increased without making any addition to their weight.'

Mr. Coleman expresses his sentiments of the shoe proposed by Mr. St. Bel in the following words:—'Mr. St. Bel employed a shoe with a flat upper surface; but, from not attending to the very important operation of removing the sole under the heels of the shoe, to every kind of hoof, it frequently failed of success.

'The best form for the external surface of the shoe is a regular concavity; that is, the common shoe reversed. This shoe leaves the hoof of the same figure when shod as before its application. And it is evident that a concavity has more points of contact with pavement and other convex bodies than a flat or convex surface, and that the horse is consequently more secure on his legs. A shoe that is flat externally may preserve the hoof equally well in health; but this form is not so well calculated to prevent the horse from slipping as a concavity. There are two circumstances necessary to be attended to in shoeing, viz. to cut the hoof and apply the shoe. Before the hoof is protected by iron, some parts require to be removed, and others preserved. This is even of more importance than the form of the shoe. But many have attended chiefly to the shoe, and not to its application, or to the hoof; and this error has produced more mischief, and more enemies to the Veterinary College, than all the prejudices and calumnies of grooms and farriers. The first thing to be attended to is to take away a portion of the sole between the whole length of the bars and crust, with a drawing-knife; for the heels of the sole cannot receive pressure without corns. To avoid this, the sole should be made concave, so as not to be in contact with the shoe. If there be any one part of the practice of shoeing more important than the rest, it is this removal of the sole, between the bars and crust. When this is done, the horse will always be free from corns, whatever may be the form of the shoe. Besides this, the heels of the shoe should be made to rest on the junction of the bars with the crust: whereas, if the bars are removed, the shoe is supported by the crust only, and not by the solid broad basis of crust and bars united.

'It is necessary that the sole should be cut before any other part of the hoof be removed. If the heels have been first lowered by the butteris, then possibly there may not be sufficient sole left to enable a drawing-knife to be applied, without reaching the sensible sole; whereas, by cutting the sole in the first instance, we can determine on the propriety of lowering the heels and shortening the toe. The sole can then descend, without the motion being obstructed by the shoe; and any foreign bodies that may have got into this cavity are always forced out when the sole descends, without producing any mischief.

When the shoe is applied, the cavity between the sole and shoe should be sufficiently large at every part to admit a large horse picker, and particularly between the bars and crust. If the sole is naturally concave, a shoe with a flat surface applied to the crust will not touch any part of the sole; and if the sole be flat, or even convex in the middle, or towards the toe, the quarters and heels of the sole will generally admit of being made concave with a drawing-knife, so as not to receive any pressure from a flat shoe. If a shoe with a flat upper surface does not leave ample space for a picker, between the sole and shoe, then it is requisite to make either the sole or the shoe concave. When the sole appears in flakes, and thick in substance, it will be better to make the whole of the sole concave by a drawing-knife; and this operation should always be performed before the toe is shortened or the heels lowered. When we have made the sole hollow, then a shoe with a flat surface will rest only on the crust; but if the sole be flat, or convex, and thin towards the toe and middle of the hoof, so as to prevent the possibility of removing the sole at these parts to form a concavity, then it is necessary to employ a shoe sufficiently concave to avoid pressure, and to admit a picker. In this case, however, the sole at the heels and quarters, even in convex feet, will generally allow of removal with a drawing-knife, and then the quarters and heels of the shoe may be flat. It therefore follows that, where the sole can be made concave, a shoe with a flat surface may with safety be applied; but where parts of the sole, from disease or bad shoeing, become flat, a shoe with a concave surface is required. As the hoof is always growing, and as the shoe preserves it from friction, the toe of the crust requires to be cut once in about twenty-eight days. The more horn we can remove from this part, the sooner it will be proper to apply a shoe thin at the heels, without mischief to the muscles and tendons, and the horse will be less liable to trip.

* The bars and frog should never be removed. What is ragged and detached had better be cut off with a knife by the groom than left to the farrier, who will perhaps remove some of the sound parts. Where the frog is not large and projecting, the heels may be lowered by a rasp or the butteris; for in every case we are to endeavour to bring the frog in contact with the ground. The frog must have pressure or be diseased. See FROG. Nevertheless, when the frog has been disused for a considerable period, and become soft, it must be accustomed to pressure by degrees. If the quarters are high, and much exceed the convexity of the frog, we should gradually lower the heels, and endeavour to bring the frog and heels of the shoe on the same parallel line. Where work is required of the horse, while the frog is soft and diseased, it may be gradually used to pressure, by lowering the hoof about the tenth of an inch every time of shoeing, until the frog be hard, and equally prominent with the heels; or, if the horse is not wanted, great advantage would be derived from his standing without shoes on a hard pavement. After the hoof has been properly prepared, then it is requisite to apply a shoe, and to vary

its length, breadth, and thickness, at the heel, surfaces, &c., according to the hoof. If the heels of the fore feet are two inches and a half or more in depth, the frog sound and prominent, and the ground dry, then only the toe of the hoof requires to be shortened, and afterwards protected by a short shoe made of the usual thickness at the toe, but gradually thinner towards the heel. For a common sized saddle-horse it may be about three-eighths of an inch thick at the toe, and one-eighth at the heel. The intention is, to bring the frog completely into contact with the ground, to expand the heels, prevent corns, thrushes, and canker. If applied in May or June, when the ground is dry, it may be continued all the summer; and in warm climates, where this is the case, no other protection for the hoof is requisite.

The professor here observes that, so long as the wear of the hoof is not greater than the supply afforded by nature from the coronet, so long may the short shoes be worn; but in wet weather this is not the case. 'I have known,' says he, 'some light horses to wear them the whole year; but such instances are not common. Nevertheless, the short shoe can be employed on most horses with advantage in summer, when the heels are from two and a half to three inches in depth, and the frog equally prominent; but, unless the hoof has been properly preserved, the heels and frog are generally too low for the short shoe. The toe of the horse requires to be shortened as much as possible; but, if the frog touches the ground, no part of the heels should be cut; and, by pursuing this practice, the heels will frequently grow sufficiently high to receive the short shoe.'

Mr. Lawrence, on the other hand, in his Philosophical and Practical Treatise on Horses, questions, on various grounds, the correctness of the term pressure, as of late years applied to the frog of the horse's foot; asserting that, in great numbers of feet, in their natural and healthy state, the frog is not of sufficient growth or bulk for such purpose; and that the frogs of most horses, even amply furnished by nature with that part, are too sensible and tender to admit of being exposed to constant contact with the hard roads, for which, however, he is a strenuous advocate whenever practicable, as he is for the concavity of the external surface of the shoe, the discovery of which he attributes not to St. Bel, but to Caesar Fiaschi, who lived many centuries past. Mr. Lawrence observes—'By the experiment of weakening or lowering the shoe heels, in order to bring a deficient frog into contact with the ground, however gradually I proceeded, I have lamed several horses. St. Bel also did the same, on the first establishment of the Veterinary College. It is sufficiently obvious that, by such means, the back sinews, as they are commonly styled, must be exposed to unusual extension. Such a plan is perhaps scarcely ever eligible, excepting indeed when necessary to reduce the feet to their proper level, in the fortunate case of a natural luxuriance of growth in the frog, which it is the epidemic madness of farriers and smiths to cut away, in order to the miserable and useless substitute of a thick-heeled shoe. The friction of our

hard roads, indeed of any roads, will always keep within bounds the most luxuriant frogs. In the first shoeing a colt, it is of the utmost importance that his frogs, if he have a sufficient growth of them, which is not always the case, be brought to touch the earth, not, however, by the use of any measures of force, or of setting the foot in an unnatural or uneven position: the paring around, or moderately lowering the crust of the foot, when so deep as to compress and injure the growth of the frog, is yet not only perfectly safe, but highly necessary. It will soon appear whether the horse's frogs and heels be of that nature to endure the concussion of the hard roads, which most assuredly, notwithstanding much confident assertion, too many never can endure; and, if a bruised frog be not very common, all practical horsemen are enough convinced how extremely liable the heels of horses are to contusion and inflammation. In bad cases of this kind, the only, and too much neglected, remedy of the bar-shoe has been already appreciated: in general, to set such feet upon their natural level, all which ought to be attempted, will require shoe-heels of considerable strength.

This author professes to be unaware of any essential improvement of the shoe of Osmer, with the exception of the revival by St. Bel of the concave external surface, notwithstanding the numerous variations which have been attempted; and represents the shoes of Osmer and Clark, already described, as still of the highest repute; those of the superior kind of farriers being imitations of the former in certain degrees; whilst those of the lower smiths, especially of the country, resemble yet too much the convex surface, internal concavity, inordinate length, and weight of former days.

Mr. Moorcroft formerly published a pamphlet, consisting chiefly of the directions of the French Veterinary School, for preventing a horse from 'striking the foot or shoe against the opposite leg.' This accident happens to the horse in two modes, by which he either strikes the pastern joint, or the shank above, near the inside of the knee: the old English stable terms in this case were knocking, applied to the pastern, and the speedy cut to the shank above. These revived directions produced no more success, nor so much attention, as they originally experienced, and for the following reasons, assigned by Mr. John Lawrence, just quoted, a writer allowed on all hands to be practical. The general cause of knocking and cutting in the horse is mal-conformation, crookedness of the pastern joints, and the toe pointing inward or outward, whence he will strike the opposite leg with either the toe or heel, even if ridden without shoes. Width of chest is no kind of security against this defect: and if any preventive measures by shoeing, recommended by Moorcroft and others, which, beside, have the disadvantage of placing the horse in an unnatural and dangerous position, may have a temporary good effect, it ceases the instant the horse becomes, in the smallest degree fatigued and leg-weary, and even, perhaps, after a few miles travel. On this account, the possessors of horses which wound their legs in action have generally, in former days, and at present,

been under the necessity of adopting the leathern guard as their only resource. The same author disputes, on his own experience, the idea promulgated of late, that the running thrush on the horse's foot is invariably caused by bad shoeing, averring that it is often a constitutional defect in the horse; questions the utility of the ancient practice lately revived, of exposing the naked feet of horses to stone pavement, with the view of hardening them; and strongly reprobates another revival of the practice of unenlightened times, on the obvious principles of quackery, namely, the barbarous and useless mechanical extension of naturally narrow heels.

Mr. Bracy Clark, a respectable veterinary surgeon, has published certain experiments on the foot of the living horse. His object appears to be the partial or total abolition of the use of the iron shoe. Whenever the roads are covered with ice, it becomes necessary to have the heels of a horse's shoes turned up, and frequently sharpened, in order to prevent him from slipping and falling: but this cannot be done without the frequent moving of the shoes, which breaks and destroys the crust of the hoof where the nails enter. To prevent this, it is recommended to those who are willing to be at the expense to have steel points screwed into the heels or quarters of each shoe, which might be taken out and put in occasionally. The method of doing this properly, as directed by Mr. Clark, is first to have the shoes fitted to the shape of the hoof, then to make a small round hole in the extremity of each heel, or in the quarters, about three-eighths of an inch in diameter, or more, in proportion to the breadth and size of the shoe; in each of these holes a screw is to be made: the steel points are likewise to have a screw on them, exactly fitted to that in the shoes. Care must be taken that the screw on the points is no longer, when they are screwed into the shoe, than the thickness of the latter. The steel points are to be made sharp; they may either be made square, triangular, or chisel pointed, as may be most agreeable; the height of the point above the shoe should not exceed a quarter of an inch for a saddle horse; they may be made higher for a draught horse. The key or handle that is necessary to screw them in and out occasionally is made in the shape of the capital letter T, and of sufficient size and strength. At the bottom of the handle a socket or cavity must be made, properly adapted to the shape of the steel point, and so deep as to receive the whole head of the point that is above the shoe. In order to prevent the screw from breaking at the neck, it will be necessary to make it of a gradual taper; the same is likewise to be observed of the female screw that receives it, that is, the hole must be wider on the upper part of the shoe than the under part: the sharp points may be tempered or hardened, in order to prevent them from growing too soon blunt; but when they become blunt they may be sharpened as at first. These points should be unscrewed when the horse is put into the stable, as the stones will do them more injury in a few minutes than a day's riding on ice. A draught horse should have one on the point of each shoe, as that gives him a firmer footing in

drawing on ice; but for a saddle horse, when points are put there, they are apt to make him trip and stumble. When the shoes are provided with these points, a horse will travel on ice with the greatest security and steadiness, much more so than on causeway or turnpike roads, as the weight of the horse presses them into the ice at every step he takes.

Besides the common shoe for horses that have sound feet, there are also others of various shapes, determined by the necessity of the case, that is to say, by the different derangements and diseases to which the horse's foot is liable. Such, for instance, are what farriers call the covered, flat, or convex shoe; the patten shoe; the shoe for all feet, simple, double, and hinged; the shoe without nails; the half-moon shoe; the Turkish shoe; and the slipper shoe. Eight nails for each shoe are enough for saddle and light draught horses; but, for such as are employed in heavy draught, ten are required. A smaller number, it is found, do not hold the shoe sufficiently fast; and a greater number, by acting like so many wedges, weaken the hoof, and rather dispose the crust to break off than give additional security.

The manner of disposing the nails has differed considerably at different times. Some writers have directed four to be placed on each side of the foot, and the hindmost near the heel: leaving between the two rows of nails a considerable space of the fore part of the foot without any. The nails thus placed certainly confined the foot at the sides and heels, left the toe at liberty, and assisted materially the effect of the sloping surface of the common shoe, in altering the form of the foot from nearly a round to a lengthened figure. Latterly, it has been strongly recommended to place the nails principally at the fore part of the foot, in order to prevent the heels from being confined. And certainly this is a wiser practice than the former; but, as the foot should rest on the shoe in the whole extent of the crust, it may be thought that the best way of connecting them in every part alike would be that of placing the nails at equal distances from each other in the whole round of the shoe.

However, the objection to this is, that when the foot strikes the ground with considerable force, the back part of it becomes a little broader than when it is in the air, or when the foot is at rest. This spreading is not considerable, nor does it extend far along the sides of the foot, but it is sufficient to act upon the hindmost nails, when near the heels; hence arises the necessity for there being a greater distance between the last nail and the heel of the shoe than between any two nails. Accordingly it may be laid down as a general rule that the last nail should not be nearer the heel than from two inches to an inch and a half. Such a distance has been found sufficient to prevent the heels being confined, and not sufficiently great to allow the shoe to spring, and loosen the last nails, as frequently happens when they are farther distant from the heel.

All the nails should be at equal distances from each other, except the two in front, which should be a little wider apart than the rest; this, however, is not a matter of essential consequence;

but it is of importance that there should not be any nail in the middle of the toe. For, generally, the action of the foot on the ground has a direct tendency to push the shoe, as it were, backwards along the foot; and it sometimes happens that the shoe is actually thus displaced; in which case, it necessarily follows that the nail in the middle of the toe must be driven immediately against the sensible parts behind it; whilst the rest of the nails, in great measure, follow the line of the crust, and so avoid doing mischief to the parts within. The nail-holes on the upper surface of the shoe should come through the seat, close to the edge of the bevel, that the nails may have a proper and equal hold on every part of the crust, which will be shown by the clenched ends being each equally distant from the shoe. As the nail-hole is always made with a taper and square pointed punch, a nail with a head of the same form will fit it better than one of any other shape.

To prevent the necessity of frequent removes, several expedients have been put in practice. Sometimes a few nails, of a larger size than the rest, have been so put in that the heads stood considerably beyond the level of the shoe; but when these did not break off, as was often the case, they soon wore down. At other times nails with large heads, tapering to a point, were screwed into the web of the shoe. Of these, one was usually placed at the toe, and one at each heel. And by this contrivance of the screw it was imagined that the nails might be easily replaced when worn out. They are apt, however, to break off at the neck, and are too expensive for common use. There is, notwithstanding, another plan, which, as far as it has been tried, justifies the author in recommending it. This consists in having nails with a lozenge head, or what may be called a double countersink, terminating in an edge, instead of coming to a point. This greater breadth of surface prevents its being rubbed away as fast as a point; the thickness in the middle gives it strength; and the regular taper to the shank causes it to apply exactly to the sides of the hole in the shoe, by which it is equally supported, and prevented from bending or breaking. There should be four nails to every shoe; that is to say, two in the forepart, and one at each heel.

The heads of these nails must be struck in tools, or dies; the four holes in the shoe must be made to correspond with the neck of the nail; and, when the nail is driven, the workman must cover the head with a tool, which will receive its upper part, and prevent its being injured by the hammer. These nails are, in effect, so many caulking, with the advantages of allowing a more level tread; of being easily replaced, by putting new nails in the old holes; and, by being at a distance from the heel of the shoe, they are not so likely to hurt the opposite leg. The nails and nail-holes, however, employed at the Veterinary College, are very different from those in common use. The latter are stamped with a punch of a particular form: and, the heads being of a conical shape, are received into the nail-holes, so as to preserve their hold as long as the shoe exists. Mr. Spencer is the inventor of

these nails, which, though made of a more durable metal, are little more in price than the common sort.

'The head of the common nail,' says Mr. Coleman, 'is not conical, but nearly square and no part is received into the nail-hole. When the nail is driven into the shoe, up to the head, the farrier generally continues to hammer with great violence; and, as the nail-hole cannot admit the head, the texture of the nail contiguous to the head is shivered, and, in a few days, is broken:—whereas the head of Mr. Spencer's nail operates as a wedge; the more it is hammered, the more closely it is connected with the nail-hole, so as to become part of the shoe. Moreover, the head of the common nail, when not injured by the farrier, projects beyond the shoe; and, when worn out, the shoe is liable to come off. This accident will more frequently happen if the nails are placed in the old nail-holes of the crust, before the nail-holes of the shoe are punched, the farrier should examine the situation of the former nails; and, by having new crust for the nails, the shoe will be more firmly connected with the hoof.'

It now only remains for us to conclude with some few remarks on the shoeing of other animals employed in the service of man, and especially the mule, the ox, and the ass.

The shoe for the fore feet of the mule is, in general, very similar to that which the farriers call the bar shoe. It is very wide and large, especially at the toe, where it sometimes projects four inches and upwards beyond the hoof. This excess is given it with a view to enlarge the basis of the foot, which is in general exceedingly narrow in this animal. The shoe for the hind feet is open at the heels, like the horse's shoe; but it is lengthened at the toe, like the preceding one. The former is called in French *planche*, and the latter *florentine*. The foot of the ass, having the same shape as that of the mule, requires the same kind of shoe, with this only difference, that the shoe for the fore foot is not closed at the heels, and that its edges do not project so much beyond the hoof. The same form of shoe is used for the hind feet of this animal.

The ox's shoe consists of a flat plate of iron, with five or six stamp-holes on the outward edge to receive the nails; at the toe is a projection of four or five inches, which, passing in the cleft of the foot, is bent over the hoof, so as to keep the shoe in its proper place. In many parts of France, where the ox is used for draft, it is sometimes necessary to employ eight shoes, one under each nail; or four, one under each external nail; and sometimes only two, one under the external nail of each fore foot. In the description here given of the mule's and ass's shoe, we cannot avoid condemning the cruel and ignorant practice of extending the toe of the shoe so far beyond the toe of the hoof. See VETERINARY ART.

SHOOMSKA, one of the Kurile islands, three leagues south of Cape Lopatka, in Kamtschatka. Its inhabitants consist of a mixture of natives and Kamtschadales.

SHOOT, *v. a., v. n., &c.* Pret. I shot; *part.*

SHOOT'ER, *n. s.* [*n. s.*] shot or shotten. Sax.

rcēstan: Goth. *skiota*; Swed. *skiuta*. To put forth; emit; push forward; discharge any thing so as to make it fly with speed or violence; to perform the act of shooting; germinate; protuberate; be emitted; move along swiftly: as a noun substantive, the act or impression of any thing emitted: endeavour to strike, or act of striking with a missile; a branch from a main stock: a shooter is one who shoots, or uses a missile weapon.

The archers have sorely grieved him, and shot at him. *Genesis.*

Not an hand shall touch the mount, but he shall be stoned or shot through. *Exodus xix. 13.*

They that see me shoot out the lip, they shake the head. *Psalms.*

None of the trees exalt themselves, neither shoot up their top among the thick boughs. *Ezekiel xxxi. 14.*

A grain of mustard groweth up and shooteth out great branches. *Mark iv. 32.*

I owe you much, and, like a witless youth That which I owe is lost; but if you please To shoot an arrow that self way

Which you did shoot the first, I do not doubt To find both. *Shakspeare.*

This murderous shaft that's shot Hath not yet lighted; and our safest way Is to avoid the aim. *Id.*

The noise of thy cross-bow Will scare the herd, and so my shoot is lost. *Id.*

Such trees as love the sun do not willingly descend far into the earth; and therefore they are commonly trees that shoot up much. *Bacon.*

If the menstruum be overcharged, metals will shoot into crystals. *Id.*

The Turkish bow giveth a very forcible shoot, in-somuch as the arrow hath pierced a steel target two inches thick; but the arrow, if headed with wood, hath been known to pierce through a piece of wood of eight inches thick. *Id.*

They will not come just on the tops where they were cut, but out of those shoots which were water-boughs. *Id.*

The shooter ewe, the broad-leaved sycamore. *Fairfax.*

We are shooters both, and thou dost deign To enter combat with us, and contest With thine own clay. *Herbert.*

The men shoot strong shoots with their bows. *Abbot.*

The land did shoot out with a very great promontory, bending that way. *Id. Description of the World.*

The tree at once both upward shoots, And just as much grows downward to the roots. *Cleaveland.*

Tell like a tall old oak how learning shoots To heaven her branches, and to hell her roots. *Denham.*

Light Shoots far into the bosom of dim night A glimmering dawn. *Milton.*

A pomp of winning graces waited still, And from about her shot darts of desire Into all eyes to wish her still in sight. *Id.*

Materials dark and crude, Of spiritous fiery spume, till touched With heaven's ray, and tempered, they shoot forth So beauteous, opening to the ambient light. *Id.*

A shooting star in Autumn thwarts the night. *Id.* Where Tigris at the foot of Paradise Into a gulf shot under ground, till part Rose up a fountain by the tree of life. *Id.*

I saw them under a green mantling vine,
Plucking ripe clusters from the tender shoots. *Id.*

The two ends of a bow *shot* off, fly from one another. *Boyle.*

When he has *shot* his best, he is sure that none ever did *shoot* better. *Temple.*

Men who know not hearts should make examples,
Which, like a warning-piece, must be *shot* off,
To fright the rest from crimes. *Dryden.*

Ye who pluck the flowers,
Beware the secret snake that *shoots* a sting. *Id.*

I have laughed sometimes when I have reflected
on those men who have *shot* themselves into the
world; some bolting out upon the stage with vast
applause; and some hissed off, quitting it with disgrace. *Id.*

The liquid air his moving pinions wound,
And in the moment *shoot* him on the ground. *Id.*

Thus having said, she sinks beneath the ground
With furious haste, and *shoots* the Stygian sound. *Id.*

A shining harvest either host displays,
And *shoots* against the sun with equal rays. *Id.*

The monarch oak, the patriarch of the trees,
Shoots rising up, and spreads by slow degrees. *Id.*

New creatures rise,
A moving mass at first, and short of thighs;
Till *shooting* out with legs, and imp'd with wings. *Id.*

Let me but *live* to shadow this young plant
From blites and storms: he'll soon *shoot* up a hero. *Id.*

At first she flutters, but at length she springs
To smother flight, and *shoots* upon her wings. *Id.*

Heaven's imperious queen *shot* down from high;
At her approach the brazen hinges fly,
The gates are forced. *Id.*

As a country-fellow was making a *shoot* at a
pigeon, he trod upon a snake that bit him. *L'Estrange.*

Straight lines in joiner's language are called a
joint; that is, two pieces of wood, that are *shot*,
that is, planed, or else pared with a paring chisel. *Moron.*

That rude mass will *shoot* itself into several forms,
till it make an habitable world: the steady hand of
Providence being the invisible guide of all its motions. *Burnet's Theory.*

The last had a star upon its breast, which *shot*
forth pointed beams of a peculiar lustre. *Addison.*

The corn laid up by the ants would *shoot* under
ground, if they did not bite off all the buds; and
therefore it will produce nothing. *Id.*

This valley of the Tyrol lies inclosed on all sides
by the Alps, though its dominions shoot out into several
branches among the breaks of the mountains. *Id. on Italy.*

When you *shoot*, and shut one eye,
You cannot think he would deny
To lend the other friendly aid,
Or wink, as coward and afraid. *Prior.*

Where the mob gathers, swiftly *shoot* along,
Nor idly mingle in the noisy throng. *Gay.*

Expressed juices of plants, boiled into the con-
sistence of a syrup, and set into a cool place, the
essential salt will *shoot* upon the sides of the vessels. *Arbuthnot on Aliments.*

A wild where weeds and flowers promiscuous *shoot*,
Or garden tempting with forbidden fruit. *Pope.*

Not half so swiftly *shoots* along in air
The gliding lightning. *Id.*

Now should my praises owe their truth
To beauty, dress, or paint, or youth,
'Twere grafting on an annual stock,
That must our expectations mock;

And, making one luxuriant *shoot*,
Die the next year for want of root. *Swift.*

Tell them that the rays of light *shoot* from the sun
to our earth at the rate of one hundred and eighty
thousand miles in the second of a minute, they stand
aghast at such talk. *Watts.*

The grand aetherial bow
Shoots up immense. *Thomson.*
Fired by the torch of noon to tenfold rage,
The infuriate hill forth *shoots* the pillared flame. *Id.*

Pride pushed forth buds at every branching *shoot*,
And virtue shrunk almost beneath the root. *Harte.*

SHOOTING, among sportsmen, is the killing
of game by the gun, with or without the help of
dogs. It is now generally confined to flying or
running, especially the first; which, by experi-
ence, is found to be the best and most diverting
way of shooting; indeed there is scarcely any
other than these two in use now among gentle-
men, for few will watch by a river side to shoot
wild fowl; although, about a century ago, to
shoot flying was looked on as a rare accomplish-
ment in a sportsman. It is necessary for any
person who sports much to have two guns; the
barrel of one about two feet nine inches, which
will serve very well for the beginning of the sea-
son, and for wood-shooting; the other about
three feet three inches, for open-shooting after
Michaelmas; the birds by that time are grown
so shy that your shoots must be at longer dis-
tance. But, if you intend one gun to serve for
all purposes, a three-feet barrel, or thereabouts,
is most proper. You should always have it
cocked in readiness, holding your thumb over the
cock, lest it go off when you would not have it.

It is generally accounted the best way to aim
at the head, if the game fly over your head; but
to aim as it were under the belly, if it fly from
you; and it will be best to let the game fly a lit-
tle past you before you fire, for so doing the shot
will the better enter the body. Shot delivered
from a gun in general lose or decrease half the
quantity every ten yards, or thereabouts; so that
at forty yards there will not be thrown in above
a fourth of what would be into the same space at
twenty yards. From which it appears that, if
you take aim a foot before a cross shoot at forty
yards, you will be the most likely to meet the
bird with the centre shot; and which is looked
upon to fly the strongest, and to be the more
efficacious at long distances, than the diverging
shot; for, whatever be the cause of their diverg-
ing, it must in some degree retard their motion.
But, if there be a brisk wind, it will certainly
bend the course of the shot; you must therefore
consider, whether the wind blow with the bird,
or against it; if it blow with it, you need little
more than to observe the general rule; because
the wind helps the bird forward nearly as much
as it diverts the shot; but, if it fly against the
wind, the shot declines more than the bird is re-
tarded, and therefore you ought to take aim at a
greater distance before the bird.

One good pointer in the field at a time, if you
have patience to attend him, will be sufficient
for two men to shoot with; but if you have an
old spring spaniel, that is so well under com-
mand that you can always keep him near you,

such a dog may be used with your pointer with great advantage: as he will better find birds that are wounded, and also spring such as are near you, which you otherwise might pass. But if you should be fond of hunting many pointers together in a field, as is frequently done, you should not have more than one amongst them who has been taught to fetch his game; lest, by endeavouring to get it from each other, they should tear it. Two persons in the field with guns are better than more at partridge shooting; who should with patience pay a due attention to each other. When your dog points, walk up without any hurry, separating a few yards, one to the right, the other to the left of your dog: if a covey spring, never shoot into the midst of them, but let him on the left single out a bird which flies to the left, and him on the right a bird to the right, that you may not interrupt each other, nor both shoot at the same bird, and readily fire at the first aim. Let each of you mark the fall of his bird, and immediately run to the place; and if the dog do not secure it, or the bird should be only wounded, and have run, put him upon the scent; but if your dog understand his business, and will fetch his game, it is better to trust to him, and load again as quick as you can. It will always be of great use, and save much time and trouble, to have a person without a gun, to mark the flight of the birds. If a single bird be sprung, let him take the shoot to whose side it flies: the bird being killed, cause your dog to lie by it whilst you load, lest he spring other birds that are near you. If you trace the birds to a hedge, double the row by walking one on each side, taking your dog on the ditch side: here, if you have a spaniel, he will be of great use; as you may make him go along in the ditch, and your pointer on the other side; by which means you will not pass a bird, and one of you will most likely get a good shoot at it. Your own judgment, with very little experience, will best direct where the birds are most likely to be found at different times of the day, according to the grounds you have to hunt in. A fowling-piece should not be fired more than twenty or five-and-twenty times without being washed; a barrel, when foul, neither shoots so ready, nor carries the shot so far as when clean. The flint, pan, and hammer, should be well wiped after each shot; this contributes greatly to make the piece go off quick, but then it should be done with such expedition that the barrel may be re-loaded whilst warm. The flint should be frequently changed, without waiting till it misses fire before a new one is put in. Fifteen or eighteen shots, therefore, should only be fired with the same flint; the expense is too trifling to be regarded, and, by changing it thus often, much vexation will be prevented. A gun, also, should never be fired with the prime of the preceding day; it may happen that an old priming will sometimes go off well, but it will more frequently contract moisture and fuse in the firing; then the object will most probably be missed, and that because the piece was not fresh primed.

Some attention is requisite in loading a piece; the powder should be only slightly rammed

down, for which purpose it is sufficient to press the ramrod two or three times on the wadding, and not (as the usual practice is) to ram down the wadding by main force, by drawing up the ramrod, and then returning it into the barrel with a jerk of the arm, many successive times. For, by compressing the powder in this violent manner, some of the grains will necessarily be bruised, whilst the explosion will not be so quick, and the shot will be spread wider. In pouring the charge of powder into the barrel, care should be taken to hold the measure as much as possible in a perpendicular line, that the powder may the more readily fall to the bottom. It is even of service to strike the butt end of the gun gently on the ground, in order to detach those grains of powder, which, in falling down, adhere to the sides of the barrel. The shot should never be rammed down tight: after having given a stroke on the ground with the butt-end of the gun, in order to settle it, the same as for the powder, the wadding should then be gently put down, but much less close than that over the powder; for, when the shot is wadded too tight, it spreads wide, and the piece will recoil. In this, therefore, as well as in every other mode of loading, the sportsman should never carry his gun under his arm, with the muzzle inclined to the ground; that practice at all times loosens the wadding and charge too much: sometimes produces the loss of shot, and always indicates laziness in the shooter, and indifference to the sport.

When the piece is fired, it should, if possible, be reloaded immediately, whilst the barrel is warm, lest, by delaying it, a certain moisture should be formed in the barrel, which would retain a part of the powder when pouring in the charge, and hinder it from falling to the bottom. Powder, also, will imbibe moisture from the air, and, therefore, it is of additional advantage to load the piece whilst the barrel is warm, because some part of the moisture will be thereby evaporated. For the same reason, the sportsman should fire off a little powder before he loads the first time; for it has been found, even in the driest seasons, that the coldness of the barrel, and perhaps some little moisture condensed in its cavity, have sensibly diminished the force of the powder in the first discharge.

Some sportsmen prime before they load; this may be proper when the touch-hole is enlarged, and the barrel is very thin at that place, because, in this case, if the piece is not first primed, it will in loading prime itself, which diminishes the charge: but, when the touch-hole is of its proper size, the piece should never be primed until after it is loaded; for then it will be known, from the few grains of powder which usually make their way into the pan, that the touch-hole is clear and unobstructed; and, on the contrary, if no grains come through, that it will be proper to strike the butt-end of the gun smartly with the hand, and to prick the touch-hole till they appear. But, whether the practice is to prime before or after loading the piece, it is highly proper, after every discharge, to prick the touch-hole, and what is still better, to guard against all remains of fuse or squib, by inserting into

the touch-hole the feather of a partridge's wing, which will not only clear it of these dangerous remains, but, if the piece is delayed to be recharged, will take away all humidity that may be contracted there.

Every sportsman has his own manner of bringing his gun up to his shoulder, and of taking aim; and each follows his own fancy with respect to the stock of his fowling-piece, and its shape. Some like it long, others short; one prefers it straight, another bent. And, although there are some sportsmen who shoot equally well with pieces stocked in different ways and shapes, yet certain principles may be laid down as well upon what is the proper length, as upon the proper bent, that the stock of a gun should have. But in the application such principles are very frequently, nay, most commonly, counteracted, by the whim or the particular convenience of the shooter. Generally speaking, however, it is certain, that for a tall long-armed man the stock of a gun should be longer than for one of a less stature and shorter arm. That a straight stock is proper for him who has high shoulders, and a short neck; for, if it be much bent, it would be very difficult for him, especially in the quick motion required in shooting at a flying or running object, to place the butt of the gun-stock firmly to the shoulder; the upper part alone would in general be fixed, which would not only raise the muzzle, and consequently shoot high, but make the recoil more sensibly felt than if the whole end of the stock were firmly placed on the shoulder. Besides, supposing the sportsman to bring the butt home to his shoulder, he would scarcely be able to level his piece at the object. On the contrary, a man with low shoulders, and a long neck, requires a stock much bent: for, if it is straight, he will, in the act of lowering his head to that place of the stock at which his cheek should rest, in taking aim, feel a constraint, which he never experiences, when, by the effect of the proper degree of bent, the stock lends him some assistance, and, as it were, meets his aim half-way. Independently, however, of these principles, the application of which is subject to a variety of modifications, we venture to advise the sportsman in the choice of a fowling-piece, that a long stock is preferable to a short one, and, at the same time, rather more bent than usual; for a long stock sits firmer to the shoulder than a short one, and particularly so when the shooter is accustomed to place his left hand, which principally supports the piece, near to the entrance of the ramrod into the stock. The practice of placing that hand near the bridge of the guard is undoubtedly a bad one: the aim is never so sure, nor has the shooter such a ready command over his piece, as when he places his hand near the entrance of the ramrod, and at the same time strongly grasps the barrel; instead of resting it between his fore-finger and thumb, in conformity with the general custom. It may, therefore, be depended upon, that a stock bent a little more than ordinary is better for shooting true than one too straight, because the latter, in coming up to the aim, is subject to the inconvenience of causing the sportsman to shoot too high.

—We would also advise him to have his fowling-piece a little elevated at the muzzle, and the sight small and flat; for the experienced well know, that it is more usual to shoot low than high. It is, therefore, of service that a piece should shoot a little high, and then, the more flat the sight, the better the line of aim will coincide with the line of fire, and in consequence the gun will be less liable to shoot low.

The method by which to avoid missing a cross-shot, whether it be flying or running, is not only to take aim before the object, but likewise not involuntarily to stop the motion of the arms, at the moment of pulling the trigger; for the instant the hand stops in order to fire, although the space of time be almost imperceptible, the object, if a bird, gets beyond the line of aim, and the shot will fly behind it; and if a hare or rabbit be shot at in this manner, whilst running, and especially if at a distance, the animal will only be slightly struck in the buttocks, and will be taken but by hazard. When a bird, however, is flying in a straight line from the shooter, this fault can do no harm; the object can scarcely escape, if the piece be but tolerably well directed, unless, indeed, it is fired at the moment the game springs, and before the birds have taken a horizontal flight. In that case, if the hand stop ever so little at the instant of firing, the sportsman will shoot low, and inevitably miss the mark. It becomes, therefore, extremely essential to accustom the hand, in taking aim, to follow the object, without suspending the motion in the least degree, which is a capital point towards acquiring the art of shooting well: the contrary habit, which is very difficult to correct, when once contracted, prevents that person from attaining perfection in the art, who, in other respects, may eminently possess quickness of sight and steadiness of aim.

Nor is it less essential in a cross-shot to aim before the object in proportion to its distance, at the time of firing. If a partridge, for instance, fly across at the distance of thirty or five-and-thirty paces, it will be sufficient to take aim at the head, or, at most, but a small space before. The same rule will nearly hold in the cases of shooting quails, woodcocks, pheasants, or wild ducks, although these birds move their wings slower than the partridge. But, if the object be fifty, sixty, or seventy paces distant, it then becomes necessary to aim at least half a foot before the head. The same practice should be observed in shooting at a hare or rabbit when running in a cross direction, making due allowance for the distance, and for the swiftness of the pace, which is not always the same. It is also proper, in shooting at an object very distant, to take aim a little above it, because shots, as well as balls, have but a certain range in point blank, beyond which each begins to describe the curve of the parabola.

When a hare runs in a straight line from the shooter he should take his aim between the ears, otherwise he will run the hazard either of missing, or at least of not killing dead, or, as it is sometimes called, 'clean.' A true sportsman, who has the ambition of shooting well, is not content with only breaking the wing of a partridge, or the thigh of a hare, when he shoots at a fair distance

for, in such case, the hare or the partridge ought to be shot in such a manner that it should remain in the place where it falls, and not require the assistance of dogs to take it. But if he shoots at a great distance it is no reproach that the partridge is only winged, or the hare wounded, so that it cannot escape.

Practice soon teaches the sportsman the proper distance at which he should shoot. The distance at which he ought infallibly to kill any kind of game with patent shot (No. 3), provided the aim be well taken, is from twenty-five to thirty-five paces for the footed, and from forty to forty-five paces for the winged game. Beyond this distance, even to fifty or fifty-five paces, both partridges and hares are sometimes killed, but, in general, hares are only slightly wounded, and carry away the shot; and partridges, at that distance, present so small a surface, that they frequently escape untouched between the vacant spaces of the circle. Yet it does not follow that a partridge may not be killed with No. 3, patent shot, at sixty, and even seventy paces distance; but then these shots are very rare. Those who know the range of a fowling-piece, and the closeness of its shot, shrug up their shoulders at the romances of sportsmen who, according to their own accounts, daily kill with shot (No. 3) at the distance of ninety and 100 paces. Nay, some even go so far as to assert that they have killed, with this sized shot, hares at 110 paces, and pheasants at 120. It cannot, however, be denied, that with shot No. 5, a man may have killed a hare or a partridge at 110, or possibly at 120 paces; but then these shots are so extraordinary, and occur so seldom, that the whole life of a sportsman will scarcely afford more than two or three instances; and when it does happen it will be found to be by a single pellet, which, by great chance, has hit either the wing or the head of the partridge, or has struck the head of the hare, by which it is stunned, or perhaps has penetrated the small part of the shoulder, where there is, to prevent the wound being mortal, only a very thin skin, which, being stretched by the animal in running, is thereby rendered more easy to be pierced by the shot.

For expertness in finding the game a sportsman must pay attention to the difference of the seasons, and the weather; to the temperature of the air, and even to those hours of the day which are more or less favorable for shooting. In warm weather he should hunt for the game in plains and in open grounds, at the same time bearing in mind that, during the heat of the day, the birds frequent moist places, marshes where there is little water and much high grass, the sides of rivers and brooks, and hills exposed to the north. But, in cold weather, they will most commonly be found on little hills exposed to the south, along hedge-rows, among the heath, in stubbles, and in pastures where there is much furze and fern. In hard frosts they get into thickets, low places, and marshes, where they seek to shelter themselves from the cold, as well as the heat, in different seasons. The greatest part, however, of these rules will only apply when the weather is extremely hot or severely cold, at both of which times the hares and partridges almost to-

tally desert the plains and open grounds. The game is more easily approached, or, in the language of sporting, 'lies better,' in covert than in open places: a double advantage is therefore obtained by hunting for them in the former. He should, at all times of the shooting season, go out in the morning before the dew is off. At that time the shepherds and their flocks, the husbandmen and their teams, have not entirely spread over the fields, and have as yet sprung but a small quantity of game; the scents of the preceding night will also be more warm, and the dogs will hit them off better. Besides, if he be not early, he loses such opportunities of shooting as he will not meet again during the remainder of the day. All these advantages, therefore, greatly counterbalance the notion generally received, that, as the birds will not lie well while the ground is wet, the sportsman should not go out early in the morning, or before the dew is gone off.

The color of the dress which the shooter should wear is worthy of notice. Green is unquestionably the best in the early part of the season, whilst the leaves remain on the trees. For, if he be clad in a glaring color when the face of the country retains its verdure, the game will perceive his approach more easily, and from a greater distance. In winter, for the same reason, his dress should be composed of a dark brown, or some color resembling that of the dead leaf.

It is best to hunt as much as possible against the wind, not only to prevent the game from perceiving the approach of the sportsman and his dog, but also to enable the dog to scent the game at a greater distance. We say as much as possible, because in advancing and returning upon his steps in order to range the ground well, the shooter cannot always keep the advantage of the wind. When, therefore, it is proposed to hunt any particular tract of country in which game is expected to be found, it is indispensably necessary to take the wind, and it behoves the shooter to range and quarter his ground in such manner and direction as to preserve it in his favor.

He should never be discouraged from hunting and ranging the same ground over and over again, especially in places covered with heath, brambles, high grass, or young coppice-wood. A hare or rabbit will frequently suffer him to pass several times within a few yards of its form without getting up. He should be still more patient when he has marked partridges into such places; for it often happens that, after the birds have been sprung many times, they lie so dead that they will suffer him almost to tread upon them before they will rise. Pheasants, quails, and woodcocks do the same. He should always keep a sharp eye, and carefully look about him, never passing a bush or a tuft of grass without examination; but he should never strike either with the muzzle of his gun, for the reasons assigned where we speak of wadding. It is also proper to stop every now and then; for this interruption of motion frequently determines the game to spring, which would otherwise have suffered him to pass. He who patiently beats and ranges his ground over and over again, without being discouraged, will always kill the greatest

quantity of game; and, if he be shooting in company, he will find game where others have passed without discovering any. As soon as he has fired he should call in his dog, and make him lie down until he has re-loaded his piece; for, without this precaution, he will frequently have the mortification to see the game rise when he is not prepared to shoot.

In shooting in an open country, one of the most essential points to be observed is, to mark the place where the partridges alight; therefore, when he has killed his bird, he should not immediately run to pick it up, or attend to make his dog bring it to him, but he ought to follow the others with his eye until he sees them settle, or as far as his sight can extend, without interruption from a wood or a hedge. In the latter case, although he have not been able to distinguish the exact spot on which they have alighted, yet he may tolerably well guess whereabouts they are, especially if acquainted with the country in which he is shooting. And, when two or more sportsmen shoot in company, each should mark the birds which fly on his own side. These general rules will, with equal propriety, apply to all game of course or feather. We might next proceed to the detail of particular directions for hare and rabbit, partridge, pheasant, grouse, woodcock, snipe, and wild fowl shooting; but, as these would draw this article to too great a length, we shall conclude it with a few observations respecting guns, powder, and shot.

To make gun barrels of a fine brown color.—As a brown barrel seems to be the most pleasing to a sportsman, the following is a certain and easy method of giving it this hue:—Rub your barrel bright with sand paper, or if bright, scour it with dry brickdust to take off all greasiness, and fit a stick or piece of wood into the muzzle long enough to hold it by. Bruise roughly about half an ounce of stone-brimstone, and sprinkle it over a gentle fire either of wood, or coal, or charcoal; hold your barrel over the smoke, turning and drawing it backward and forward until it be equally tinged all over; this done, set it in a cellar or damp room till next day, in which time you will find it has thrown out a fine rust, over which you may draw your finger to spread it even, and let it stand another day. If you perceive any parts that have not taken the rust, scour such parts bright, and repeat the above operation. It is then to be polished with a hard brush (first rubbed with bees'-wax), and afterwards with a dry woollen or rough linen rag, which will make it look of a beautiful brown color. This rubbing must be repeated every day so long as it throws out any roughness. No oil or grease should come on it for some time, as that may bring off the rust in places; but if by neglect it should get so strong a roughness that you cannot get it down with common rubbing, in that case wipe it over with sweet oil, and rub it off gently with a clean linen rag, and the next day you may polish it down with your brush as before directed.

Directions for keeping your guns in order.—If your lock and furniture be bright, the best way to save the trouble, as well as to prevent the damage that may be done by unskilful polishing,

is never to suffer them to rust, which may easily be prevented by frequently rubbing all the bright parts with a small brush, dipped in sweet oil, which should be well rubbed off with a linen rag: and this should never be neglected both before and after using it. It is needless to take the lock often to pieces: if you take it off and brush it with plenty of oil, and pull up the cock and hammer a few times, the dirt with the oil will work itself out, which is to be wiped off, and a little clean oil put on those parts where there is any friction will answer the purpose.

To wash out the barrel.—Fill it either with cold or warm water, and empty it, and let it stand a few minutes, and the air and moisture will soften the soil left from the firing of the powder, so as to come off the easier. You may use sand with your rag or tow to wash it out, which will remove any of the soil that sticks hard to it without hurting its smoothness. Care must be taken to wipe it very dry, and, if it is to be set by for a time, it will be proper to wipe it out with an oily rag, and to stop the muzzle with the same, otherwise it will be apt to rust.

Of the stock, lock, &c.—The wood which is most commonly employed for the stock, and which appears the best for the purpose, is walnut. It is only necessary, however, to observe, that the grain be even and close, and as free as possible from knots and burs, which, though they may add to the beauty of the stock, seldom fail to take away from its strength, unless they are confined entirely to the butt part. As to the curvature, no particular degree can be assigned as a standard; different persons requiring different degrees, according to the length of their neck, and to the manner in which they hold their head whilst taking aim. This, however, as well as the length of the butt, which depends partly upon the circumstances just mentioned, but chiefly upon the length of the arms, can be determined with great accuracy by the gunsmith from observing the manner in which the shooter presents his piece and takes his aim.

With regard to the locks, we shall only observe that the genius and industry of the English workmen have already brought them to such a degree of elegance and perfection that we have scarcely any thing farther to hope for, or require. The real improvements are not confined to any particular maker; and, though the minutiae peculiar to each may determine the purchaser in his preference, no person need fear much disappointment in the essential qualities of a lock, provided he goes to the price of a good one. It is of much more consequence to the excellence of a lock, that the springs be proportioned to each other, than that they should all be made very strong. A moderate degree of force is sufficient to produce the required effect; and whatever exceeds this proves detrimental, by rendering the trigger difficult to draw, or producing such a stroke as breaks the flints, or throws the piece from the direction in which it was pointed. If the main-spring be very strong, and the hammer-spring weak, the cock is often broken for want of sufficient resistance to its stroke, until it is stopped all at once by the check of the lock-plate. Whilst, on the other hand, if the hammer-spring be stiff, and the main-

spring weak, the cock has not sufficient force to drive back the hammer. And, in both cases, the collision between the flint and steel is too slight to produce the necessary fire. The face of the hammer, also, may be too hard or too soft. The former is known by the flint making scarcely any impression upon it, and the sparks being few and very small. The latter by the flint cutting deep into the hammer at every stroke, whilst the sparks are also few in number, and of a dull-red color. When the strength of the springs, and the temper of the hammer, are in due degree, the sparks are numerous, brilliant, and accompanied with a considerable whizzing noise. To explain these differences, it is necessary to observe that the sparks produced by the collision of flint and steel are particles of the metal driven off in a strongly heated state, and which, falling among the powder, inflame it instantly. By snapping a gun or pistol over a sheet of white paper, we may collect these sparks, and, by submitting them to a microscope, demonstrate the fact. If the sparks be very brilliant, and accompanied with a whizzing noise, we shall find the particles collected on the paper to be little globules of steel, which have not only been melted, but have actually undergone a considerable degree of vitrification from the intensity of the heat excited by the collision, their surface exactly resembling the slag thrown out from an iron foundry. When the face of the hammer is too hard, the particles which the flint strikes off are so small that they are cooled before they fall into the pan; and, when the hammer is too soft, the particles driven off are so large as not to be sufficiently heated to fire the powder. We think the conical form of the touch-hole a real improvement; but do not approve of its widening so much as it does in the patent-breech, as the force of the fuse against the opening into the pan is greatly increased by it. Gold pans are of very little advantage; for, as the iron must be softened before they can be applied, it is very liable to rust, and thus destroy its connexion with the gold; the tin, also, by means of which the gold lining is fixed, is frequently melted by the fire of the fuse being directed upon the bottom of the pan, and the gold thereby detached from its hold: this will happen more readily when the touch-hole is placed very low, and when, from its form or width, the fire of the fuse is considerable. A great improvement, however, has lately been made in the manner of putting in the gold pans; they are now dove-tailed in before the lock-plate is hardened, by which means they seldom or never blow out; and it is now found that they will stand better than any other species of pan, provided the lock is eased from the touchhole, or taken off when the barrel is taken out of the stock. Still we are of opinion that the steel pan will be found, with common care in cleaning it, to last as long, and to answer every purpose as well, as when lined with gold.

Of the choice of gunpowder.—The excellence of this article as to its properties, and the relative condition in which it is at the time of using it, with respect to dryness, dampness, or age, are in themselves circumstances so obviously

important to the sportsman, that we have often been astonished at the almost total neglect which attends this part of the shooting science: but he may henceforward be assured, that, without the utmost circumspection and care herein, his high-priced fowling-piece will but little avail him; mortification and disgust will generally ensue, and the gunsmith too frequently be blamed for the fault which the sportsman alone has created by his own neglect. Gunpowder is composed of very light charcoal, sulphur, and well refined saltpetre. The powder used by sportsmen in shooting game is generally composed of six parts of saltpetre, one of charcoal, and one of sulphur; but these proportions, as well as the introduction of other ingredients, and the sizes of the grains, are undoubtedly varied by the different manufacturers in the composition of the powders of the same denomination, and are always kept profoundly secret. Powder, however well dried and fabricated it may have been, loses its strength when allowed to become damp. If daily observations on powder put into damp magazines, and carefully preserved in barrels, are not sufficient to establish this fact, the following experiment will render it incontestable:—Let a quantity of well-dried powder be nicely weighed, and put into a close room, where the air is temperate, and seemingly dry, and be left for three or four hours; on weighing it again, its weight will be increased. This same powder, exposed to an air loaded with vapor, acquires much additional weight in a short time. Now the increase of the weight being proportional to the quantity of vapor contained in the atmosphere, and to the length of time that the powder is exposed to it; it follows, that powder easily attracts moisture. Wherefore, if a degree of heat sufficient only to fire dry powder be applied to powder that is damp, the moisture will oppose the action of the fire, and the grains either will not take fire at all, or their inflammation will be slower; thus, as the fire will spread more slowly, fewer grains will burn; and the penetration of the fire from the surface to the centre of each grain, and consequently their consumption, will require more time. Whence it may be concluded that all degrees of moisture diminish the force of powder. Saltpetre, not sufficiently refined, attracts moisture very readily; and as the substances that render it impure lessen the quantity of fluid, and prevent its detonation, it should be refined as much as possible before it is employed in the fabrication of gunpowder. The force of powder is owing to an elastic fluid generated at the explosion, the suddenness of which depends upon the proportion of the ingredients, the contact between the nitrous and combustible particles, and the size of the grains, &c. Hence it may be concluded that when several powders, equally well dried, and fired under the same state of the atmosphere, are compared together, that which produces the greatest quantity of the elastic fluid, in a given space of time, is the strongest. There are two general methods of examining gunpowder; one with regard to the purity of its composition, the other with regard to its strength. Its purity is known by laying two or three little heaps near each other upon

white paper, and firing one of them. For if this takes fire readily, and the smoke rises upright, without leaving any dross or feculant matter behind, and without burning the paper, or firing the other heaps, it is esteemed a sign that the sulphur and nitre were well purified, that the coal was good, and that the three ingredients were thoroughly incorporated together, but, if the other heaps also take fire at the same time, it is presumed that either common salt was mixed with the nitre, or that the coal was not well ground, or the whole mass not well beat and mixed together; and, if either the nitre or sulphur be not well purified, the paper will be black or spotted. For proving the strength of gunpowder, a number of machines have been invented, all of which are liable to many objections, and, upon trial with the same powder, are found to give results so different that no dependence can be placed in them; to so many modifications are the principal properties of powder subject, even in experiments conducted with the utmost care. These variations have been attributed, by many, to the different density of the atmosphere at the time of the different experiments; but the opinions upon this matter are so improbable in themselves, and so contradictory to each other, that they claim neither attention nor belief. Thus, some will have it that gunpowder produces the greatest effect in the morning and evening, when the air is cool and dense; whilst others assert that its force is greatest in sunshine, and during the heat of the day. Mr. Robins concludes from the result of several hundred trials, made by him at all times of the day, and in every season of the year, that the density of the atmosphere has no effect in this matter, and that we ought to attribute the variations observed at these times to some other cause than the state of the air: probably they are owing to the imperfection of the instrument, or to the manner in which the trial was conducted. In this state of uncertainty, then, upon the theory of the effects of gunpowder, we remain at this day.

If experiments, however, are made with the prover, great care must be taken not to press the powder in the smallest degree into the tube, but to pour it gently in; and particularly in trying the strength of different powders, which is the best use to which the instrument, imperfect as it is, can be applied, attention must be paid that one powder is not pressed closer than another at each experiment, nor the successive experiments made until the prover is cool, otherwise no comparative certainty can be gained. By far the most certain method, however, of determining the quality of powder, is by drying some of it very well, and then trying how many sheets of paper it will drive the shot through, at the distance of ten or twelve yards. In this trial we should be careful to employ the same sized shot in each experiment, the quantity both of the shot and the powder being regulated by exact weight; otherwise we cannot, even in this experiment, arrive to any certainty in comparing the strength of different powders, or of the same powder at different times. Powder ought to be kept very dry; every degree of moisture injures it. Good powder, however, does not readily imbibe mois-

ture; and, perhaps, there is no greater proof of the bad quality of powder than its growing damp quickly when exposed to the air: this readiness to become moist depends upon the saltpetre employed in the composition not having been freed from the common salt it contains in its crude state, and which, in consequence, has a strong attraction for watery particles. Powder may acquire a small degree of dampness, and be freed from it again by drying, without much injury to its quality. But, if the moisture be considerable, the saltpetre is dissolved, and the intimate mixture of the ingredients thereby entirely destroyed. Drying powder with too great a heat also injures it; for there is a degree of heat, which, although not sufficient to fire the powder, will yet dissipate the sulphur, and impair the composition by destroying the texture of the grains. The heat of the sun is, perhaps, the greatest it can with safety be exposed to, and, if properly managed, is sufficient for the purpose: when this cannot be had, the heat of a fire, regulated to the same degree, may be employed; and for this end a heated pewter plate is perhaps as good as any thing, because pewter retains so moderate a heat that there can be little danger of spoiling the powder by producing the consequences before-mentioned.

It is observable that damp powder produces a remarkable foulness in the fowling-piece after firing, much beyond what arises from an equal quantity of dry powder; and this seems to arise from the diminution of the activity of the fire in the explosion. Unless the sportsman is very particular indeed in the mode of keeping his powder, we would recommend him always to air it and his flask, before he takes the field. Flasks made of copper or tin are much better for keeping powder in than those made of leather, or than small casks: the necks of these should be small, and well stopped with cork. After this dissertation on gunpowder, it will naturally be expected that we point out to the sportsman the best powder for shooting; for this purpose we shall recommend the Dartford powder of Messrs. Pigou and Andrews, for being not only stronger, but the cleanest in burning and the quickest in firing, of any other at this time manufactured in the kingdom; and we also venture to give it as our opinion that the manufacturers of this powder seem to have attained, as nearly as any purpose can require, that accuracy of granulation, and of the proportions and qualities of all the ingredients, which most readily produces the destruction of all the composition, and yields the greatest possible quantity of the permanent elastic fluid in a given time; which properties alone can constitute powder of the best quality.

Of shot.—The choice of this article is highly worthy of the sportsman's care. It should be equal, round, and void of cavities. The patent milled shot is, at this time, to be preferred to all other sorts, and is in such general use that the instructions which here follow on the size of the shot to be adopted in the different chases must be understood to relate to the patent shot only.

It is extremely important for the success of the chase that the sportsman should proportion the size of his shot, as well to the particular spe-

cies of game he means to pursue as to the season of killing it. Thus, in the first month of partridge shooting, shot No. 1 should be used; for since, at this time, the birds spring near at hand, and we seldom fire at more than the distance of forty paces, if the shooter takes his aim but tolerably well, it is almost impossible for a bird at this distance to escape in the circle, or disk, which the shot forms. Hares also, at this season of the year, sit closer; and, being at this time thinly covered with fur, may easily be killed with this sized shot at thirty or thirty-five paces. In snipe and quail shooting, this sized shot is peculiarly proper; for, in using a larger size, however true the sportsman may shoot, yet he will frequently miss; the objects being so small that they have great chance of escaping in the vacant spaces of the circle or disk.

About the beginning of October, at which time the partridges are stronger in the wing, No. 3 is the proper shot to be used. This size seems to be the best of any; it preserves a proper medium between shot too large and that which is too small, and will kill a hare from the distance of thirty-five to forty paces, and a partridge at fifty, provided the powder be good. It will serve also for rabbit shooting. In short, it is excellent for all seasons, and many sportsmen use no other the season round. It is true that distant objects are frequently missed for the want of larger shot; but then these bear no proportion to the number which are daily missed by using shot of too large a size, especially with the feathered game. If a man were to shoot constantly with shot No. 5, for one partridge, which he might chance to kill with a single pellet, at the distance of eighty paces, he would miss twenty birds at fifty paces which would in such case escape in the vacant spaces of the circle. But if the sportsman expressly proposes to shoot wild ducks, or hares, then, indeed, he had better use the No. 5. However, in shooting with a double barrelled gun, it may be prudent to load one of the barrels with large shot, for the necessary occasions; and, in any case where large shot is required, No. 5, will be found to be better than any other; for its size is not so large as to prevent it from sufficiently garnishing, or being equally spread in the circle, and it can at the same time perform, in effect, all that a larger sized shot can do, which garnishes but very little, if any at all.

In order, therefore, to show clearly, at one view, the comparative difference in the garnishing of shot of different sizes, we here subjoin a table, which indicates the number of pellets precisely composing an ounce weight of each sort of shot.

Patent Shot.			Common Shot.		
No.	B. B.	1 oz.	No.	7.	1 oz.
	B.	id.		6.	id.
	1.	id.		5.	id.

	8.	id.			

The Proportions of Powder and Shot in the Charge.—To find the charge that gives the longest range, in fowling pieces of different dimensions, must be allowed to be a discovery of infinite importance to every sportsman; and, as it seems to be an opinion pretty generally received and established, that every barrel has a particular load (not a measure estimated by any rules to be drawn from a comparison made between the proportions of the calibre and the length of the barrel) with which it will shoot with greater certainty and effect: it cannot be doubted that he will make some experiments with his own barrels, in order to attain this end. Before we proceed, therefore, to lay down rules for the loading of fowling pieces of different dimensions, we beg leave to engraft an excellent principle in the practice of the artillery, on this point, upon the shooting science. It is asserted that by using small charges at first, and increasing the quantity of powder by degrees, the ranges will increase to a certain point; after which, if the charge be augmented, they will progressively diminish; though the recoil will still continue in the ratio of the increase of the charge. This is a consequence that may be deduced from a variety of experiments, and is perfectly agreeable to the principles of mechanics; since the recoil and the range ought to be in the reciprocal ratio of the gun and the shot, making allowance for the resistance which these bodies meet with.

For a fowling piece of a common calibre, which is from twenty-four to thirty balls to the pound weight; a drachm and a quarter, or at most, a drachm and a half, of good powder; and an ounce, or an ounce and a quarter, of shot, is sufficient. But when shot of a larger size is used, such as No. 5, the charge of shot may be increased one-fourth, for the purpose of counterbalancing, in some degree, what the size of the shot loses in the number of pellets, and also to enable it to garnish the more. For this purpose the sportsman will find a measure marked with the proper gauges very convenient to him. An instrument of this nature may now be purchased at most of our locksmiths.

Different opinions, however, are entertained on the proportions of the charge. Some determine the charge of a fowling piece by the weight of a ball of the exact size of the calibre; estimating the weight of the powder at one-third of that of the ball, whether it is proposed to shoot with ball or with shot; and the weight of the shot they estimate at a moiety more, or, at the most, at double the weight of the ball. This calculation comes pretty near to the propositions we have just laid down, except in the difference of size between the calibres twenty-four and thirty, which, notwithstanding, is not sufficiently great in the two cases to require a gradation in the weight of the charge. Others again lay down as a rule for the charge of powder, a measure of the same diameter as the barrel: and double that diameter in depth: and, for the shot, a measure of the like diameter, but one-third less in depth than that for the powder; this also agrees tolerably well with the proportions we have mentioned, at least for the powder, but the

measure of shot seems to be too small. In shooting with a rifle-piece, some persons proportion the quantity of powder to three times the quantity which the mould of the ball adapted to the piece will contain.

Although proverbs are generally true, or at least possess some portion of truth, yet nothing is so glaringly absurd, or less founded in rational principles, than that old adage, 'Sparing of powder, and liberal of shot:' a saying which is not only in the acquaintance, but in the constant practice of most sportsmen. As a consequence of overloading with shot, the powder has not sufficient strength to throw it to its proper distance; for, if the object be distant, one-half of the pellets composing the charge, by their too great quantity and weight, will strike against each other, and fall by the way; and those which reach the mark will have small force, and will produce but little or no effect. Thus to overload is the strange fancy of poachers, who imagine they cannot kill unless they put two ounces, or more, of large shot into their pieces. It is true, that they destroy a great quantity of game, but then it is not fairly shot. Such men are in some measure punished by the severe strokes they receive on the shoulders and cheeks, in consequence of the excessive recoil.

SHOOTER'S-HILL, on the road to Dartford, in Kent, eight miles and a half from London, is supposed to have derived its name from the exercise of archery, in the neighbouring woods, in former times. On the summit of this hill are some pleasant houses, particularly the Bull Inn, which commands a most extensive prospect of Kent and the adjoining counties. This neighbourhood was formerly noted for robberies, till the road was widened, and much of the coppice-wood cut down. Within the last few years the road on the summit has been lowered many feet, leaving the Bull Inn thirty feet above the level. On the right of the road stands a triangular tower, 432 feet above the level of the sea, which was erected by the lady of Sir E. W. James, in commemoration of his conduct in the East Indies at the taking of Severndroog, from which it is named; near it stands the Admiralty telegraph.

SHOP, *n. s.* } Sax. *ƿceop*, a magazine;
SHOPBOARD, } Fr. *eschoppe*; low Lat. *shopa*.
SHOPBOOK, } Ainsworth. A place where
SHOPKEEPER, } any thing is sold, and hence
SHOP'MAN, } where certain things are manufactured: the derivatives corresponding.

Our windows are broke down,
 And we for fear compelled to shut our *shops*.

Shakspeare.

In his needy *shop* a tortoise hung,
 An alligator stuff, and other skins
 Of ill-shaped fishes; and about his shelves
 A beggarly account of empty boxes.

Id.

We have divers mechanical arts and stuffs made
 by them; and *shops* for such as are not brought into
 vulgar use.

Bacon.

That beastly rabble, that came down
 From all the garrets in the town,
 And stalls, and *shopboards*, in vast swarms,
 With new-chalked bills, and rusty arms.

Hudibras.

Scarce any sold in *shops* could be relied on as
 faithfully prepared.

Boyle.

Garth, generous as his muse, prescribes and gives;
 The *shopman* sells, and by destruction lives.

Dryden.

They that have wholly neglected the exercise of
 their understandings, will be as unfit for it, as one
 unpractised in figures to cast up a *shopbook*.

Locke.

It dwells not in *shops* or workhouses; nor till the
 late age was it ever known that any one served seven
 years to a smith or a taylor, that he should com-
 mence doctor or divine from the *shopboard* or the
 anvil; or from whistling to a team come to preach
 to a congregation.

South's Sermons.

Nothing is more common than to hear a *shop-*
keeper desiring his neighbour to have the goodness
 to tell him what is a clock.

Addison.

What a strange thing is it, that a little health, &
 the poor business of a *shop*, should keep us so sense-
 less of these great things that are coming so fast upon
 us!

Law.

SHOP-LIFTERS (from *shop* and *lifter*),
 those that steal goods privately out of shops;
 which, being to the value of 5s., though no person
 be in the shop, is felony without the benefit of
 clergy, by the 10 and 11 W. III. c. 23.

SHORE, *n. s. & v. a.* } Sax. *ƿceop*; Goth.
SHORELESS, *adj.* } *skier*. The coast of the

sea: hence both a drain, and a prop or sup-
 port: to support; hold up; and, in an obsolete
 sense, to set on shore: the adjective correspond-
 ing.

Beside the fruitful *shore* of muddy Nile,
 Upon a sunny bank outstretched lay,
 In monstrous length, a mighty crocodile.

Spenser.

They undermined the wall, and, as they wrought,
 shored it up with timber.

Knolles.

I will bring these two blind ones aboard him; if
 he think it fit to *shore* them again, let him call me
 rogue.

Shakspeare.

There was also made a *shoring* or under-propping
 act for the benevolence; to make the suns which
 any person had agreed to pay leviable by course of
 law.

Bacon's Henry VII.

He did not much strengthen his own subsistence
 in court, but stood there on his own feet, for the
 most of his allies rather leaned upon him than shored
 him up.

Wotton.

Sea covered sea;

Sea without *shore*.

Milton.

This ocean of felicity is so *shoreless* and bottom-
 less that all the saints and angels cannot exhaust it.

Boyle.

There is commonly a declivity from the *shore* to
 the middle part of the channel, and those *shory* parts
 are generally but some fathoms deep.

Burnet's Theory of the Earth.

When I use the word *shore*, I may intend thereby
 a coast of land near the sea, or a drain to carry off
 water, or a prop to support a building.

Watts's Logic.

SHORE is otherwise defined a place washed by
 the sea, or by some large river. Count Marsigli
 divides the sea shore into three portions; the
 first of which is that tract of land which the sea
 just reaches in storms and high tides, but which
 it never covers; the second is that which is
 covered in high tides and storms, but is dry at
 other times; and the third is the descent from
 this, which is always covered with water. The
 first part is only a continuation of the continent,
 and suffers no alteration from the neighbourhood
 of the sea, except that it is rendered fit for the
 growth of some plants, and wholly unfit for that

of others, by the saline streams and impregnations; and it is scarcely to be conceived by any but those who have observed it, how far on land the effects of the sea reach, so as to make the earth proper for plants which will not grow without this influence, there being several plants frequently found on high hills and dry places at three, four, and more miles from the sea, which yet would not grow unless in the neighbourhood of it, nor will ever be found elsewhere. The second portion of the shore is much more affected by the sea than the former, being frequently washed and beaten by it. Its productions are rendered salt by the water, and it is covered with sand, or with the fragments of shells in form of sand, and in some places with a tartarous matter deposited from the water; the color of this whole extent of ground is usually dusky and dull, especially where there are rocks and stones, and these covered with a slimy matter. The third part of the shore is more affected by the sea than either of the others; and is covered with a uniform crust of the true nature of the bottom of the sea, except that plants and animals have their residence in it, and the decayed parts of these alter it a little.

SHORE (Jane), the celebrated concubine of king Edward IV., was the wife of Matthew Shore, a goldsmith in Lombard-street, London. Kings are seldom unsuccessful in their amorous pursuits; therefore there was nothing wonderful in Mrs. Shore's removing from Lombard-street to slum at court as the royal favorite. Historians represent her as extremely beautiful, remarkably cheerful, and of most uncommon generosity. The king, it is said, was no less captivated with her temper than with her person; she never made use of her influence over him to the prejudice of any person; and, if ever she importuned him, it was in favor of the unfortunate. After the death of Edward, she attached herself to lord Hastings; and, when Richard III. cut off that nobleman as an obstacle to his ambitious schemes, Jane Shore was arrested as an accomplice, on the ridiculous accusation of witchcraft. This, however, terminated only in a public penance; excepting that Richard rifled her of her little property: but, whatever severity might have been exercised towards her, it appears that she was alive, though sufficiently wretched, in the reign of Henry VIII. when Sir Thomas More saw her poor, old, and shrivelled, without the least trace of her former beauty. Mr. Rowe, in his tragedy of Jane Shore, has adopted the popular story related in the old historical ballad, of her perishing by hunger in a ditch where Shoreditch now stands. But Stow assures us that street was so named before her time.

SHOREHAM, a parish in Codsheath hundred and lathe of Sutton-at-Hone, Kent, four miles north from Seven Oaks, and twenty from London, near the river Darent. Here is an antique house still called Shoreham Castle. It has a charity-school, and a fair on the 1st of May. It is a rectory, value £34 9s. 9d., united with Otford. Patrons, the dean and chapter of Westminster.

SHOREHAM, NEW, a sea-port, borough, and market-town, in Fishergate hundred, rape of

Bramber, Sussex, six miles west from Brighton, and fifty-six south by west from London, on the river Adar. The town lies about a mile within the haven, is singularly built, in the centre of which is the market-house, standing on Doric pillars. It has a considerable traffic, and has a custom-house with a collector, comptroller, and inferior officers. Along the neighbouring coast, during peace, much smuggling is carried on. The church is an extensive building, and was formerly collegiate; of late it has been repaired and greatly beautified. Although it is only a tide haven, yet, as it is the best upon the coast, vessels of considerable burden come into it, it having eighteen feet water at spring tides, but does not rise higher than twelve in common, and has only three feet at the ebb. High-water, full and change, a quarter before ten o'clock. Seven leagues west from Beachy Head. Beyond the town, across the river, is a timber bridge, leading to Arundel and Chichester. The town is a borough by prescription, and has sent members to parliament ever since 1298. It was disfranchised for corruption in 1771; but soon after restored, which circumstance produced an extension of the elective franchise to all the freeholders of 40s. within the rape of Bramber, being in number about 1300. Shoreham has a considerable trade in ship-building, and is noted for the excellence of its oysters. Ella is supposed to have landed here with his three sons, in the year 477, when he defeated the Britons, and founded the kingdom of the South Saxons. Market on Saturday. Fair, July 25th. It is a vicarage, value 6*l* 18s., in the patronage of Magdalen College, Oxford. The church is in lat. 50° 49' 39" N., long. 0° 16' 19" W.

SHORLING and MORLING, are words to distinguish fells of sheep; shorling being the fells after the fleeces are shorn off the sheep's back; and morling the fells flead off after they die or are killed. In some parts of England they understand by a shorling, a sheep whose face is shorn off; and by a morling a sheep that dies.

SHORN. The participle passive of *SHEAR*: which see: with *of*.

So rose the Danite strong,

Shorn of his strength.

Milton.

Vile shrubs are *shorn* for browse: the towering height

Of unctuous trees are torches for the night.

Dryden.

He plunging downward shot his radiant head;

Dispelled the breathing air that broke his sight;

Shorn of his beams, a man to mortal sight. *Id.*

SHORTWIND'ED,

SHORTWING'ED.

Saxon *scœper*.

Goth. and Swed.

skort; qu. Latin

curtus? Scanty;

inadequate; de-

fective; contract-

ed; not long in

space, extent,

time, or duration;

brittle; friable: a

brief account: as

an adverb, used

in composition for not long: to shorten is to

make short in any way; contract; confine; restrain: shorthand, a compendious or short method of writing: the other compounds and derivatives seem obvious in their meaning.

They changed their night into day: the light is *short*, because of darkness. *Job xvii. 12.*

Some cottons here grow, but *short* in worth unto those of Smyrna. *Sandys.*

The Turks give you a quantity rather exceeding *han short* of your expectations. *Id.*

Her breath, then *short*, seemed loth from home to pass,

Which more it moved the more it sweeter was.

Immoderate praises the foolish lover thinks *short* of his mistress, though they reach far beyond the heavens. *Id.*

The Irish dwell together by their septs, so as they may conspire what they will; whereas, if there were English placed among them, they should not be able to stir but that it should be known, and they *shortened* according to their demerits. *Spenser.*

Because they see it is not fit or possible that churches should frame thanksgivings answerable to each petition, they *shorten* somewhat the reins of their censure. *Hooker.*

The necessity of *shortness* causeth men to cut off impertinent discourses, and to comprise much matter in few words. *Id.*

Would you have been so brief with him, he would Have been so brief with you to *shorten* you,
For taking so the head, the whole head's length.

The *short* and long is, our play is preferred. *Id.*

To be known, *shortens* my laid intent;
My boon I make it, that you know me not. *Id.*

I must leave thee, love, and *shortly* too. *Id.*

Thou art no friend to God, or to the king;
Open the gates, or I'll shut thee out *shortly*.

Sir, pardon me in what I have to say,
Your p'ainness and your *shortness* please me well.

And breathe *shortwinded* accents of new broils
To be commenced in strands afar. *Id. Henry IV.*

It is better to sound a person afar off than to fall upon the point at first; except you mean to surprise him by some *short* question. *Bacon.*

They move strongest in a right line, which is caused by the *shortness* of the distance.

Whatsoever is above these proceedeth of *shortness* of memory, or of want of a stayed attention.

The English were inferior in number, and grew *short* in their provisions.

We *shortened* days to moments by love's art,
Whilst our two souls

Perceived no passing time, as if a part
Our love had been of still eternity. *Suckling.*

Repentance is, in *short*, nothing but a turning from sin to God; the casting off all our former evils, and, instead thereof, constantly practising all those christian duties which God requireth of us.

With this the Mede *shortwinded* old men eases,
And cures the lung's unsavory diseases.

The foolish and *shortsighted* die with fear
That they go nowhere, or they know not where.

In *shorthand* skilled, where little marks comprise
Whole words, a sentence in a letter lies. *Creech.*

The armies came *shortly* in view of each other.

He commanded those, who were appointed to attend him, to be ready by a *short* day. *Id.*

This less voluble earth,
By *shorter* flight to the east, had left them there.

Nor love thy life, nor hate, but what thou livest
Live well; how long or *short* permit to heaven. *Id.*

I know them not; nor therefore am I *short*
Of knowing what I ought. *Id. Paradise Regained.*

To attain
The height and depth of thy eternal ways,
All human thoughts come *short*, supreme of things.

His flesh is not firm, but *short* and tasteless.

To place her in Olympus' top a guest,
Among the' immortals, who with nectar feast;

That poor would seem that entertainment *short*
Of the true splendour of her present court. *Waller.*

We err, and come *short* of science, because we are so frequently misled by the evil conduct of our imaginations. *Glanville.*

Another account of the *shortness* of our reason, and easiness of deception, is the forwardness of our understanding's assent to slightly examined conclusions. *Id. Scepis.*

It may be easily conceived, by any that can allow for the lameness and *shortness* of translations out of languages and manners of writing differing from ours.

Short were her marriage joys: for in the prime
Of youth her lord expired before his time. *Dryden.*

He wills not death should terminate their strife,
And wounds, if wounds ensue, be *short* of life. *Id.*

He seized the helm; his fellows cheered,
Turned *short* upon the shelves, and manly steered.

As one condemned to leap a precipice,
Who sees before his eyes the depth below,
Stops *short*.

None shall dare
With *shortened* sword to stab in closer war,
But in fair combat. *Id.*

War, and luxury's more direful rage,
Thy crimes have brought, to *shorten* mortal breath,
With all the numerous family of death. *Id.*

If he meet with no reply, you may conclude that I trust to the goodness of my cause: the *short* out is, 'tis indifferent to your humble servant whatever your party says. *Id.*

From Medway's pleasing stream
To Severn's roar be thine:

In *short*, restore my love, and share my kingdom.

Beauty and youth,
And sprightly hope, and *short-enduring* joy. *Id.*

Dishonest with lopt arms the youth appears,
Spoiled of his nose, and *shortened* of his ears. *Id.*

Your follies and debauches change
With such a whirl, the poets of your age

Are tired, and cannot score them on the stage;
Unless each vice in *shorthand* they indite,

Even as nocht 'prentices whole sermons write. *Id.*

Unhappy parent of a *shortlived* son!
Why loads he this embittered life with shame? *Id.*

He celebrates the anniversary of his father's funeral,
and *shortly* after arrives at Cumæ. *Id.*

Shortwinded, unfit himself to fly,
His fear foretold foul weather. *Id.*

Ducklegged, *shortwaisted*, such a dwarf she is,
That she must rise on tip-toes for a kiss.

So soon as ever they were gotten out of the hearing
of the cock, the lion turned *short* upon him and tor him to pieces.

Id. Juvenal.

Id. Estrange.

In *short*, she makes a man of him at sixteen, and a boy all his life after. *Id.*

Other propositions were designed for snares to the *shortsighted* and credulous. *Id.*

If speculative maxims have not an actual universal assent from all mankind, practical principles come *short* of an universal reception. *Locke.*

Boys have but little use of *shorthand*, and should by no means practise it till they can write perfectly well. *Id.*

Where reason came *short*, revelation discovered on which side the truth lay. *Id.*

To *shorten* its way to knowledge, and make each perception more comprehensive, it binds them into bundles. *Id.*

Marl from Derbyshire was very fat, though it had so great a quantity of sand that it was so *short*, that, when wet, you could not work it into a ball, or make it hold together. *Mortimer.*

My breath grew *short*, my beating heart sprung upward, And leaped and bounded in my heaving bosom. *Smith.*

The *short* is, to speak all in a word, the possibility of being found in a salvable state cannot be sufficiently secured, without a possibility of always persevering in it. *Norris.*

As in many things the knowledge of philosophers was *short* of the truth, so almost in all things their practice fell *short* of their knowledge: the principles by which they walked were as much below those by which they judged as their feet were below their head. *South's Sermons.*

They, since their own *short* understandings reach No farther than the present, think even the wise, Like them, disclose the secrets of their breasts. *Rowe.*

The people fall *short* of those who border upon them in strength of understanding. *Addison.*

The frequent alterations in publick proceedings, the variety of *shortlived* favourites that prevailed in their several turns under the government of her successors, have broken us into these unhappy distinctions. *Id. Freeholder.*

Cunning is a kind of *shortsightedness*, that discovers the minutest objects which are near at hand, but is not able to discern things at a distance. *Spectator.*

May they not justly to our climes upbraid *Shortness* of night, and penury of shade? *Prior.*

As the language of the face is universal, so 'tis very comprehensive: no laconism can reach it: 'tis the *shorthand* of the mind, and crowds a great deal in a little room. *Collier.*

When I made these, an artist undertook to imitate it; but, using another way of polishing them, he fell much *short* of what I had attained to, as I afterwards understood. *Newton.*

Shortsighted men see remote objects best in old age; therefore they are accounted to have the most lasting eyes. *Id.*

Some vices promise a great deal of pleasure in the commission; but then, at best, it is but *shortlived* and transient, a sudden flash presently extinguished. *Calamy's Sermons.*

The time will *shortly* come wherein you shall more rejoice for that little you have expended for the benefit of others, than in that which by so long toil you shall have saved. *Calamy.*

It is not credible that the Phœnicians, who had established colonies in the Persian gulph, stopt *short*, without pushing their trade to the Indies. *Arbutnot.*

Whatever *shortens* the fibres, by insinuating themselves into their parts, as water in a rope, contracts. *Id.*

One strange draught prescribed by Hippocrates, for a *short-breathed* man, is half a gallon of hydromel, with a little vinegar. *Id.*

A gentleman was wounded in a duel: the rapier entered into his right side, slanting by his *shortribs* under the muscles. *Wiseman's Surgery.*

The signification of words will be allowed to fall much *short* of the knowledge of things. *Baker.*

Weak though I am of limb, and *short* of sight, Far from a lynx, and not a giant quite, I'll do what Mead and Cheselden advise, To keep these limbs, and to preserve these eyes. *Pope.*

Though *short* my stature, yet my name extends To heaven itself, and earth's remotest ends. *Id.*

Virgil exceeds Theocritus in regularity and brevity, and falls *short* of him in nothing but simplicity and propriety of style. *Id.*

Then palaces shall rise; the joyful son Shall finish what his *shortlived* sire begun. *Id.*

Even he, whose soul now melts in mournful lays, Shall *shortly* want the generous tear he pays. *Id.*

To see whole bodies of men breaking a constitution; in *short*, to be encompassed with the greatest dangers from without, to be torn by many virulent factions within, then to be secure and senseless, are the most likely symptoms in a state of sickness unto death. *Swift.*

That great wit has fallen *short* in his account. *More.*

Think upon the vanity and *shortness* of human life, and let death and eternity be often in your minds. *Law.*

SHORT (James), A. M. and F. R. S., an eminent optician, born in Edinburgh on the 10th of June, O. S. 1710. At ten years of age, having lost his father and mother, and being left in a state of indigence, he was received into Heriot's Hospital, where he soon displayed his mechanical genius in constructing for himself little chests, book-cases, and other conveniences, with such tools as fell in his way. At the age of twelve he was removed from the hospital to the High School, where he showed a considerable taste for classical literature, and generally kept at the head of his class. In 1726 he was entered into the university, where he passed through the usual course of education, and took his master's degree with great applause. By his friends he was intended for the church; but, after attending a course of theological lectures, he thought that profession little suited to his talents; and devoted his whole time to mathematical and mechanical pursuits. Having the celebrated M'Laurin for his preceptor, he soon discovered the bent of his genius, made a proper estimate of the extent of his capacity, and encouraged him to prosecute those studies in which nature had qualified him to make the greatest figure. Under the eye of that eminent master, he began, in 1732, to construct Gregorian telescopes; and, as the professor observed in a letter to Dr. Jurin, 'by taking care of the figure of his specula, he was enabled to give them larger apertures, and to carry them to greater perfection, than had ever been done before him.' See OPTICS, Index. In 1736 Mr. Short was called to London, at the desire of Queen Caroline, to give instructions in mathematics to William duke of Cumberland: and, immediately on his appointment to that very honorable office, he was elected F. R. S. and

patronised by the earls of Morton and Macclesfield. In 1739 he accompanied the former to the Orkney Isles, where he was employed in adjusting the geography of that part of Scotland. Mr. Short having returned to London, and established himself there, was in 1743 employed by lord Thomas Spencer to make for him a reflector of twelve feet focus, for which he received 600 guineas. He made several other telescopes of the same focal distance with greater improvements and higher magnifiers; and in 1752 finished one for the king of Spain, for which, with its whole apparatus, he received £1200. This was the noblest instrument of the kind that had then been constructed, and perhaps it has never yet been surpassed except by the astonishing reflectors of Herschel. See TELESCOPE. Mr. Short was wont to visit the place of his nativity once every two or three years during his residence in London, and in 1766 he visited it for the last time. On the 15th of June 1768 he died, after a short illness, at Newington Butts, near London, of a mortification in his bowels, having nearly completed his fifty-eighth year. He left a fortune of about £20,000, of which £15,000 was bequeathed to two nephews and the rest in legacies to his friends. In gratitude for the steady patronage of the earl of Morton, he left to his daughter, the Lady Mary Douglas, afterwards countess of Aboyne, £1000 and the reversion of his fortune, should his nephews die without issue; but this reversionary legacy the lady, at the desire of her father, generously relinquished by a deed in favor of Mr. Short's brother, Mr. Thomas Short, and his children. Mr. Short's eminence as an artist is universally known, and he is said to have been a man of amiable manners; but if, out of such a fortune, he left nothing to the hospital in which he received the rudiments of that education by which he acquired it, he was guilty of an omission highly criminal.

SHORTFORD, q. d. fore-close, an ancient custom in the city of Exeter, when the lord of the fee cannot be answered rent due to him out of his tenement, and no distress can be levied for the same. The lord is then to come to the tenement, and there take a stone, or some other dead thing off the tenement, and bring it before the mayor and bailiff, and thus he must do seven quarter days successively; and, if on the seventh quarter day the lord is not satisfied of his rent and arrears, then the tenement shall be adjudged to the lord to hold the same a year and a day; and forthwith proclamation is to be made in the court, that, if any man claims any title to the said tenement, he must appear within the year and day next following, and satisfy the lord of the said rent and arrears: but if no appearance be made, and the rent not paid, the lord comes again to the court, and prays that according to the custom the said tenement be adjudged to him in his demesne as of fee, which is done accordingly, so that the lord hath from thenceforth the said tenement, with the appurtenances to him and his heirs.

SHORT-HAND WRITING. See STENOGRAPHY.

SHORT-JOINTED, in the manege. A horse is said to be short-jointed that has a short pastern; when this joint or the pastern is too short, the

horse is subject to have his fore legs from the knee to the coronet all in a straight line. Commonly short-jointed horses do not manege so well as the long-jointed; but out of the manege the short-jointed are the best for travel or fatigue.

SHORT-SIGHTEDNESS, myopia, that defect in the conformation of the eye wherein the crystalline, &c., being too convex, the rays reflected from different objects are refracted too much, and made to converge too fast, so as to unite before they reach the retina, by which means vision is rendered dim and confused. See MYOPIA. A learned author thinks it probable that, out of so great a number of short-sighted persons as are daily to be met with, few are born so; for it generally grows upon young people at the age of twenty or twenty-five, and therefore might possibly be prevented by using their eyes while young to all sorts of conformations, that is, by often looking through glasses of all sorts of figures, and by reading, writing, or working with spectacles of several degrees of convexity; for, whatever be the powers by which the eye conforms itself to distinct vision, they may possibly grow weak, or lose their extent one way or other, for want of variety of exercise. It seems an opinion without foundation to think that such an exercise of the eyes can any wise injure them, provided due care be taken to avoid looking at objects that are too bright.

Dr. Smith mentions a young gentleman who became short-sighted immediately after coming out of a cold bath, in which he did not totally immerse himself, and has ever since used a concave glass for many years. It is commonly thought that short-sightedness wears off in old age, on account of the eye becoming flatter: but the learned doctor questions whether this be matter of fact or hypothesis only.

It is remarkable that short-sighted persons commonly write a small hand, and love a small print, because they can see more of it at a view. That it is customary with them not to look at the person they converse with, because they cannot well see the motion of his eyes and features, and are therefore attentive to his words only. That they see more distinctly, and somewhat farther off, by a strong light than by a weak one; because a strong light causes a contraction of the pupil, and consequently of the pencils, both here and at the retina, which lessens their mixture, and consequently the apparent confusion; and, therefore, to see more distinctly, they almost close their eye-lids, for which reason they were anciently called myopes.—Smith's Optics, vol. ii. Rem. p. 10, &c.

Jurin observes that persons who are much and long accustomed to view objects at small distances, as students in general, watch-makers, gravers, painters in miniature, &c., see better at small distances, and not so well at great distances, as the rest of mankind. The reason is, that in the eye, as well as in other parts, the muscles, by constant exercise, are enabled to contract themselves with more strength, and by disuse are brought to less strength. Hence, in the persons before-mentioned, the greater muscular ring of the uvea contracts more easily and strongly, and the cornea more re-

dily obeys the contraction of the ring, whence they see better at small distances. And the cornea, by being thus often and long bent into a greater convexity, does by degrees lose something of its elasticity, so as not to return to its natural elasticity, when the muscular ring ceases to act upon it. This is one cause of their not seeing so well at great distances: also the ligamentum ciliare, being seldom employed to lessen the convexity of the capsula, does by degrees become less capable of performing that office: and the capsula, being seldom drawn out and put into tension, must lose something of its distensible quality, so as less easily to comply with the action of the ligament. And this is another cause of their not seeing so well at great distances.—Jurin, *Essay on Dist. and Indist. Vision*. The general remedy for short-sightedness is a concave lens, held before the eye, which, making the rays diverge, or at least diminishing much of their convergency, makes amends for the too great convexity of the crystalline.

SHOT, *part. & n. s.* } The pret. and part.
SHOOTFREE, *adj.* } pass. of SHOOT, which
SHOTTEN, *adj.* } see. The act of shoot-
ing: the path or flight of a missile; the missile emitted; a gun charged; Fr. *escot*, an account: shotfree is clear of the reckoning: not to be hurt by shot: shotten is having shot or ejected the spawn.

She sat over against him, a good way off, as it were a bow shot. *Genesis xxi. 16.*

Their tongue is as an arrow shot out, it speaketh deceit. *Jeremiah.*

A shot unheard gave me a wound unseen. *Sidney.*

On the other side a pleasant grove
Was shot up high, full of the stately tree
That dedicated is to Olympick Jove.

Fairie Queene.

I shall here abide the hourly shot
Of angry eyes. *Shakspeare. Cymbeline.*

Proud death!

What feast is towered in thy infernal cell,
That thou so many princes at a shot
So bloodily hast struck? *Id. Hamlet.*

Though I could 'scape shotfree at London, I fear
the shot here: here's no scorning but upon the pate.

Id. Henry IV.

Go thy ways, old Jack; die when thou wilt, if
good manhood be not forgot upon the earth, then am
I a shotten herring. *Id.*

At this booty they were joyful, for that they were
supplied thereby with good store of powder and shot.

Hayward.

As the fund of our pleasure, let each pay his
shot;

Far hence be the sad, the lewd fop, and the sot.

Ben Jonson.

The fortifier of Pendennis made his advantage of
the commodiousness afforded by the ground, and shot
rather at a safe preserving the harbour from sudden
attempts of little fleets, than to withstand any great
navy. *Carew.*

He caused twenty shot of his greatest cannon to be
made at the king's army. *Clarendon.*

He only thought to crop the flower,
New shot up from a vernal shower. *Milton.*

From before her vanished night,
Shot through with orient beams. *Id. Paradise Lost.*

Impatient to revenge the fatal shot,

His right hand doubly to his left succeeds. *Dryden.*

Shepherd, leave decoying,
Pipes are sweet a summer's day;
But a little after toying,

Women have the shot to pay. *Id.*

Ask for what price thy venal tongue was sold!

Tough withered truffles, rosy wine, a dish
Of shotten herrings, or stale stinking fish. *Id.*

Sometimes they shot out in length, like rivers; and
sometimes they flew into remote countries in colonies.

Burnet.

The same metal is naturally shot into quite different
figures, as quite different kinds of them are of the
same figure. *Woodward.*

He, prone on ocean in a moment flung,
Stretched wide his eager arms, and shot the seas
along. *Pope.*

He touched the pence when others touched the
pot;

The hand that signed the mortgage paid the shot.

Swift.

SHOT (Fr. *boulet*, et en général toutes sortes de
charges pour les canons), a name given to all
sorts of balls used for artillery and fire-arms,
from the pistol to the cannon: those for cannon
and caronades being of iron, and those for small-
arms of lead.

Cannon shot is distinguished by the nature of
the ordnance for which it is intended; as forty-
two, thirty-two, twenty-four, eighteen, twelve,
nine-pounders, &c., and those for small-arms by
the names of the pieces; as musket, carbine,
pistol, &c.

SHOT, PATENT MILLED, is thus made: sheets
of lead, whose thickness corresponds with the
size of the shot required, are cut into small
pieces, or cubes, of the form of a die. A great
quantity of these little cubes are put into a large
hollow iron cylinder, which is mounted horizon-
tally and turned by a winch; when by their
friction against one another, and against the
sides of the cylinder, they are rendered perfectly
round, and very smooth. The other patent shot
is cast in moulds, in the same way as bullets are.

SHOT, SMALL, or that used for fowling, should
be well sized, and of a moderate bigness; for
should it be too great, then it flies thin, and
scatters too much; or if too small, then it hath
not weight and strength to penetrate far, and the
bird is apt to fly away with it. In order, there-
fore, to have it suitable to the occasion, it not
being always to be had in every place fit for the
purpose, we shall set down the true method of
making all sorts and sizes under the name of
mould shot. Its principal good properties are
to be round and solid. Take any quantity of
lead you think fit, and melt it down in an iron
vessel; and as it melts keep it stirring with an
iron ladle, skimming off all impurities whatsoever
that may arise at the top; when it begins to
look of a greenish color, strew on it as much
auripigmentum or yellow orpiment, finely pow-
dered, as will lie on a shilling, to every twelve
or fourteen pounds of lead; then, stirring them
together, the orpiment will flame. The ladle
should have a notch on one side of the brim, for
more easily pouring out the lead; the ladle
must remain in the melted lead, that its heat
may be the same with that of the lead, to pre-
vent inconveniences which otherwise might hap-
pen by its being either too hot or too cold: then,
to try your lead, drop a little of it into water,

and, if the drops prove round, then the lead is of a proper heat; if otherwise, and the shot have tails, then add more orpiment to increase the heat, till it be found sufficient. Then take a plate of copper, about the bigness of a trencher, which must be made with a hollowness in the middle, about three inches compass, within which must be bored about forty holes according to the size of the shot which you intend to cast; the hollow bottom should be thin; but the thicker the brim, the better it will retain the heat. Place this plate on a frame of iron, over a tub or vessel of water, about four inches from the water, and spread burning coals on the plate, to keep the lead melted upon it: then take some lead and pour it gently on the coals on the plate, and it will make its way through the holes into the water, and form itself into shot; do thus till all your lead be run through the holes of the plate, taking care, by keeping your coals alive, that the lead do not cool, and so stop up the holes. While your are casting in this manner, another person with another ladle may catch some of the shot, placing the ladle four or five inches underneath the plate in the water, by which means you will see if they are defective, and rectify them. Keep the lead in a just degree of heat, that it be not so cold as to stop up the holes in your plate, nor so hot as to cause the shot to crack; to remedy the heat, you must refrain working till it is of a proper coolness; and, to remedy the coolness of your lead and plate, you must blow your fire; observing that the cooler your lead is, the larger will be your shot; as the hotter it is, the smaller they will be. After casting, take them out of the water, and dry them over the fire with a gentle heat, stirring them continually that they do not melt; when dry, separate the great shot from the small, by the help of a sieve made for that purpose, according to their several sizes. But those who would have very large shot, make the lead trickle with a stick out of the ladle into the water, without the plate. If it stop on the plate, and yet the plate be not too cool, give but the plate a little knock, and it will run again; care must be had that none of your implements be greasy, oily, or the like; and when the shot, being separated, are found too large or too small for your purpose, or otherwise imperfect, they will serve again at the next operation. The sizes of common shot for fowling are from No. 1 to 6, and smaller, which is called mustard seed, or dust shot; but No. 5 is small enough for any shooting whatsoever. The No. 1 may be used for wild geese; the No. 2 for ducks, widgeons, and other water-fowl; the No. 3 for pheasants, partridges after the first month, and all the fen-fowl; the No. 4 for partridges, woodcocks, &c.; and the No. 5 for snipes and all the smaller birds.

Shot thus made is not without considerable imperfections. The exterior coat of the lower part of the drop becoming suddenly fixed by the contact of the water, its superior portion, which

is still liquid, as it also cools and contracts, necessarily pits, like the surface of metal in the channel of a mould, so that the greater part of the shot are somewhat hollow, and of an irregular form; consequently too light for the purpose to which they are destined, and liable to unequal resistance in their passage through the air. These defects are remedied in the *patent-shot*, the manufacture of which differs only from that of the preceding kind in the addition of a larger portion of arsenic, which varies according to the quality of the lead; in dropping it from such a height that it becomes solid before it enters the water, which is from forty to 100 feet; and, in some subsequent operations, which are as follows:—it is first dried and sifted. It is then boarded, which consists in scattering it on several polished slabs or trays of hard wood, with rims, in the form of a Π , except that the sides converge towards the lower part, to which a slight inclination and alternate motion in their own planes are given by boys employed in the manufacture. The shot, whose form is imperfect, are detected by the sluggishness of their motion, and remain behind, whilst the others roll off from the board. The last operation is the polishing; which is performed by agitating it with the addition of a very small quantity of black lead, not exceeding two spoonfuls to a ton, in an iron vessel, turning on an horizontal axis like a butter churn. It does not appear that any higher degree of perfection than that which is thus attained remains to be desired. The argentine brilliancy of the shot when newly made, the beautiful accuracy of its form, and the curious instance of inanimate tactics which it presents when scattered on a plate, render it even an agreeable object of contemplation.

The shot now used in the royal navy is principally confined to three sorts, namely, round, grape, and case or canister.

Round-shot (Fr. boulet rond) is the most simple, and composed of a ball or globe of cast-iron, whose weight is in proportion to the size of the cannon, or to the diameter of its bore.

Grape-shot (Fr. charge à la suédoise, ou charge en grappe) is a combination of balls, fig. 6, plate V., put into a canvas bag, and corded strongly together, so as to form a sort of cylinder, whose diameter is equal to that of the ball which is adapted to the cannon.

Case or canister-shot (Fr. charge à mitraille), fig. 7, is formed by putting a quantity of small shot into a case or canister.

The tin case is cylindrical, in diameter a little less than the calibre of the gun or howitzer. It is filled with lead balls, so as to make up the weight of the shot. These balls are seldom less than one ounce and a quarter in weight. But little effect is to be expected from firing case-shot beyond 300 yards, from the very great divergency of the balls. The proportions of shot for the royal navy are,

• Round for ships	{ Lower-deck . . .	{ 60 round each gun for Chan. Serv.
		{ 80 do. for Foreign do.
Ditto for sloops	{ Middle, upper, and quarter-deck . .	{ 70 do. for Chan. do.
		{ 100 do. for Foreign do.
		{ 50 do. for Chan. do.
		{ 60 do. for Foreign do.

Grape and case-shot are supplied each in the proportion of from five to twelve rounds for every gun, as the nature of the service may require. There are other sorts of shot formerly used, such as the chain, cross-bar, langrel, &c., but these are now nearly discontinued in the British navy.

Chain-shot (Fr. boulets enchainés), fig. 8, consists of two balls linked together, being principally designed to destroy the masts and rigging, which they are better fitted to perform than the single bullets.

Double-headed or bar-shot (Fr. boulet ramé, ou boulet à deux têtes), fig. 9, is a ball cut into two equal parts, and joined together by a bar of iron. In the French service the middle is sometimes filled with a composition, and the whole covered with linen dipped in brimstone; the cannon in firing also inflames the combustibles or composition of this ball, which sets fire to the sails of the vessel. One of the heads of this ball has a hole to receive a fuse, which communicates with the charge of the cannon.

Spherical case-shot, or Shrapnell's shell, so termed from the inventor colonel Shrapnell, of the royal artillery. See SHELL.

Star-Shot consists of four pieces of iron, whose bases, when separate, form the quadrant of a circle; so that the whole, being joined, forms a cylinder equal to the shot of the cannon. Each of those pieces is furnished with an iron bar, the extremity of which is attached to a sort of link, as keys are strung upon a ring. Being discharged from the gun, the four branches or arms extend every way from the link in the centre. These also are chiefly intended to destroy the sails or rigging, but their flight and execution are very precarious at a tolerable distance.

A Shot of a most destructive nature has been invented by a Mr. Fane, and experiments on its effects were exhibited in 1811, before the lords of the admiralty. It is a four-pounder shot, wrapped round with a prepared cotton, and made very hard, so as to appear like a large cannon-ball—on firing of which, it has the usual effect of a cannon-shot; but, the moment it starts from the cannon's mouth, it presents one solid mass of fire; and whatever it may happen to strike, whether rigging or hull of a ship, it will immediately take fire.

To find the weight of an iron shot, whose diameter is given; and the contrary. *Rule.*—Double the cube of the diameter in inches, and multiply it by 7; so will the product (rejecting the two last or right hand figures) be the weight in pounds. *Example.*—What is the weight of an iron shot of seven inches diameter? The cube of 7 is 343, which doubled is 686, and this multiplied by 7 produces 4802, which, with the

right hand figures rejected, gives 48 lbs., the weight required.

To find the diameter of the shot, when the weight is given. *Rule.*—Multiply the cube root of the weight in pounds by 1.923, and the product is the diameter in inches. *Example.*—What is the diameter of an iron shot of 52 lbs? The cube root of 52 is 3.732, which, multiplied by 1.923, gives 7.177 inches, the diameter required.

Rule, by logarithms:—

To one-third of the logarithm of 52 . . . 0.572001
Add the constant logarithm . . . 0.283979

Logarithm of the diameter . . 7.117 = 0.855980

½ . . .	— ¾ lead.	— 8½

Small shells, as four inches and two-fifths, and hand-grenades, were quilted into grape for thirteen-inch mortars, at Gibraltar. The fuses were turned inwards next the iron tompon, and leaders of quick-match for communicating fire to the fuses were introduced through holes made in the wooden bottom, and placed as near the fuse as possible, in the centre of the grape. These answered very well for short ranges.

If at any time case-shot cannot be procured, or tin for the purpose of making cases, a very good substitute may be made by the following method:—Take a wooden bottom of one-fourth of an inch less than the ordinary size, roll strong cartridge paper which has been sponged over two or three times with water, and nearly dry, on a former of the same diameter to the proper dimensions; paste down the exterior edge of the cylindrical case, and nail it on to the bottom with small tacks; when dry, pour in a quantity of hot pitch and rosin, or kitt composition; then a layer of musket-balls; continuing them alternately till the case is filled in length equal to two diameters of a round shot, independent of the wooden bottom; over the last tier put another bottom two inches in thickness, and nail it on.

TO SHOT THE GUNS (Fr. *mettre les boulets dans les canons*) is to load the pieces of ordnance with the necessary quantity of gunpowder and ball.

SHOT, TIN CASE, in artillery, is formed by putting a great quantity of small iron shot into a cylindrical tin box called a cannister, that just fits the bore of the gun. Lead bullets are sometimes used in the same manner; and it must be observed that, whatever number of sizes of the shots are used, they must weigh with their cases nearly as much as the shot of the piece.

SHOT FLAGGON, a sort of flaggon somewhat bigger than ordinary, which in some counties, particularly Derbyshire, it is the custom for the host to serve his guests in, after they have drunk above a shilling.

SHOT OF A CABLE, on ship-board, is the splicing of two cables together, that a ship may ride safe in deep waters and in great roads; for a ship will ride easier by one shot of a cable, than by three short cables out a-head.

SHOT-BOXES (Fr. *caisse à munitions*) are boxes in which grape, case, and small-arms' shot, are packed for service.

SHOTE, *n. s.* Sax. *ƿeoƿa*; Lat. *trutta minor*. A fish.

The *shote*, peculiar to Devonshire and Cornwall, in shape and colour resembleth the trout; howbeit in bigness and goodness cometh far behind him.

Carew.

SHOT-GUAGE, an instrument for measuring the diameter of shot.

SHOT-RACKS, wooden frames bolted to the coamings and head-ledges round the hatch-ways on the decks, to contain the different species of shot.

SHOVE, *v. a., v. n., & n. s.* Sax. *ƿeopan*; Belg. *schuyven*; Swed. *skufwa*. To push by main strength; drive; rush against; impel: to push before one; move by a pole in a boat: the act of shoving or pushing.

The hand could pluck her back that *shoved* her on. *Shakspeare.*

In the corrupted currents of this world,
Offence's gilded hand may *shove* by justice;
And oft the wicked prize itself
Buys out the law.

Id.

Of other care they little reckoning make,
Than how to scramble at the shearer's feast,
And *shove* away the worthy bidden guest.

Milton.

There the British Neptune stood,
Beneath them to submit the officious flood,
And with his trident *shoved* them off the sand.

Dryden.

Shoving back this earth on which I sit,
I'll mount.

Id. Tyrannick Love.

He grasped the oar,
Received his guest aboard, and *shoved* from shore.

Garth.

A strong man was going to *shove* down St. Paul's
cupola.

Arbuthnot.

He used to *shove* and elbow his fellow-servants to
get near his mistress, when money was a paying or
receiving.

Id.

Behold a reverend sire
Crawl through the streets, *shoved* on or rudely
pressed

By his own sons.

Pope.

You've played and loved, and eat and drank your
fill;

Walk sober off, before a sprightlier age

Come tittering on, and *shove* you from the stage.

Id.

Eager to express your love,
You ne'er consider whom you *shove*,
But rude press before a duke.

Swift.

The seamen towed, and I *shoved*, till we arrived
within forty yards of the shore. *Gulliver's Travels.*

I was forced to swim behind, and pushed the
boat forward with one of my hands; and, the tide
favouring me, I could feel the ground: I rested
two minutes, and then gave the boat another *shove*.

Id.

Cards were superfluous here, with all the tricks
That idleness has ever yet contrived
To fill the void of an unfurnished brain,
To palliate dulness, and give time a *shove*. *Cowper.*

SHOVEL, *n. s. & v. a.*

Sax. scof; Teut.

SHOVELBOARD, *n. s.*

schoeffel. An instru-

SHOVELLER.

ment to throw or heap

up with: to throw or heap up; to gather in great
quantities: shovelboard is a board on which
metal pieces are shoved along at a mark: a
shoveller is one who uses a shovel, also a bird.

A handbarrow, wheelbarrow, *shovel*, and spade.

Tusser.

I thought

To die upon the bed my father died,
To lie close by his honest bones; but now
Some hangman must put on my shroud, and lav me
Where no priest *shovels* in dust.

Shakspeare. Winter's Tale.

Pewets, gulls, and *shovellers*, feed upon flesh, and
yet are good meat. *Bacon.*

Ducks *shovel* them up as they swim along the
waters; but divers insects also devour them.

Denham.

The brag of the Ottoman, that he would throw
Malta into the sea, might be performed at an easier
rate than by the *shovels* of his janizaries.

Glauville's Scopsis.

So have I seen in hall of lord,

A weak arm throw on a long *shovelboard*;

He barely lays his piece.

Dryden.

This formation of the wizzon is not peculiar to
the swan, but common unto the platea, or *shovelard*,
a bird of no musical throat.

Browne's Vulgar Errors.

Shoveller, or spoon-bill: the former name the more
proper, the end of the bill being broad like a *shovel*,
but not concave like a spoon, but perfectly flat.

Grew's Museum.

SHOVEL, DRAINING, a tool employed for the
purpose of clearing out the loose crumbly earthy
materials from the bottom parts of drains. It is
formed with a crooked handle, the edges of the
shovel part being turned up on the sides, in order
to prevent the materials which are scraped
up from falling off. In consequence of the
crookedness of the handle, the workman is
prevented from stooping so much as would other-
wise be the case, in performing the work. There
are different constructions of this implement
made use of, in managing business of this sort.
A scoop is sometimes made use of, both with
and without this implement, for the purpose of
scooping up and clearing out all the crumbs,
loose mould, and other similar materials, from
the bottom parts of drains, before they are laid
or filled with spray, brush-wood, or any other
substance, in order that they may be quite clear
and free of any sort of obstruction. The tool is
formed in a crooked scoop-like manner at the
head, and of different shapes, sizes, and breadth,

according to the nature of the drains and open-
ings in which it is to be employed; being, in
working, drawn, or pushed along the bottoms of
the cuts or drains. The handle has also occa-
sionally a crooked form, in order to ease the
workman in using it.

SHOVEL, PARING, a tool employed in paring
off the sward or turf from the surface of ground,
in order to burn it. The shovel which is used
in Devonshire for this purpose has a hollow
heart-shaped form in the shovel part, with a long
handle, which makes it a very powerful imple-
ment. The plate of the mouth part is from nine
to ten inches in width, where the handle is in-
serted, which is made with a considerable curve
upwards; the blade is about twelve inches in
length, terminating with a broad angular point,
which, with its sides, are constantly kept very
sharp and keen for cutting; on the left hand, or
land side of the tool, a sharp wing, comb, or
coultter, rises up in an oblique manner, to cut
and divide the slice part from the whole ground.
This, however, in consequence of the toughness
of the surface, and the impediments presented by
the roots of furze, flags, heather, and other
similar matters, is not unfrequently dispensed
with; the slice being rent or torn off by the work-
man from the side of the whole ground, while it
is cut up and separated from the earth below.
When a foot or fifteen inches of the slice rises
upon the handle of the shovel, it is separated
from the uncut part of the surface by a sudden
effort or exertion with the tool, and by a turn of
it is whelmed or laid over the mould side up-
wards. Where the state and circumstances of
the surface will permit, as by not being too much
loaded and encumbered with the above sorts of
plants, the effort of separating the cut from the
uncut sward may in all cases be much lessened
by having the slice, which is next to be pared,
cut or nicked in such lengths as may be most
convenient to the workmen. And, in some parti-
cular places and situations of land, the regular
nicking of the slice to be pared from the ground
is indeed found indispensably necessary, as where
the ground is of such a moory quality as to render
the operation impracticable without it. In all
such instances it is, however, probably much
better, as being more convenient and expeditious,
to have the shovel formed with a cutting wing,
by which the whole may be done at once, with-
out any sort of delay in the business.

SHOVEL (Sir Cloudesly), a brave English
admiral, born about 1650, of parents rather in
the lower rank of life. He was put apprentice
to a shoemaker; but, disliking this profession, he
abandoned it and went to sea. He was at first
a cabin boy with Sir Christopher Mynns, but,
applying to the study of navigation with inde-
fatigable industry, his skill as a seaman soon
raised him. The corsairs of Tripoli having
committed great outrages on the English in the
Mediterranean, Sir John Narborough was sent in
1674 to reduce them to reason. As he had received
orders to try the effects of negotiation before he
proceeded to hostilities, he sent Mr. Shovel, then
a lieutenant in his fleet, to demand satisfaction.
The dey treated him with a great deal of disre-
spect, and sent him back without an answer. Sir

John despatched him a second time, with orders to remark particularly the situation of things on shore. The behaviour of the dey was worse than ever. Upon Mr. Shovel's return he informed Sir John that it would be possible, notwithstanding their fortifications, to burn all the ships in the harbour. The boats were accordingly manned, and the command of them given to lieutenant Shovel, who seized the guardship and burnt four others, without losing a man. This action so terrified the Tripolins that they sued for peace. Sir John Narborough gave so favorable an account of this exploit that Mr. Shovel was soon after made captain of the *Sapphire*, a fifth rate ship. In the battle of Bantry Bay, after the revolution, he commanded the *Edgar*, and, for his gallant behaviour in that action, was knighted by king William. Next year he was employed in transporting an army into Ireland; a service which he performed with so much diligence and dexterity that the king raised him to the rank of rear admiral of the blue, and delivered his commission with his own hands. Soon after he was made rear admiral of the red, and shared the glory of the victory at La Hogue. In 1694 he bombarded Dunkirk. In 1703 he commanded the grand fleet in the Mediterranean, and did every thing in his power to assist the Protestants who were in arms in the Cevennes. Soon after the battle off Malaga he was presented by prince George to queen Anne, who received him graciously, and next year employed him as commander-in-chief. In 1705 he commanded the fleet, together with the earls of Peterborough and Monmouth, which was sent into the Mediterranean; and it was owing to him chiefly that Barcelona was taken. After an unsuccessful attempt upon Toulon, he sailed for Gibraltar, and thence homeward with a part of the fleet. On the 22nd of October, at night, his ship, with three others, was cast away on the rocks of Scilly. See *SCILLY*. All on board perished. His body was found by some fishermen on the island of Scilly, who stripped it of a valuable ring and afterwards buried it. Mr. Paxton, the purser of the *Arun del*, hearing of this, found out the fellows, and obliged them to discover where they had buried the body. He carried it on board his own ship to Portsmouth, whence it was conveyed to London, and interred with great solemnity in Westminster Abbey. A monument was afterwards erected to his memory by the direction of the queen. He had married the widow of his patron, Sir John Narborough, by whom he left two daughters, co-heiresses.

SHOVELLER, in ornithology. See *ANAS*. The shoveller and spoonbill, mentioned above as synonymous by Dr. Grew, are quite different species or rather genera of birds: the shoveller is a species of *anas*: the spoonbill is the English name of the genus *platalea*. Brown is also in the same mistake.

SHOUGH, *n. s.* For shock. A species of shaggy or shock dog.

In the catalogue ye be for men,
As hounds and greyhounds, mongrels, spaniels, curs,
Shoughs, water-rugs, and demi-wolves, are cleped
All by the name of dogs. *Shakspeare. Macbeth.*

SHOULD, *v. n.* See *SHALL*.

SHOULDER, *n. s. & v. a.*

SHOULDERBLADE ,	} Sax. <i>sculderþ</i> ; Belg. <i>scholder</i> ; Dan. <i>skulder</i> . The upper joint of the arm; upper joint of the fore
SHOULDERBELT ,	
SHOULDERCLAPPER ,	
SHOULDERSHOTTEN , <i>adj.</i>	
SHOULDERSLIP .	

leg of certain animals; any prominent or rising part: the strength of any thing: the shoulderblade is the scapula: shoulderclapper, one who coaxes or one who betrays: shouldershoten is strained: shoulderslip, dislocation in the shoulder.

If I have lifted up my hand against the fatherless, when I saw my help in the gate, then let mine arm fall from my *shoulder-blade*, and mine arm be broken from the bone. *Job xxxi. 22.*

I have seen better faces in my time
Than stand on any *shoulder* that I see
Before me.

We must have *shoulder* of mutton for a property.

His horse waid in the back, and *shoulder-shotten*.
Id.

A fiend, a fury, pitiless and rough,
A back friend, a *shoulder-clapper*, one that commands
The passages of alleys. *Id. Comedy of Errors.*

Dudman, a well-known foreland to most sailors,
here *shoulders* out the ocean, to shape the same a
large bosom between itself.

Carew's Survey of Cornwall.
It is a fine thing to be carried on men's *shoulders*;
but give God thanks that thou art not forced to carry
a rich fool upon thy *shoulders*, as those poor men do.

Archimedes's, lifting up Marcellus's ships, finds little
more credit than that of the giant's *shoulder*ing moun-
tains. *Glanville.*

Emily dressed herself in rich array;
Fresh as the month, and, as the morning fair,
Adown her *shoulders* fell her length of hair. *Dryden.*

So vast the navy now at anchor rides,
That underneath it the pressed waters fail,
And, with its weight, it *shoulders* off the tides. *Id.*

When you rivet a pin into a hole, your pin must
have a *shoulder* to it thicker than the hole is wide,
that the *shoulder* slip not through the hole as well as
the shank. *Moxon.*

Around her numberless the rabble flowed,
Shouldering each other, crowding for a view.
Rowe's Jane Shore.

He took occasion from a *shoulder* of mutton to cry
up the plenty of England. *Addison's Freeholder.*

The head of the *shoulder* bone, being round, is in-
serted into so shallow a cavity in the scapula, that,
were there no other guards for it, it would be thrust
out upon every occasion. *Wiseman.*

When Hopkins dies, a thousand lights attend
The wretch who living saved a candle's end;
Shouldering God's altar a vile image stands,
Belies his features, nay, extends his hands. *Pope.*

The horse will take so much care of himself as to
come off with only a strain or a *shoulder-slip*. *Swift.*

But rude at first, and not with easy slope
Receding wide, they pressed against the ribs,
And bruised the side; and, elevated high,
Taught the raised *shoulders* to invade the ears.
Long time elapsed or e'er our rugged sires
Complained, though incommodiously pent in,
And ill at ease behind. *Cowper.*

SHOUT, *v. n. & n. s.* } A word of which no
SHOUTER, *n. s.* } etymology is known,
says Dr. Johnson. Arab. *sout*, *zaüt*; Goth.
tauta.—Thomson. To cry in triumph or exhor

tation : a vehement or loud cry of this kind ; the other noun substantive corresponding.

Shout unto God with the voice of triumph.

Psaln xlvii. 1

The *shouting* for thy summer fruits and harvest is fallen.

Isaiah.

It is not the voice of them that *shout* for mastery.

Ex. xxxii.

The Rhodians, seeing the enemy turn their backs, gave a great *shout* in derision.

Knolles's History of the Turks.

Thanks, gentle citizens :

This general applause and cheerful *shout* Argues your wisdom and your love to Richard.

Shakespeare.

They *shouted* thrice : what was the last cry for ?

Id.

He storms and *shouts* ; but flying bullets now

To execute his rage appear too slow :

They miss, or sweep but common souls away ;

For such a loss Opdam his life must pay. *Waller.*

All clad in skins of beasts, the javelin bear ;

And shrieks and *shoutings* rend the suffering air.

Dryden.

What hinders you to take the man you love ?

The people will be glad, the soldiers *shout* ;

And Bertran, though repining, will be awed. *Id.*

A peal of loud applause rang out,

And thinned the air, till even the birds fell down

Upon the *shouter's* head. *Id. Cleomenes.*

There had been nothing but howlings and *shoutings* of poor naked men, belabouring one another with snagged sticks. *More.*

SHOUT, clamor, in antiquity, was frequently used on ecclesiastical, civil, and military occasions, as a sign of approbation, and sometimes of indignation. Thus as Cicero, in an assembly of the people, was exposing the arrogance of L. Antony, who had the impudence to cause himself to be inscribed the patron of the Romans, the people, on hearing this, raised a shout to show their indignation. In the ancient military discipline shouts were used, 1. Upon occasion of the general's making a speech or harangue to the army from his tribunal. This they did in token of their approving what had been proposed. 2. Before an engagement, in order to encourage and spirit their own men, and fill the enemy with dread. This is a practice of great antiquity ; for, as mankind are endowed with two senses, hearing and seeing, by which fear is raised in the mind, it is proper to make use of the ear as well as the eye for that purpose. Shouts were also raised in the ancient theatre, when what was acted pleased the spectators. It was usual for those present at the burning of the dead to raise a great shout, and call the dead person by his name, before they set fire to the pile.

SHOW, *v. a., v. n., &* *Pret.* showed and

SHOWBREAD, [*n. s.*] shown ; *part. pass.*

SHOW'ISH, *adj.* } shown. Sax. *recean* ;

SHOW'Y. } Belg. *schowen*. This

word, frequently written *shew*, is always pronounced *show* ; which is favored by the Belg. *schowen* and Teut. *schauen*. To exhibit ; give to sight ; make to see ; prove ; explain ; inform ; publish ; discover : to appear ; look ; have appearance : a *show* is a spectacle ; mere appearance ; semblance ; likeness ; exhibition ; pomp ; phantom : for the bread see **SHUEWBREAD** : showish and showy mean, glaring ; ostentatious ; pompous.

VOL. XX.

I raised thee up to *shew* in thee my power.

Lx. ix. 16.

Set upon the table *shew-bread* before me.

Id. xxv. 30.

Thou shalt utterly destroy them ; make no covenant with them, nor *shew* mercy unto them.

Deut. vii. 2.

To him that is afflicted pity should be *shewed* from his friend.

Job vi. 14.

Wilt thou *shew* wonders to the dead ? Shall the dead arise and praise thee ? *Psaln* lxxxviii. 10.

Forasmuch as knowledge and *shewing* of hard sentences, and dissolving of doubts, were found in the same Daniel, let him be called. *Dan.* v. 12.

Felix willing to *shew* the Jews a pleasure, left Paul bound. *Acts* xxiv. 27.

Ye are a chosen generation, that ye should *shew* forth the praises of him who hath called you out of darkness. *I Peter* ii.

Shall I say O Zelmane ? Alas, your words be against it. Shall I say prince Pyrocles ? Wretch that I am, your *show* is manifest against it. *Sidney.*

The places of Ezechiel have some *show* in them, for there the Lord commanded the Levites which had committed idolatry to be put from their dignity, and serve in inferior ministries. *Whitgift.*

My lord of York, it better *showed* with you, When that your flock, assembled by the bell, Encircled you, to hear with reverence Your exposition on the holy text,

Than now to see you here, an iron man,

Cheering a rout of rebels with your drum. *Shakespeare. Henry IV.*

She *shews* a body rather than a life,

A statue than a brother.

Id. Antony and Cleopatra.

When devils will their blackest sins put on

They do suggest at first with heavenly *shours*.

Id. Othello.

As for triumphs, masks, feasts, and such *shews*, men need not be put in mind of them. *Bacon.*

Mild heaven

Disapproves that care, though wise in *show*,

That with superfluous burden loads the day.

Milton.

Nor doth his grandeur and majestic *show*

Of luxury, though called magnificence,

Allure mine eye. *Id. Paradise Regained.*

He through passed the midst unmarked,

In *show* plebeian angel militant. *Milton.*

Nothing wants, but that thy shape,

Like his, and color serpentine may *show*

Thy inward fraud, to warn all creatures from thee.

Id.

A shooting star

In autumn thwarts the night, when vapours fired

Impress the air, and *shows* the mariner

From what point of his compass to beware

Impetuous winds. *Id.*

Nor want we skill or art, from whence to raise

Magnificence, and what can heaven *shew* more ?

Id.

This I urge to *show*

Invalid that which thee to doubt it moved. *Id.*

I through the ample air in triumph high,

Shall lead hell captive, maugre hell, and *show*

The powers of darkness bound. *Id.*

Achates' diligence his duty *shows*.

Dryden.

Stand before her in a golden dream ;

Set all the pleasures of the world to *show*

And in vain joys let her loose spirits flow. *Id.*

The kindred of the slain forgive the deed,

But a short exile must for *show* precede. *Id.*

Just such she *shows* before a rising storm. *Id.*

T

What you saw was all a fairy *show*;
And all those airy shapes you now behold
Were human bodies once.

Id.

Men should not take a charge upon them that they
are not fit for, as if singing, dancing, and *showing* of
tricks, were qualifications for a governor.

L'Estrange.

I do not know what she may produce me; but,
provided it be a *show*, I shall be very well satisfied.

Addison.

The city itself makes the noblest *show* of any in
the world: the houses are most of them painted on
the outside, so that they look extremely gay and
lively.

Id.

Florio was so overwhelmed with happiness that he
could not make a reply: but expressed in dumb *show*
those sentiments of gratitude that were too big for
utterance.

Id.

Men of warm imaginations neglect solid and sub-
stantial happiness for what is *showy* and superficial.

Id.

Never was a charge maintained with such a *show*
of gravity which had a slighter foundation.

Atterbury.

The dwarf kept the gates of the *show* room.

Arbutnot.

The radiant sun
Sends from above ten thousand blessings down,
Nor is he set so high for *show* alone.

Granville.

She taking him for some cautious city patient, that
came for privacy, *shows* him into the dining-room.

Swift.

The escutcheons of the company are *showish*, and
will look magnificent.

Id.

Still on we press; and here renew the carnage,
So great that in the stream the moon *showed* purple.

Philips.

I envy none their pageantry and *show*,
I envy none the gilding of their woe.

Young.

SHOWER, *n. s. & v. a.* { Sax. *renn*; Belg.

SHOW'ERY, *adj.* { *scheure*; Goth.

shwa. Rain either moderate or violent: hence
any liberal distribution: to pour down; wet with
rain; scatter or distribute profusely: showery is
rainy; abundant in showering.

He and myself

Have travelled in the great shower of your gifts,
And sweetly felt it.

Shakspeare. Timon.

I'll set thee in a *shower* of gold, and hail
Rich pearls upon thee.

Id. Antony and Cleopatra.

If the boy have not a woman's gift,
To rain a *shower* of commanded tears,
An onion will do well for such a shift.

Shakspeare.

A hilly field where the stubble is standing, set on
fire in the *showery* season, will put forth mushrooms.

Bacon.

The ancient cinnamon was, while it grew, the
driest; and in showers it prospered worst.

Id.

After this fair discharge, all civil honours having
showered on him before, there now fell out occasion to
action.

Wotton.

Give me a storm; if it be love,
Like Danaë in the golden *shower*,
I swim in pleasure.

Carew.

Serve they as a flowery verge, to bind
The fluid skirts of that same watery cloud,
Lest it again dissolve and *shower* the earth?

Milton.

These, lulled by nightingales, embracing slept;
And on their naked limbs the flowery roof
Showered roses, which the morn repaired.

Id. Paradise Lost.

Murranus came from Anxur's *showery* height,
With ragged rocks and stony quarries white,
Seated on hills.

Addison on Italy.

Cæsar's favour,

That *showers* down greatness on his friends, will
raise me

To Rome's first honours.

Id. Cato.

With *showers* of stones he drives them far away;
The scattering dogs around at distance bay.

Pope.

His frisking was at evening hours,

For then he lost his fear,

But most before approaching *showers*,

Or when a storm drew near.

Cowper.

When no soft *shower* descends, no dew distils,
Her wave worn channels dry, and mute her rills;

When droops the sickening herb, the blossom fades,
And parched earth gapes beneath the withered glades.

Darwin.

SHOWER, in meteorology, a cloud condensed
to rain. See CLOUDS, METEOROLOGY, and RAIN.

SHOWER (John), an eminent nonconformist di-
vine, born in London in 1660, and educated
under Mr. Doolittle at Islington. In 1687 he
became pastor of a congregation in Jewin Street.
He was eminent for his piety, and published
Sacramental Sermons, and Reflections on Time
and Eternity; two works much esteemed. He
died at Hoxton in 1718, aged fifty-eight.

SHOWERS OF STONES, &c. In the ancient his-
tories of most nations marvellous anecdotes are
told, and wonderful facts seriously recorded, of
preternatural rains; such as the raining of stones,
of sand, of dust, of blood, nay even of living ani-
mals, such as fish, young frogs, &c., from the
clouds. That in the early periods of society,
when historical records were not regularly kept,
and when consequently historical facts were few
and of little importance, historians should have
been anxious to collect every thing wonderful
that tradition or credulity invented or reported,
to render their histories entertaining and agreeable
to the taste of those times, is by no means sur-
prising. Herodotus, one of the most ancient and
respectable of the Grecian historians, has filled
his history with miracles of every kind that he
could collect in all the countries through which
he travelled. Livy, one of the best of the Roman
historians, followed his example, and has inter-
larded his history, otherwise respectable, with
numerous fables and pretended miracles. In
the dark ages of modern times, when history
was chiefly entrusted to the priests and monks,
it is not surprising that the same plan should
have been continued of collecting and recording
every report, and the more wonderful, i. e. the
more incredible, the better. But that in the
present age, when scepticism is so prevalent that
not only the most important truths of revealed
religion are called in question, but mathematical
demonstration is required for almost every thing
in history and science; that at such a period,
and in such a nation as France, where infidelity
still prevails, in spite of Buonaparte's hypocrisy,
more than in any other nation in Europe, a phi-
losopher should be found pleading seriously for
the truth and possibility of such preternatural
showers, is one of those phenomena in the history
of the human mind which seems totally unac-
countable. Yet the learned Joseph Izarn, M. D.,
professor of natural philosophy, member of the
Society of Sciences, Belles Lettres, and Arts, of
Paris, &c. &c., has, within these two years, pub-
lished a work at Paris, consisting of 430 pages,

entitled *Des Pierres tombees du Ciel, &c., i.e. A Treatise on Stones fallen from the Clouds; or, Atmospheric Lithology; exhibiting the Progress and actual State of the Science; a View of the Phenomena of Thunder Stones, Showers of Stones, Stones fallen from the Heavens, &c., several unpublished Observations, with an Essay on the Theory of the Formation of the Stone.* From this extraordinary work we suppose a very few extracts will sufficiently gratify the curiosity of our readers:—I. ‘According to Paul Lucas,’ says the Dr., ‘an eye witness, a stone fell from the air at Larissa, in Macedonia, in January 1706.’ It weighed 72 lbs., resembled the dross of iron, and was seen to proceed from the north, with a loud hissing, apparently enveloped in a small cloud, from which it burst, and fell with a very loud explosion.’ II. ‘The celebrated Gassendi, whose accuracy is allowed to have equalled his knowledge, relates that, on the 27th November 1627, when the sky was very clear, he saw a burning stone, apparently four feet in diameter, fall on mount Vaiser, between the towns of Guillaumes and Perne in Provence. It was surrounded by a luminous circle of different colours, like a rainbow; and its fall was accompanied by a noise like that of many cannons fired at once. This stone weighed 59 lbs. Its weight was to that of marble as 14 to 11.’ III. ‘A shower of common and very fine sand fell in the Atlantic, at eight or nine leagues from land, on the 6th of April 1719, and continued from ten o’clock P. M. till one P. M. of the following day.’ IV. ‘In September 1753, about one P. M., the weather being very warm and serene, without any clouds, a great noise was heard like the firing of two or three cannons. Though of very short duration, it was audible at the distance of six leagues in every direction. It was loudest in the neighbourhood of Pont de Vesle. A hissing sound, like that of a squib, was likewise heard at Liponas, a village three leagues from Pont de Vesle, and four from Bourg. On the same evening there were found at Liponas, and at Pin, a village near Pont de Vesle, three leagues from Liponas, two blackish masses, of a figure nearly circular, but very unequal, which had fallen on ploughed ground, into which they had sunken half a foot by their own weight. One of them weighed about 20 lbs. They were broken, and the fragments were shown to all the curious. A similar noise was heard on St. Peter’s day, in 1750, in Lower Normandy; and a mass very nearly of the same nature, but much larger, fell at Niort. One of the stones, weighing 11½ lbs., may be seen at Dijon, in the museum of M. Varenne de Beost, principal secretary to the states of Burgundy, and correspondent of the Royal Academy of Sciences at Paris.’—M. De Lalande’s Narrative, in the Historical Almanack of Bresse, 1756. V. Messrs. Chladen, Pallas, A. G. Duluc, Patrin, and others, mention a mass of native iron that fell from the clouds in Siberia. But, as the truth of this story rests on a doubtful tradition among the Tartars, it merits no credit. VI. A more remarkable instance of the fall of stones than any which Dr. Izarn has recorded, has been related with artless simplicity by M. Marais, an inhabitant of Aigle in Normandy,

and in more scientific language by M. Biot, member of the National Institute, who was commissioned by government to investigate the fact. This gentleman observes, in his truly wonderful report, that ‘the district in which the stones were precipitated forms an elliptical extent of nearly two leagues and a half, and of about one in breadth; the greater dimension being in a direction from south-east to north-west, with a declination of about 22°, thus curiously coinciding with the magnetic meridian. The largest stone which fell weighed about 17½ lbs., and the smallest about 1000th part of that weight. The whole number of stones exceeded 2000 or 3000!’ See *Journal de Physique*; *Prairial, Année xi*, and *Journal des Debates*, 14 Thermidor, *Année xi*. Such are the principal facts related by Dr. Izarn in support of his system of atmospheric lithology. His anecdotes of showers of fire we need not quote, as no person who knows how universally the electric fluid is diffused through the atmosphere, and who has considered its powerful effects in producing storms of thunder and lightning, fire-balls, luminous meteors, &c., will doubt that it may on some occasions have assumed the form of a shower of fire. But Dr. Izarn, in his zeal for his system of atmospheric lithology, endeavours to establish and account for it, by connecting it with something like atmospherical electricity (though he elsewhere rejects all connexion with that powerful fluid), in the following conclusions:—1. That very considerable masses have sometimes fallen to the earth. 2. That these masses, penetrated by fire, roll in the atmosphere, like burning globes, which diffuse light and heat to great distances. 3. That they seem to have received a motion parallel to the horizon, though they really describe a curve. 4. That they become soft, or are fused into a paste-like consistency, as is proved by their varnished substance, and the impressions formed on their surface by the bodies which they encounter. 5. That they have fallen in England, Germany, Italy, France, and the East Indies. 6. That all these stones resemble one another in their physical characters and chemical composition.’ After having laid down some general maxims relative to natural appearances, illustrated the principal, that substances may exist in a solid, liquid, or gaseous modification, without undergoing any change of identity, and estimated the application of this recognized fact, Dr. Izarn endeavours to establish his philosophical transubstantiation by these four conclusions: 1. ‘That there must exist, in the gaseous mass which envelopes our globe, different æriform substances, which are unknown to us, which are mostly insulated by one another, and disposed in spherical masses (*massées sphériques*), by the pressure which is exercised on them in all directions. 2. That detonations take place in the atmosphere, which are not the consequence of electrical phenomena; and which perhaps have nothing in common with electricity. 3. That we ought not to ascribe every luminous matter to the combustion of hydrogen, since the phenomena present us only with a disengagement of light, which may be effected by any gaseous substance passing into another state. 4. Lastly,

that the disengagement of light does not necessarily imply that of caloric; and that the more vivid it is the less are we warranted to state it as a cause of fusion, vitrification, &c. 'Gaseous substances,' adds the Dr., 'arranged in spherical masses, in the upper regions of the air, being admitted, the various agitations of the atmosphere should naturally waft some of these masses from the medium which insulates them, into a medium capable of combining with them. If, then, the combination begins, the disengagement of light is explained. Hence this theory explains the phenomenon in its most minute details, and even when the phenomenon is incomplete!' By such dexterous management of his spherical gaseous masses, and with the help of double, treble, and nicely reduced combinations, Dr. Izarn concocts a subtle explanation of showers of sand, of winds, of stones, and of metalliferous vapors; and on the whole draws this general conclusion:—'Each of these bodies then, strictly speaking, is only a mineral abortion; a premature union of gaseous principles, combined in trouble and disorder, by perturbing circumstances; while, in the natural course of their destiny, they would proceed separately and in silence to their prototypes on the surface or in the bowels of the earth. This fact, therefore, is a mere anomaly in the grand act of mineralisation.' If any thing can exceed the absurdity of this incoherent mass of words without meaning, it is the doctor's lunatic idea of giving 'an algebraical demonstration of the possibility of stony substances being driven off from the moon into the earth's prevailing attraction!' 'Hence,' says this French physician, 'we infer that, taking for granted the existence of a propelling cause at the moon's surface, a cause adequate to the projection of bodies in every direction beyond the sphere of her attraction, a great many of these bodies would revolve in space, as satellites to our planet, while scarcely any but those which were driven off at small angles would fall on the earth's surface!!' If this ridiculous supposition of Dr. Izarn's were possible, that any particle of matter could be driven off from one planet, beyond its atmosphere, so as to fall under the prevailing attraction of another planet, then all the celestial bodies might fall into their supposed original chaos, and the proverbial tale told by the Scottish nurses to children might be realized, that 'the lift (firmament) would fall and smother the laverocks, or larks.' But see METEOROLOGY, and METEORIC STONES.

SHRED, *v. a. & n. s.* *Pret.* shred. Saxon *repeadan*. To cut into small pieces: the small pieces so made. Commonly used of cloth or herbs.

One gathered wild gourds, and *shred* them.

2 Kings.

It hath a number of short cuts or *shreddings*, which may be better called wishes than prayers. *Hooker.*

They said they were an hungry; sighed forth proverbs,

That hunger broke stone walls; that dogs must eat: And with these *shreds* they vented their complainings.

Shakspeare.

Gold, grown somewhat churlish by recovering, is made more pliant by throwing in *shreds* of tanned leather.

Bacon.

The mighty Tyrian queen, that gained
With subtle *shreds* a tract of land,
Did leave it with a castle fair
To his great ancestor. *Hudibras.*
Where did you whet your knife to night, he cries
And *shred* the leeks that in your stomach rise?

Dryden's Juvenal.

A beggar might patch up a garment with such
shreds as the world throws away. *Pope*

Shreds of wit and senseless rhimes

Blundered out a thousand times. *Swift.*

His panegyrick is made up of half a dozen *shred*,
like a schoolboy's theme, beaten general topicks. *Id.*

SHREW, *n. s.*

Belg. *schreyen*, to

SHREW, *adj.* clamor. A peevish,

SHREW'DLY, *adv.* clamorous, vexatious

SHREW'DNESS, *n. s.* woman. It appears

SHREW'ISH, *adj.* from Robert of Glou-

SHREW'ISHLY, *adv.* cester and Shakspeare

SHREW'ISHNESS, *n. s.* j that this word signified
anciently any one perverse or obstinate, of either
sex: shrewd seems originally to have been
contracted from shrewed, i. e. having the qualities
of a shrew; sly; mean; mischievous; trouble-
some: the derivatives corresponding.

There dede of hem vor hunger a thousand and mo,
and yat nolde the *screwen* to none pes go.

Robert of Gloucester.

Be merry, be merry, my wife has all;

For women are *shrews* both short and tall.

Shakspeare. Henry IV.

By this reckoning he is more *shrew* than she.

Shakspeare.

Her eldest sister is so curst and *shrewd*,

That till the father rids his hands of her,

Your love must live a maid. *Id.*

This practice hath most *shrewdly* past upon thee. *Id.*

Her garboiles, which not wanted *shrewdness* of
policy too, did you too much disquiet. *Id.*

Angelo, you must excuse us;

My wife is *shrewish*, when I keep not hours. *Id.*

He speaks very *shrewishly*; one would think his
mother's milk were scarce out of him. *Id.*

I have no gift in *shrewishness*,

I am a right maid for my cowardice;

Let her not strike me. *Id.*

At Oxford, his youth, and want of experience in
maritime service, had somewhat been *shrewdly*
touched, even before the sluices of popular liberty
were set open. *Wotton.*

It was a *shrewd* saying of the old monk, that two
kind of prisons would serve for all offenders, an in-
quisition and a bedlam: if any man should deny the
being of a God, and the immortality of the soul, such
a one should be put into the first, as being a despe-
rate heretick; but, if any man should profess to be-
lieve these things, and yet allow himself in any
known wickedness, such a one should be put into
bedlam. *Tillotson.*

Her sallow cheeks her envious mind did shew,
And every feature spoke aloud the *shrew*. *Dryden.*

This last illusion rubbed upon the sore;

Yet seemed she not to winch, though *shrewdly* pained.
Id.

A man had got a *shrew* to his wife, and there could
be no quiet in the house for her. *L'Estrange.*

No enemy is so despicable but he may do a body
a *shrewd* turn. *Id.*

When a man thinks he has a servant, he finds a
traitor that eats his bread, and is readier to do him a
mischief, and a *shrewd* turn, than an open adversary.

South.

The obstinate and schismatical are like to think

themselves *shrewdly* hurt, forsooth, by being cut off from that body which they choose not to be of. *Id.*

Corruption proceeds from employing those who have the character of *shrewd* worldly men, instead of such as have had a liberal education, and trained up in virtue. *Addison.*

Every one of them, who is a *shrew* in domestick life, is now become a scold in politicks. *Id. Freeholder.*

The neighbours round admire his *shrewdness*,
For songs of loyalty and lewdness. *Swift.*

SHREWSBURY, an ancient borough, market-town, and capital of the county of Shropshire, is 154 miles from London, 112 from Bath, and nearly equi-distant from Chester, Worcester, Birmingham, Stafford, and Hereford. Although no doubt can be entertained of the high antiquity of Shrewsbury, it being frequently mentioned by our earliest historians, there is no authentic record of its origin. Probable conjecture, however, has assigned that event to the fifth century, when the Britons were forced by the Saxons to abandon all the country to the eastward of the river Severn, and this proposition is well supported from its name, which is apparently of Saxon derivation, in which language it is called *Scrobbesbyrig*, or *Scrobbesbyri*, and in the ancient British language *Pengwern*; all signifying 'the head of the aldergroves.' Shrewsbury, from its lofty and peninsular situation, presents at every approach a pleasing variety of views; and the noble sweep of the river, which seems to embrace it, heightens at every turn the charms of the scene, except on the north and west sides, where the streets approach close to its banks, a narrow margin of meadow or of garden ground interposes between the houses and the river. The exterior circle of the town is lined with an unbroken range of well-built houses, most of which command beautiful views over the adjacent country. On its western side is a public field, called the Quarry, which occupies about twenty acres of ground, and is adorned with avenues of trees.

Shrewsbury, being esteemed the most important town and fortress on the marches of Wales, continued during several centuries to be one of the principal places of rendezvous for the English armies, and hence it was often visited by its several monarchs. Numerous conflicts took place in its immediate vicinity, and its inhabitants frequently suffered the evils incident to sieges. Shrewsbury is a corporation, both by charter and prescription. By the charter now in force, granted by king Charles I., the corporation consists of a mayor, recorder, steward, town-clerk, twenty-four aldermen, forty-eight assistants, or common council-men, two chamberlains, a sword-bearer, sergeants at mace, &c. Four general quarter sessions are held in the course of the year; and the mayor and some of the aldermen, who are magistrates, hold a court every Tuesday; and the assizes for the county are held in the months of March and August. The chartered companies, besides the general corporations, are sixteen in number, of which those of the drapers and mercers are the most considerable. This town has sent members to parliament from its earliest establishment, who are elected by

about 1200 burgesses, born and being resident in the town, and paying scot and lot. The public buildings of Shrewsbury, besides the churches and chapels, are the castle, the town-hall, the town and county gaol and bridewell, the market-house, the butter market, the theatre, the bridges, and the splendid column in honor of lord Hill. The charitable institutions are, formerly dedicated to St. Giles; another called Millington's hospital; several alms-houses; an infirmary; a dispensary for the diseases of the eye and ear, lately established in Raven Street; a house of industry; the charity schools; and various private societies for the relief of the sick and poor. A new infirmary is in progress of erection, upon a most extensive scale and praiseworthy plan; the expense of which, estimated at £20,000, will be defrayed entirely by the town and county. One of the principal ornaments of Shrewsbury is the royal free-school of Edward VI. erected in 1630, and in which upwards of 300 young gentlemen from all parts of the kingdom are here prepared for the university. The established churches are St. Chad's, in the patronage of the king; St. Mary's, the benefice in the gift of the corporation and the head master of the free-school; St. Alkmund's, in the patronage of the king; St. Julian's living is with the right hon. earl of Tankerville; Holy Cross and St. Giles's is in the patronage of lord Berwick. The most ancient religious edifice is the Abbey church, which is in the parish of Holy Cross, and is formed partly from the ruins of the old abbey. There are, besides, chapels for the various sects of dissenters; Wesleyan Methodists, Welsh Methodists, Quakers, and Roman Catholic chapels. In its manufactures the town of Shrewsbury is by no means prominent or noted. An extensive cotton manufactory was carried on from the year 1803 to 1817, by Messrs. Charles and Samuel Hulbert; the buildings have subsequently been converted into fifty dwelling houses, &c. Two very considerable thread manufactories, and the iron foundry of Mr. Hazeldine, are in a flourishing state. The extensive porter brewery of Messrs. Heathcote and Co. has been recently abandoned. The neighbourhood of Shrewsbury is highly respectable; the country beautifully picturesque, studded with gentlemen's seats, and for fertility not to be surpassed, if equalled, in England. The chief market is on Saturday, but there is another on Wednesday; and every second Wednesday in the month a fair is held, when the produce of the rich and fertile country around is disposed of. Races take place in September annually, and are well attended. The borough, town, and liberties of Shrewsbury, according to the parliamentary census of 1821, contained within the town and liberties 3538 houses, and 22,195 inhabitants.

SHRIEK, *v. n. & n. s.* Dan. *skrieger*; Ital. *scricciolare*. To cry out inarticulately with anguish or horror; to scream: a cry of this kind.

Una, hearing evermore
His rueful shrieks and groanings, often tore
Her guiltless garments, and her golden hair,
For pity of his pain. *Faerie Queen.*

On top whereof ay dwelt the ghastly owl,
Shrieking his baleful note. *Id.*
 It was the owl that *shrieked*, the fatal belman
 Which gives the sternest good night. *Shakspeare.*
 Time has been, my senses would have cooled
 To hear a night *shriek*, and my fell of hair
 Would at a dismal treatise rouse and stir
 As life were in't. *Id. Machetr.*

In a dreadful dream
 I saw my lord so near destruction,
 Then *shrieked* myself awake. *Denham.*
 Hark! peace!
 At this she *shrieked* aloud; the mournful train
 Echoed her grief. *Dryden's Knight's Tale.*
 The corps of Almon and the rest are shown;
Shrieks, clamours, murmurs, fill the frighted town.
Dryden.

SHRIFT, *n. s.* Sax. *repiſt*. Confession made to a priest. A word out of use.

Off with
 Bernardine's head: I'll give a present *shrift*,
 And will advise him for a better place. *Shakspeare.*
 The duke's commands were absolute;
Therefore, my lord, address you to your *shrift*,
 And be yourself; for you must die this instant. *Rowe.*

SHRILL, *adj. & v. n.* Swed. *skralla*. A word supposed to be made per onomatopœiam, in imitation of the thing expressed, which indeed it images very happily.—Johnson. Sounding with a piercing, tremulous, or vibratory sound: to pierce the air with such sounds.

Hark how the minstrels 'gin to *shrill* aloud
 Their merry musick that resounds from far,
 The pipe, the tabor, and the trembling crowd,
 That well agree withouten breach or jar. *Spenser.*
 Thy hounds shall make the welkin answer them,
 And fetch *shrill* echoes from the hollow earth. *Shakspeare.*
 Look up a height, the *shrill* gorged lark so far
 Cannot be seen or heard. *Id. King Lear.*
 A *shrilling* trumpet sounded from on high,
 And unto battle bade themselves address. *Shakspeare.*

Here no clarion's *shrilling* note
 The muse's green retreat can pierce;
 The grove, from noisy camps remote,
 Is only vocal with my verse.
Fenton's Ode to Lord Gower.
 The females round,
 Maids, wives, and matrons, mix a *shrilling* sound. *Pope.*

Up springs the lark, *shrill* voiced and loud. *Thomson.*

SHRIMP, *n. s.* Teut. *schrump*, a wrinkle; Belg. *scrympe*. A small crustaceous vermiculated fish.

It cannot be, this weak and writhled *shrimp*
 Should strike such terror in his enemies. *Shakspeare.*
 He hath found,
 Within the ground,
 At last, no *shrimp*,
 Whereon to imp
 His jolly club. *Ben Jonson.*
 Of shell fish there are wrinkles, *shrimps*, crabs. *Carew.*

Hawks and gulls can at a great height see mice on the earth, and *shrimps* in the waters. *Derham.*

SHRINE, *n. s.* Sax. *reſin*; Lat. *scrinium*. A case in which something sacred is repositied.

You living powers, inclosed in stately *shrine*
 Of growing trees? you rural gods, that wield
 Your scepters here, if to your ears divine
 A voice may come, which troubled soul doth yield. *Sidney.*
 Come offer at my *shrine* and I will help thee. *Shakspeare.*

They often placed
 Within his sanctuary itself their *shrines*,
 Abominations! and with cursed things
 His holy rites profaned. *Milton.*
 Falling on his knees before her *shrine*,
 He thus implored her power. *Dryden.*
 Lovers are in rapture at the name of their fair idol; they lavish out all their incense upon that *shrine*, and cannot bear the thought of admitting a blemish therein. *Watts.*

SHRINK, *v. n., v. a., & n. s.* *Preſ.* I shrunk, or shrank; *part.* shrunk. Sax. *reſincan*. To contract into less room; shrivel; be drawn together: fall back; express in this way fear of horror: to make to shrink; a contraction or corrugation of this kind.

The children of Israel eat not of the sinew which *shrank* upon the hollow of the thigh. *Gen. xxxii 32.*
 The wicked *shrank* for fear of him, and all the workers of iniquity were troubled. *1 Maccabees.*
 Leaving the two friends alone I *shrank* aside to the banqueting-house, where the pictures were. *Sidney.*
 She, weighing the decaying plight,
 And *shrunken* sinews, of her chosen knight,
 Would not awhile her forward course pursue. *Faerie Queene.*

There is no particular object so good but it may have the shew of some difficulty or unpleasant quality annexed to it, in respect whereof the will may *shrink* and decline it. *Hooker.*

I am a scribbled form, drawn with a pen
 Upon a parchment, and against this fire
 Do I *shrink* up. *Shakspeare. King John.*

Ill-weaved ambition how much art thou *shrunken*!
 When that this body did contain a spirit,
 A kingdom for it was too small a bound:
 But now two paces of the vilest earth
 Is room enough. *Shakspeare.*

I'll embrace him with a soldier's arm,
 That he shall *shrink* under my courtesy. *Id.*
 The sixth age shifts
 Into the lean and slippered pantaloen,
 His youthful hose, well saved, a world too wide
 For his *shrunken* shanks. *Id.*

I have not found that water, by mixture of ashes, will *shrink* or draw into less room. *Bacon's Natural History.*

If there were taken out of men's minds vain opinions, it would leave the minds of a number of men poor *shrunken* things, full of melancholy. *Bacon.*

Many *shrink*, which at the first would dare,
 And be the foremost men to execute. *Daniel's Civil War.*

This public death, received with such a cheer,
 As not a sigh, a look, a *shrink* bewrays
 The least felt touch of a degenerate fear. *Id.*
 If he lessens the revenue he will also *shrink* the necessity. *Taylor.*

I laugh when those who at the spear are bold
 And vent'rous, if that fail them, *shrink* and fear
 To endure exile, ignominy, bonds. *Milton.*

The noise increases;
 She comes, and feeble nature now I find
Shrinks back in danger, and forsakes my mind. *Dryden.*

The sky *shrank* upward with unusual dread,
 And trembling Tyber dived beneath his bed. *Id.*

The gold-fraught vessel, which mad tempests beat,

He sees now vainly make to his retreat ;

And, when from far the tenth wave doth appear,
Shrinks up in silent joy that he's not there. *Id.*

Fall on : behold a noble beast at bay,
And the vile huntsmen *shrink*. *Id.*

Inuring children to suffer some pain without *shrinking*, is a way to gain firmness and courage.

Locke.

Keep it from coming too long lest it should *shrink*
the corn in measure. *Martimer.*

If a man accustom himself to slight those first motions to good, or *shrinkings* of his conscience from evil, conscience will by degrees grow dull and unconcerned. *South's Sermons.*

There is in this a crack which seems a *shrink* or contraction in the body since it was first formed.

Woodward.

All fibres have a contractile power, whereby they shorten ; as appears if a fibre be cut transversely, the ends *shrink*, and make the wound gape.

Arbuthnot.

Love is a plant of the most tender kind,
That *shrinks* and shakes with every ruffling wind.

Granville.

What happier natures *shrink* at with affright,
The hard inhabitant contends is right. *Pope.*

SHRIVE, *v. a.* } Sax. *scryfan*. To hear at
SHRIVER, *n. s.* } confession : a shriver is a confessor. Not in use.

What, talking with a priest, lord chamberlain ?
Your honour hath no *shriving* work in hand.

Shakespeare.

If he had the condition of a saint, and the complexion of a devil, I had rather he should *shrive* me than wive me. *Id.*

The ghostly father now hath done his shift ;
When he was made a *shriner* 'twas for shift. *Id.*

Shrive but their title, and their monies poise,
A laird and twenty-pence pronounced with noise,
When construed but for a plain yeoman go,
And a good sober two-pence, and well so.

Cleaveland.

SHRIV'EL, *v. n. & v. a.* Belg. *schrompelen*. To contract itself into wrinkles ; to contract into wrinkles.

He burns the leaves, the scorching blast invades
The tender corn, and *shrivels* up the blades. *Dryden.*

When the fiery suns too fiercely play,
And *shrivelled* herbs on withering stems decay,
The wary ploughman on the mountain's brow,
Undams his watery stores. *Id.*

Leaves, if they *shrivel* and fold up, give them drink. *Boelyn.*

If she smelled to the freshest nosegay it would *shrivel* and wither as it had been blighted.

Arbuthnot.

SHROPSHIRE, or SALOP, an inland county of England, bounded on the north by Denbigh, a detached part of Flintshire, and by Cheshire ; on the east by Staffordshire ; on the south by Worcestershire and Herefordshire ; and on the west by Radnorshire, Montgomeryshire, and Denbighshire. It is about forty miles in length from north to south, thirty-five in breadth from east to west, 218 in circumference, and contains 1341 square miles, and 858,240 acres. Its shape is an irregular parallelogram. This county contains fifteen hundreds or divisions ; viz. Os-
westry, Pimhill, Bradford-north, Bradford-south,

and Brimstay, on the north-east side of the Severn ; the liberty of Shrewsbury, the franchises of Wenlock, and the hundred of Stoddesden, extending on both banks of that river ; the hundreds of Ford, Chirbury, Conover, Munslow, Overs, Purslow, and the honor of Clun, on the south-west side of the Severn. Shropshire is partly in the three dioceses of Hereford, Litchfield and Coventry, and St. Asaph, and is included in the Oxford circuit. There are in this county 262 churches, of which 229 are parochial. The air is, generally, very salubrious. There are mines of lead ore, of a good quality on the western side of the county, which have been productive. In some of these, tools, judged to be Roman, have been found, a few of which are preserved in the library of Shrewsbury free-school. Calamine is also met with, and the rock at Pimhill is strongly tinged with copper. Symptoms both of copper and lead appear in the Cardington hills. Coal of an excellent quality is found on the eastern side of the county, particularly in the parishes of Wellington, Lilleshall, Wrockwardine, Wombridge, Stretley, Dawley, Little-Wenlock, Madeley, Barrow, Benthall, and Broseley, which promise a great and lasting supply for the extensive iron manufactories in the neighbourhood, for domestic use, and for exportation. In this district are the following iron works :—On the south side of the Severn are Willey, Broseley, Calcot, Benthall, and Barnett's-Leason ; on the north of that river is Madeley Wood, Colebrook-dale, Lightmoor, Horsehay Old-Park, Ketley, Snedshill, Donnington, Queen's-Wood, and Wrockwardine Wood. These works employ about 6000 hands, and about 260,000 tons of coal are raised annually in this district. In the year 1802 there were on the different iron and coal works 180 fire engines ; and, thirty years preceding, there were not more than twenty.

This county is also well supplied with lime, and in general the limestone is at no great distance from coal ; it is also well supplied with building-stone. At Pitchford, near Shrewsbury, a mineral pitch is found exuding from a red sand stone ; near Jackfield, south of the Severn, is carried on a manufacture of coal tar ; and in the hundred of North-Bradford, are found several salt springs. The river Severn runs through the county, from north-west to south-east, and is navigable the whole way, neither lock nor weir being upon it from Poolquay, in Montgomeryshire, to the mouth of the Avon near Bristol, a distance of 155 miles. The other rivers are the Camlet, the Teme, the Clunn, the Vyrnwy, the Perry, the Weaver, the Cund-brook, and several smaller streams. Here are several lakes or meres, each covering from forty to 116 acres of ground. The turnpike roads are kept in tolerable repair, but the private roads are generally bad, particularly in the clayey part of the county : and accommodation by canal navigation in Shropshire is very considerable by means of the Shropshire, the Shrewsbury, the Ketley, the Ellesmere, and other canals. The Shropshire canal may be called a system of water levels and inclined planes ; its general direction is from north to south, and it commences in the Severn at

Coalport. It was completed in the year 1792, and is said to have cost only £45,000. The Shrewsbury canal commences in that town, and terminates in the Shropshire canal; it was completed and opened in 1797. The Ellesmere canal is, rather than one, a system of canals, distributed over that extensive and fertile district of country which lies between the banks of the Severn and the Mersey, and between the skirts of North Wales and the borders of Staffordshire; this canal unites the rivers Severn, Mersey, and Dee, and opens a communication by water to the ports of Liverpool and Bristol. There are seventeen market-towns in Shropshire, and nine towns or villages which have fairs but not markets. Various branches of the linen, flannel, and woollen manufactures are carried on near Shrewsbury; and at Coalport and Caughley are manufactures of China ware of great excellence, the blue and white, and the blue, white, and gold China made there is in many instances equal to that from the east. Shropshire, though not remarkable for its agriculture, is in general well cultivated. Its chief products are wheat, coal, iron, limestone, lead, &c., and its manufactures are flannel, broad-cloth, Welsh cottons, mineral tar, cast-iron, &c. This county sends twelve members to parliament, two for the shire; and the boroughs of Shrewsbury, Ludlow, Bridgenorth, Wenlock, and Bishop's Castle, two each. In history, this county has been conspicuous for its military events from the time of the Roman invasion; and during the civil war of Charles I. it was distinguished for its loyalty.

SHROUD, *n. s., v. a., & v. n.* Sax. *reþrod*. A shelter; a cover; winding sheet; the sails and sail-ropes of a ship: the verb active and verb neuter corresponding.

I turned back to the mast of the ship; there I found my sword among some of the *shrouds*. *Sidney.*

By me invested with a veil of clouds,
And swaddled, as new-born, in sable *shrouds*,
For these a receptacle I designed. *Sandys.*

That same evening, when all *shrouded* were
In careless sleep, all without care or fear,
They fell upon the flock. *Spenser.*

He got himself to Mege, in hope to *shroud* himself
until such time as the rage of the people was appeased. *Knolles.*

The tackle of my heart is crackt and burnt;
And all the *shrouds* wherewith my life should sail
Are turned to one little hair. *Shakspeare.*

It would warm his spirits,
To hear from me you had left Antony,
And put yourself under his *shroud* the universal
landlord. *Id. Antony and Cleopatra.*

Now the wasted brands do glow;
Whilst the screech-owl, screeching loud,
Puts the wretch that lies in woe
In remembrance of a *shroud*. *Shakspeare.*

One of these trees, with all his young ones, may
shroud four hundred horsemen. *Raleigh.*

Whoever comes to *shroud* me, do not harm
That subtle wreath of hair about mine arm. *Donne.*

Besides the faults men commit, with this immediate
avowed aspect upon their religion, there are
others which slyly *shroud* themselves under the skirt
of its mantle. *Decay of Piety.*

A weather-beaten vessel holds
Gladly the port, tho' *shrouds* and tackle torn. *Milton.*

The winds

Blow moist and keen, shattering the graceful locks
Of these fair spreading trees; which bids us seek
Some better *shroud*, some better warmth, to cherish
Our limbs benumbed. *Id. Paradise Lost.*

If your stray attendants be yet lodged
Or *shroud* within these limits, I shall know
Ere morrow wake. *Milton.*

So Venus from prevailing Greeks did *shroud*
The hope of Rome, and saved him in a cloud. *Waller.*

The flaming *shrouds* so dreadful did appear,
All judged a wreck could no proportion bear. *Dryden.*

Moon, slip behind some cloud: some tempest rise,
And blow out all the stars that light the skies,
To *shroud* my shame. *Id.*

The **SHROUDS** are a range of large ropes extending from the mast-heads to the right and left side of the ship, to support the masts and enable them to carry sail, &c. The shrouds as well as the sails are denominated from the masts to which they belong. Thus they are called the main, fore, and mizen shrouds; the main-top-mast, fore-top-mast, or mizen-top-mast shrouds; and the main-top-gallant, fore-top-gallant, or mizen-top-gallant shrouds. The number of shrouds by which a mast is sustained, as well as the size of rope of which they are formed, is always in proportion to the size of the mast and the weight of the sail it is intended to carry. Bow-sprit shrouds are those which support the bowsprit. Bumkin shrouds are those which support the bumkins. Puttock shrouds are shrouds which connect the efforts of the top-mast shrouds to the lower shrouds. Bentick shrouds are additional shrouds to support the masts in heavy gales. Preventer shrouds are similar to bentick shrouds, and are used in bad weather to ease the lower rigging. See **MAST** and **SAIL**.

SHROVETIDE, *n. s.* } From shrove, the
SHROVE-TUESDAY. } preterite of shrive.
The time of confession; the day before Ash
Wednesday or Lent.

At *shrovetide* to shroving. *Tusser.*

SHROVE-TUESDAY is the Tuesday after Quinquagesima Sunday, and is so called from the Saxon shrive, i. e. to confess. On this day all the people in every parish throughout England, while popery prevailed, were obliged to confess their sins, one by one, to their own parish priests, in their own parish churches; and, that this might be done the more regularly, the great bell in every parish was rung at ten o'clock; and, though the Romish religion is now abolished, the custom of ringing the great bell in several ancient parish churches of England, still remains, and obtains in London the name of pancake-bell; perhaps because, after the confession, it was customary for the confessed to dine on pancakes. Most churches, indeed, have dropt the custom of ringing the bell on Shrove-Tuesday; but the dining on pancakes still continues.

SHRUB, *n. s.* } Sax. *reþbbe*. A bush; a
SHRUBBY, *adj.* } small tree; abounding in
shrubs.

He came unto a gloomy glade,
Covered with boughs and *shrubs* from heaven's light. *Faerie Queen*

The humble *shrub* and bush with frizzled hair.

Milton.

Gentle villager,

What readiest way would bring me to that place?

—Due west it rises from this *shrubby* point. *Id.*

Comedy is a representation of common life, in low subjects; and is a kind of juniper, a *shrub* belonging to the species of cedar. *Dryden.*

Trees generally shoot up in one great stem or body, and then at a good distance from the earth spread into branches; thus gooseberries and currants are *shrubs*, oaks and cherries are trees. *Locke.*

Plants appearing withered, *shrubby*, and curled, are the effects of immoderate wet.

Mortimer's Husbandry.

I've lived

Amidst these woods, gleaning from thorns and *shrubs*

A wretched sustenance.

Addison.

On that cloud-piercing hill

Plinlimmon, the goats their *shrubby* brows

Gnaw pendent.

Philips.

All might have been as well brushwood and *shrubs*.

More.

SHRUB (frutex), is a low dwarf tree, or a woody vegetable, of a size less than a tree; and which, instead of one single stem, frequently from the same root puts forth several sets of stems. See PLANT and TREE. Such are privet, phillyrea, holly, box, honey-suckle, &c. Shrubs and trees put forth in autumn a kind of buttons, or gems, in the axis of the leaves; these buttons are as so many little ova, which, coming to expand by the warmth of the following spring, open into leaves and flowers. By this, together with the height, some distinguish shrubs from suffrutices, or under shrubs, which are low bushes, that do not put forth any of these buttons, as sage, thyme, &c. The two hardiest shrubs we have in this country are the ivy and box; these stand the severity of our hardest winters unhurt, while other shrubs perish, and trees have their solid bodies split and torn to pieces. In the hard winter of 1683 these two shrubs suffered no injury any where; though the yews and hollies, which are generally supposed very hardy, were that winter in some places killed, and in others stripped of their leaves, and damaged in their bark. Furze-bushes were found to be somewhat harder than these, but they sometimes perished, at least down to the root. The broom seemed to occupy the next step of hardness beyond these. This lived where the others died, and where even this died the juniper shrubs were sometimes found unhurt. This last is the only shrub that approaches to the hardness of the box and ivy, but even does not quite come up to them; for, while they suffer nothing in whatever manner they are exposed, the juniper, though it bears cold well under the shelter of other trees, yet cannot bear the vicissitudes of heat and cold; insomuch that some juniper shrubs were found half dead and half vigorous; that side which faced the mid-day sun having perished by the successive thawings and freezings of its sap; while that which was not exposed to the vicissitudes of heat, had borne the cold perfectly well. Such shrubs as are not hardy enough to defy the winter, but appear half dead in the spring, may often be recovered by Mr. Evelyn's method of beating their branches with a slender hazel wand, to strike off the with-

ered leaves and buds, and give a free passage to the air, to the internal parts. Where this fails, the method is to cut them down to the quick, and, if no part of the trunk appears in a growing condition, they must be taken off down to the level of the ground.—Philos. Trans. No. 165.

SHUCKFORD (Samuel), a learned English divine, who was curate of Shelton in Norfolk, prebendary of Canterbury, and chaplain in ordinary to the king. His manners were those of a philosopher, uncorrupted by the manners of the world. He wrote a History of the World, sacred and profane, to serve as the introduction to Prideaux, in 3 vols. 8vo. It is heavily written, but displays a great deal of erudition. His death, in 1756, prevented him from carrying it down to the year 747 B. C., where Prideaux begins. He wrote also a treatise on the Creation and Fall of Man, to serve as a supplement to the preface to his history.

SHRUG, *v. n. & v. a.* Belg. *schricken*, to tremble. To express horror or dissatisfaction by motion of the shoulders or whole body; to contract; draw up.

Like a fearful deer that looks most about when he comes to the best feed, with a *shrugging* kind of tremor through all her principal parts, she gave these words. *Sidney.*

The touch of the cold water made a pretty kind of *shrugging* come over her body, like the twinkling of the fairest among the fixed stars. *Id.*

Be quick, thou wert best

To answer other business; *shruggest* thou malice?

Shakspeare.

He grins, smacks, *shrugs*, and such an itch endures,

As 'prentices or school-boys, which do know

Of some gay sport abroad, yet dare not go. *Donne.*

And yet they ramble not to learn the mode

How to be drest, or how to lisp abroad,

To return knowing in the Spanish *shrug*.

Cleveland.

He *shrugged* his sturdy back,

As if he felt his shoulders ake.

Hudibras.

He *shrugs* his shoulders when you talk of securities.

Addison.

They grin, they *shrug*,

They bow, they snail, they scratch, they hug.

Swift.

SHUDDER, *v. a.* Belg. *schuddren*. To quake with fear or aversion.

All the other passions fleet to air,

As doubtful thoughts, and rash embraced despair,

And *shuddering* fear.

Shakspeare.

The fright was general; but the female band

With horror *shuddering* on a heap they run.

Dryden.

I love—alas! I *shudder* at the name,

My blood runs backward, and my faltering tongue Sticks at the sound.

Smith.

Cæsar will shrink to hear the words thou utterest,

And *shudder* in the midst of all his cohorts.

Addison.

SHUFFLE, *v. a., v. n., & n. s.* Sax. *ryfelung*, a bustle, tumult. To throw into disorder; to agitate or throw together tumultuously: to play mean tricks; taking off and up: a shuffle is a trick; artifice; the act of disordering: *shufflingly*, with disordered gait.

In that sleep of death, what dreams may come, When we have *shuffled* off this mortal coil,

Must give us pause.

Shakspeare.

I myself, leaving the fear of heaven on my left hand, and hiding mine honour in my necessity, am fain to *shuffle*. *Id.*

Your life, good master,
Must *shuffle* for itself. *Id.*

Mincing poetry,
'Tis like the forced gait of a *shuffling* nag. *Id.*
The motions of *shuffling* of cards, or casting of dice are very light. *Bacon.*

They sent forth their precepts to convert them before a court of commission, and there used to *shuffle* up a summary proceeding by examination, without trial by jury. *Id.*

When the heavens *shuffle* all in one,
The torrid with the frozen zone,
Then sybil, thou and I will greet. *Cleveland.*

He *shuffled* up a peace with the cedar, in which the Bumelians were excluded. *Howel.*

I have nought to do with that *shuffling* sect, that doubt eternally and question all things. *Glanville.*

From a new *shuffling* and disposition of the component particles of a body, might not nature compose a body dissoluble in water? *Boyle.*

A glimpse of moonshine sheathed with red,
A *shuffled*, sullen, and uncertain light,
That dances through the clouds and shuts again. *Dryden.*

I may go *shufflingly*, for I was never before walked in trammels; yet I shall drudge and moil at constancy, till I have worn off the itching in my pace. *Id.*

If any thing hits we take it to ourselves; if it miscarries, we *shuffle* it off to our neighbours. *L'Estrange.*

A sharper both *shuffles* and cuts. *Id.*

The crab advised his companion to give over *shuffling* and doubling, and practice good faith. *Id.*

The gifts of nature are beyond all shams and *shuffles*. *Id.*

We shall in vain, *shuffling* the little money we have from one another's hands, endeavour to prevent our wants; decay of trade will quickly waste all the remainder. *Locke.*

If, when a child is questioned for any thing, he persist to *shuffle* it off with a falsehood, he must be chastised. *Id.*

To these arguments concerning the novelty of the earth, there are some *shuffling* excuses made. *Burnet.*

In most things good and evil lie *shuffled*, and thrust up together in a confused heap: and it is study which must draw them forth and range them. *Smith.*

If a steward be suffered to run on without bringing him to a reckoning, such a sottish forbearance will teach him to *shuffle*, and strongly tempt him to be a cheat. *Id.*

We sure in vain the cards condemn,
Ourselves both cut and *shuffled* them. *Prior.*

'Tis not strange that such a one should believe that things were blindly *shuffled* and hurled about in the world; that the elements were at constant strife with each other. *Woodward.*

Shuffled and entangled in their race,
They clasp each other. *Blackmore.*

He has *shuffled* the two ends of the sentence together, and, by taking out the middle, makes it speak just as he would have it. *Atterbury.*

Though he durst not directly break his appointment, he made many a *shuffling* excuse. *Arbutnot.*

Cards we play
A round or two; when used, we throw away,
Take a fresh pack; nor is it worth our grieving
Who cuts or *shuffles* with our dirty leaving. *Granville.*

Is it not a firmer foundation for contentment to believe that all things were at first created, and are continually disposed for the best, than that the whole universe is mere bungling, nothing effected for any purpose, but all ill-favoured cobbled and jumbled together, by the unguided agitation and rude *shuffles* of nature. *Bentley.*

SHUN, *v. a.* } Sax. arcunian. To avoid;
SHUN'LESS, *adj.* } decline; endeavour to escape: shunless is unavoidable.

Consider death in itself, and nature teacheth Christ to *shun* it. *Hooker.*

Alone he entered
The mortal gate of the city, which he painted
With *shunless* destiny. *Shakspeare.*

The lark still *shuns* on lofty boughs to build,
Her humble nest lies silent in the field. *Waller.*

Birds and beasts can fly their foe:
So chanticleer, who never saw a fox,
Yet *shunned* him as a sailor *shuns* the rocks. *Dryden.*

Cato will train thee up to great
And virtuous deeds; do but observe him well,
Thou'lt *shun* misfortunes, or thou'lt learn to bear them. *Addison.*

SHUNAMITE, a native of Shunem.

SHUNEM, a city of Israel, belonging to the tribe of Issachar, five miles south of Tabor. Josh. xix. 18. A lady of rank in this city was extremely hospitable to the prophet Elisha; in recompense for which, being previously barren, she got a son, who was afterwards restored to life by the prophet. 2 Kings, iv. 8—37.

SHUR, in ancient geography, a city of Arabia on the north-east side of the Red Sea, which gave name to the adjacent desert, where the angel appeared to Hagar, the mother of Ishmael. Gen. xvi. 7; Exod. xv. 22. It appears to have been seated on the west border of the Amalekites (1 Sam. xv. 7; and xxviii. 8); and is supposed to be the Surratte of Ptolemy.

SHUS, a mass of ruins in the province of Khuisistan, in Persia, extending for the space of about twelve miles from the Keralh to the Alzal. Like the ruins of Ctasephon, Babylon, and Cufa, they consist of hillocks of earth and rubbish, covered with broken pieces of brick and colored tile. The two largest and most remarkable of these mounds stand at the distance of about two miles from the Keralh. The first, at the lowest computation, is a mile in circumference, and nearly 100 feet high; the other, though not quite so high, has double the circumference. These mounds bear some resemblance to the pyramids of Babylon, with this difference that, instead of being formed of brick, they consist of clay and pieces of tile, with irregular layers of brick and mortar, five or six feet thick, intended, it should seem, as a kind of prop to the mass. The Arabs, in digging for hidden treasure, often discover here large blocks of marble, covered with hieroglyphics. Major Rennell and Mr. Kinnear seem to fix this site as that of the ancient capital of Susa, instead of Shuster.

SHUSHIAN, or Susa, in ancient geography, a city of Persia, capital of the province of Susiana, or Khuisistan. It had a palace, the residence of several of the Persian kings. When it was taken by Alexander the Great he found in it 50,000 talents of gold, besides jewels and plate to an

immense value. It has been long in ruins, and is now called Valdak, or, as others say, Tuster. See *SUSA*.

SHUSTER, a principal district and city of the province of Khusistan, in Persia. It forms the fairest portion of the ancient Susiana, being watered by four fine rivers, and a number of smaller streams. The oppression of the governor, however, joined to the depredations of the tribes who occupy the fortresses of the neighbouring mountains, have reduced it almost to a desert.

SHUSTER, the capital of the province of Khusistan, at the foot of a range of mountains, and on an eminence overlooking the rapid course of the Karoon, is defended on the western side by the river, and on the other sides by an old stone wall. The houses are good, and principally built of stone. The population exceeds 15,000; and there is a considerable manufactory of woolen stuffs. This city has been generally believed to be the ancient Susa. It contains ruins which testify it to have been a place of vast extent, and considerable magnificence. The most remarkable are the castle, built on a small hill at the eastern extremity of the town; the dyke erected by Sapor across the Karoon, with the view of directing the waters into a channel more advantageous to agriculture; and the bridge, of hewn stone, and consisting of thirty-two arches, twenty-eight of which are still entire. Long. 48° 59' E., lat. 32° 0' N.

SHUT, *v. a., v. n., n. s., adj.*, } *Pret.* I shut; *SHUTTER*, *n. s.* } *[& part. } part. pass. shut.*
Sax. pertran: Belg. *schutten*. To close; confine; prohibit; bar; exclude (taking out); and often taking up; to be closed: as a noun substantive the act of shutting; a small door: as an adjective, rid; clear: a shutter is a door or cover.

They went in, male and female of all flesh; and the Lord shut him in. *Genesis.*

To a strong tower fled all the men and women, and shut it to them, and gat them up to the top. *Judges.*

Thou hast known my soul in adversities; and not shut me up into the hand of the enemy. *Psalms.*

Kings shall shut their mouths at him. *Isaiah.*

Woe unto you, scribes! for you shut up the kingdom of heaven against men. *Matthew.*

Before faith came, we were kept under the law, shut up unto the faith which should afterwards be revealed. *Galatians.*

Beat in the reed,

The juster you drive it to shut out the rain. *Tusser.*

Although he was patiently heard as he delivered his embassy, yet, in the shutting up of all, he received no more but an insolent answer. *Knolles.*

In such a night

To shut me out! pour on, I will endure. *Shakspeare.*

The king's a-bed;

He is shut up in measureless content. *Id.*

Dangerous rocks shut up the passage. *Raleigh.*

We see more exquisitely with one eye shut than with both open; for that the spirits visual unite more, and become stronger. *Bacon.*

The wind-gun is charged by the forcible compression of air; the imprisoned air serving, by the help of little falls or shuts within, to stop the vents by which it was admitted. *Wilkins.*

She opened, but to shut

Excell'd her power; the gates wide open stood. *Milton.*

Shall that be shut to man which to the beast Is open? *Id.*

Wisdom at one entrance quite shut out. *Id.*

On various seas not only lost,

But shut from every shore, and barred from every coast. *Dryden.*

He, in his walls confined,
Shut out the woes which he too well divined. *Id.*

To leave you blest, I would be more accurst
Than death can make me; for death ends our woes,
And the kind grave shuts up the mournful scene. *Id.*

What barbarous customs!

Shut up a desert shore to drowning men,
And drive us to the cruel seas agen. *Id.*

The wealthy,

In lofty litters borne, can read and write,
Or sleep at ease, the shutters make it night. *Id.*

We must not pray in one breath to find a thief,
and in the next to get shut of him. *L'Estrange.*

Sometimes the mind fixes itself with so much earnestness on the contemplation of some objects, that it shuts out all other thoughts. *Locke.*

There were no shuts or stopples made for the animal's ears, that any loud noise might awaken it. *Ray.*

His mother shut up half the rooms in the house, in which her husband or son had died. *Addison.*

When the scene of life is shut up, the slave will be above his master, if he has acted better. *Collier.*

In a very dark chamber, at a round hole, about one-third part of an inch broad, made in the shut of a window, I placed a glass prism. *Newton.*

Lucullus, with a great fleet, shut up Mithridates in Pitany. *Arbutnot.*

SHUTER (Edward), an English actor of some fame. His father was a chairman, and Edward was employed as a marker at a billiard table; but discovering some genius for the stage he was engaged at Covent Garden theatre; where he became a performer of some consequence in low comedy. He died in 1776.

SHUTTLE, *n. s.* } *Isl. skutul*; *Goth. skut*

SHUT'TLECOCK. } *tul*, i. e. shot tool. A weaver's tool for throwing the weft: shuttlecock or cork, one thrown backwards and forwards in a manner similar to the shuttle.

Like shuttles through the loom, so swiftly glide

My father's hours. *Sandys.*

With dice, with cards, with billiards far unfit,

With shuttlecocks misseeming manly wit. *Hubbard's Tale.*

I know life is a shuttle. *Shakspeare.*

The **SHUTTLE**, in the manufactures, is an instrument used by the weavers, which guides the thread it contains, either of woollen, silk, flax, or other matter, so as to make it form the woofs of stuffs, cloths, linens, ribands, &c., by throwing the shuttle alternately from left to right, and from right to left, across between the threads of the warp, which are stretched out lengthwise on the loom. In the middle of the shuttle is a kind of cavity, called the eye or chamber of the shuttle, wherein is enclosed the spool, which is a part of the thread destined for the woof; and this is wound on a little tube of paper, rush, or other matter.

The riband weaver's shuttle is very different from that of most other weavers, though it serves for the same purpose; it is of box, six or seven inches long, one broad and as much deep, shod

with iron at both ends, which terminate in points, and are a little crooked, the one towards the right and the other towards the left, representing the figure of an *∞* horizontally placed. See *WEAVING*.

SHY, *adj.* Swed. & Dan. *sky*; Ital. *schifo*. Reserved; not familiar; not free of behaviour; suspicious.

A *shy* fellow was the duke; and, I believe, I know the cause of his withdrawing.

Shakespeare. Measure for Measure.

Princes are, by wisdom of state, somewhat *shy* of their successors; and there may be supposed in queens regnant a little proportion of tenderness that way more than in kings.

Wotton.

We grant, although he had much wit, He was very *shy* of using it, As being loath to wear it out, And therefore bore it not about.

Hudibras.

We are not *shy* of assent to celestial informations, because they were hid from ages.

Glanville.

I am very *shy* of employing corrosive liquors in the preparation of medicines.

Boyle.

She is represented in such a *shy* retiring posture, and covers her bosom with one of her hands.

Addison's Guardian.

The bruise imposthumated, and turned to a stinking ulcer, which made every body *shy* to come near her.

Arbutnot.

What makes you so *shy*, my good friend?

There's nobody loves you better than I.

Id.

But when we come to seize the inviting prey,

Like a *shy* ghost it vanishes away.

Norris.

The horses of the army, having been daily led before me, were no longer *shy*, but would come up to my very feet without starting.

Swift.

I know you *shy* to be obliged,

And still more loth to be obliged by me.

Southern.

SIAM, or **SYAMA**, **BLACK**, a kingdom of India beyond the Ganges, situated principally between lat. 10° and 15° N. To the north its boundaries are unknown; on the south it has the sea and the Malay peninsula; on the east are the countries now comprehended in the Cochin-Chinese empire; and the west the dominions of the Birmanians. Before its extent was so much contracted, by the victories of the latter nation, its length was estimated at 360 miles by 300 the average breadth; but these must have been the extreme dimensions, and liable to annual fluctuation. The proper seat of the Thai, or Siamese race, is along the banks of the great river Menam; but their sovereignty and language have, in prosperous periods, had a much wider range.

Siam may be described as a vast plain intersected by the Menam, on the banks of which all the principal towns are situated, and separated from the Birman and Cochin-Chinese empires by two long ridges of mountains. In addition to this it possesses a great extent of sea-coast along the Gulf of Siam, which is, however, but thinly inhabited, the Siamese having an aversion to settle on the margin of the sea, probably through dread of the Malay pirates. Like the provinces of Bengal it is subject to annual inundations, which begin in July, and when at their height overflow the country, except the artificial sites of the villages and the trees. The stalks of rice rise with the flood, and keep on the surface until it subsides. Near the shores of the Menam, the only part of the country to which Europeans

have recently had access, the land is flat and the soil alluvial, on which account, after the rainy season is over, many extensive morasses remain, and render the climate extremely pestilential to European constitutions, causing fluxes, dysenteries, and acute fevers. In the more elevated tracts, remote from the river, the country is parched and dried up. To the overflowing of the river the land in its vicinity owes its fertility, and is very productive of rice and other plants that require a redundant supply of moisture. Wheat is also raised on the higher grounds, but in very small quantities; the Europeans formerly settled here, having been obliged to import what they required for their own use. Besides these the soil is capable of raising all the richest of the productions for which Bengal is celebrated; but little comparatively is cultivated, owing to the miserable government by which the peasantry are oppressed and harassed. Here are many medicinal plants and gums; also oil of jessamine, benzoin, lack, crystal, emery, antimony, cotton, wood, oil, wax, lac, varnish, wild cinnamon, cassia buds, and iron wood, the last of which is much used by the natives, Malays, and Chinese, as anchors for their vessels. Betel nut is produced and exported in considerable quantities by the Portuguese ships and Chinese junks. Most of the fruits of Hindostan thrive in Siam, and there are in addition the dorian and mangoes.

The domesticated quadrupeds are horses, cows, buffaloes, sheep, goats, and elephants; and, in the jungles, tigers, rhinoceroses, deer, and hares, are found. There is great abundance of common poultry; besides which there are peacocks, pigeons, partridges, stipes, parrots, and other birds. The cows give but little milk, which is mostly supplied by the female buffaloes, but the natives have not the art of converting it into butter. The horses are of a very inferior race, the best being imported from Batavia. The insects and vermin are the same as in other parts of India, and the sea and rivers yield excellent fish, upon which a great proportion of the lower classes subsist. In addition to these there are fine lobsters, turtle of a good quality, oysters, and the mango fish, so much esteemed in Calcutta. The mountains in the interior yield diamonds but little inferior to those of Hindostan, sapphires, rubies, and agates. Among the mountains and rivulets gold is also collected, and probably in considerable quantities, as much is used in Siam for the gilding of idols, temples, and other public edifices, and there is none known to be imported by sea. In the interior, iron, tin, lead, and, copper, are procured—the latter of a good quality, but scarce.

The Siamese have never been in the habit of carrying on foreign commerce in their own vessels, the tonnage being principally supplied by the Portuguese, Chinese, and Cochin-Chinese, comparatively little intercourse subsisting with Hindostan. The Menam, by which ships enter, discharges itself into the Gulf of Siam; but has a bar at its mouth, to cross which the assistance of a pilot is required. The southerly monsoon is the best season for ships to visit Siam, and the northerly for returning to Hindostan through the

Straits of Malacca. Bancok, or Bancasay, situated on the river near the bay, is the principal place of trade, and the king is the chief merchant. No private merchant here dares to trade in tin, tutenague, elephants' teeth, lead, or sapan wood, without permission from his majesty, who monopolises these articles, and receives them from his subjects in lieu of revenue. The excellent sauce, named ballachong, is best procured here, where it is composed of dried shrimps, pepper, salt, and sea-weed, beaten together to the consistence of a tough paste, and then packed in jars for sale. Vessels bound for Siam, by taking out a fresh port clearance at Malacca, escape a number of charges. Unlike the Malays, although so near them, the Siamese have the utmost aversion to quit their own homes, and have consequently made no maritime excursions, and planted no colonies.

The constitution of the Siam government is despotic, and there are no hereditary nobility. All the inhabitants are liable to be called on for military services, and very few standing troops are maintained. Their arms are matchlocks, always in a bad condition, spears, and creeses. They make their own gunpowder, but it is of so very inferior quality that considerable quantities are imported. Their fortifications are stockades of trees and posts encircled by a ditch, but the real defence of Siam consists in the natural obstacles presented to invaders by the jungles, morasses, and numerous branches of rivers; to which may be added the unhealthiness of the climate, which soon thins the ranks of an army. As in the Malay states, the heir apparent to the throne possesses a legitimate authority almost equal to that of the reigning monarch. A small part of the taxes are levied in money, but much the greater part of the revenue is received in kind, and realized by sale to foreign traders. In 1750 the population was computed, by the French missionaries, at 1,900,000, but apparently without any proper foundation for the estimate.

The Siamese nation, properly so called, consists of two races, the Thay, and the Thay Jhay. Of these the latter are the most ancient, and were formerly famous for their learning and the power of their empire, of which many monuments are said still to exist. The Thay Jhay inhabit the country between the Menam and the Mekan, or river of Cambodia; but the Thay, for the most part, inhabit on the west of the Menam or Siam River, or between that and the frontiers of the Tinnaw (Tennasserim), Mon (Pegu), and Barma (Birman) nations. By the Birmans they are denominated Syan, whence the Portuguese seem to have borrowed their Siam and Siaoim, and from whom the other European nations have adopted the term. The former capital of Siam was named Yudia, or Yoodra; from which circumstance the Siamese are frequently, by the Birmans, called Yoodras. In their manners and customs they greatly resemble the Birmans and Peguers. The females here are obliged to drudge in all the laborious employments; by them the woods are cleared, the earth cultivated, and the harvest reaped. Both males and females take as much pains to blacken their teeth as the Europeans do to preserve them white. The men

eradicate their beards, but allow their nails to lengthen like the Chinese. They are extremely gross feeders, in which they resemble the other nations east of the Ganges. Among their edibles are rats, lizards, grasshoppers, and other insects, disgusting to the natives of Hindostan. Their houses are raised on posts, and are ascended to by a ladder on the outside. Like all the semi-barbarous nations in this quarter of the globe, their artists in gold are remarkably expert, and their fillagree work singularly beautiful. They excel also in beating out gold leaf, of which a great deal is expended in adorning their temples and idols. The Chinese practitioners, who are their chief physicians, have long been accustomed to the use of the bath in fevers and other distempers, and if they are not successful in the cure they receive no pay. The Siamese generally are so addicted to singing, on all occasions, that the missionaries found the best way of imprinting their precepts on the memories of this people was to form them into short Latin songs adapted to popular tunes. They have a variety of musical instruments, but all disagreeable to a European ear; of the European instruments they prefer the organ, on account of the loudness of its melody, and were much attracted by it to the Roman Catholic churches. Time is still measured by vessels having a small hole perforated and placed in a tub of water, the construction of clocks being beyond their mechanical powers.

The Thay language is that which is used by the Siamese, who in their own tongue assume this name as their national appellation. It appears to be in a great measure original, and is purely monosyllabic, and more powerfully accented than any of the other Indo-Chinese languages. The Siamese contains a great variety of compositions; their poems and songs are very numerous, as are their Cheritras, or historical and mythological fables. Many of the Siamese princes have been celebrated for their poetic powers, and several of their historical and moral compositions are still preserved. The Siamese Cheritras, or romantic fictions, are very numerous; and the personages introduced, with the exception of Rama, and the heroes of the Ramayana, have seldom much similarity to those of the Brahmins. On the eastern coast of the peninsula the Siamese language extends as far south as Patani, where it meets the Malay dialect. Besides the natives there are many colonies of foreigners established in Siam, particularly Chinese, Portuguese, Malays, Macassars, and Buggesses. At an early period the English, Dutch, and French, had also settlements, but none of them continued permanent. The commerce of the country is, at present, almost entirely conducted by the Chinese and native Portuguese; the latter of whom have now scarcely any thing of the European but the name.

The national religion of Siam is that of Buddha, or Sammonacodom, and entirely resembles that of the Birmans described under the article Ava, but all sects are tolerated. The doctrines of the Siamese faith are singularly severe, and admit of no indulgencies whatever; but the bulk of the nation are persuaded that rigid virtue and perfection are not prescribed to them but only to

their priests; and trust to their mortifications and austerities as expiations for the faults of the whole. As among the Hindoos, suicide is regarded favorably, but is by no means so generally practised. The first French missionaries reached Siam in A. D. 1662, after a most painful and arduous journey over land to the Bay of Bengal, where they embarked; but prior to this the Christian religion had made some progress so early as 1621, through the medium of the Portuguese. The French mission was subsequently prosecuted with great zeal for more than a century, and was occasionally assisted by political emergencies, but no essential progress was ever made towards effecting the benevolent intentions of the missionaries.

The Siamese histories of the Thay dynasty are said to detail, with much minuteness and great exaggeration, the events that have occurred in Siam, and the adjacent states and countries, during the last 1000 years, and also the events of 400 years prior to that period, from the building of the city Maha Nakkon, but with less precision. The records of the other dynasty, the Thay Jhay, are supposed still to exist. Notwithstanding these documents, the Siamese nation was wholly unknown in Europe, until the discovery of the route to India by the Cape of Good Hope. The first traces of their authentic history begin about A. D. 1550, and were acquired through the medium of the Portuguese, who frequently acted as auxiliaries to the factions contending for the government. From the records of the East India Company it appears that, in 1684, they sustained considerable losses by a Mr. Constantine Falcon (a Cephalonian Greek) one of their inferior servants, who ran away in their debt, and obtained possession of their property, by making presents to the king of Siam, whose prime minister he afterwards became. In 1684 ambassadors were sent from Siam to Louis XIV. on board of an English vessel; and, in consequence, Messrs. Ceberet and La Loubere were despatched as ambassadors to Siam, where they arrived the 27th of September, 1787, and immediately solicited the king to embrace the Roman Catholic religion. In this request they were the more urgent from learning that an envoy had arrived from the court of Persia to convert him to the Mahometan faith. The Siamese monarch declined the conversion proposed, but entered into a strict alliance with the French, whom he allowed to garrison Bancok and Mergui, the two most important havens in his dominions. This intimacy was, however, of short duration; as in 1688, by a sudden revolution, the king was dethroned and murdered, Falcon executed, and the French expelled. From this period Siam experienced much internal discord, and many sanguinary massacres; but remained exempt from external annoyance until 1754, when, in consequence of the conquest of Pegu, the Birman dominions came in contact with those of Siam. War immediately ensued, and has continued, with the exception of a few short intervals, ever since; and, greatly to the detriment of the Siamese, who were repeatedly defeated with great slaughter, had their capital sacked in 1766, and lost all their maritime possessions on

the Bay of Bengal, and along the west coast of the Malay peninsula. But although, by the chance of war, the Siamese have been subjected to many vicissitudes, and brought frequently to the brink of destruction, they have never ceased to exist as a distinct and independent nation, for which they are probably indebted to the domestic dissensions of the Birmans, and the natural strength of their country.

SIAM, a city in the kingdom of Siam, of which it is the capital, (lat. $14^{\circ} 5' N.$ long. $100^{\circ} 25' E.$) situated on an island formed by the Menam, or Siam River, intersected by several canals, and has several other islands adjacent. Although of great extent it is now very thinly populated. The palace of the king is a large irregular confused building, covering a great space of ground, and surrounded by high walls, which include also several temples. In this town there are many casts of statues and cannon, the latter of a prodigious calibre, which indicate a greater perfection in the arts at some former era than is now found among the Siamese. In 1766 this place was captured by the Birmans after a long blockade. By the Birmans the town of Siam is frequently named Dwarawuddly, but by the natives it is called See-y-thaa. Most places of consequence are here distinguished by two appellations, one in the vulgar tongue, and the other in the Pali or learned language.

STAMPA (Champa), a province in the Cochinchinese empire, situated principally between lat. 10° and $11^{\circ} N.$ To the north its boundaries are undefined; on the south it has the sea of China; on the east Cochinchina and the sea; and on the west Cambodia. It is a small mountainous territory, separated into three divisions.

SIANG-YANG, a city of China, of the second rank, in the province of Quang-si, 1045 miles S. S. W. of Peking. Long. $111^{\circ} 39' E.$ lat. $32^{\circ} 5' N.$

SIBBALD (Sir Robert), M. D., a celebrated and learned Scottish physician, writer, and antiquarian, born in Fifeshire in 1643. He was educated at the university of St. Andrew's, where he took his degrees, and afterwards travelled into France and Italy. On his return to Scotland he projected the plan for establishing the Royal College of Physicians. He likewise planned and commenced the Botanical Garden at Edinburgh, which has since been so highly improved. His medical practice was very extensive; yet he spent much time on the study of Scottish antiquities. He wrote *The Natural History of Scotland*, and *The History of Fifeshire*. He died in 1750.

SIBBALDIA, in botany, a genus of the pentagynia order, and pentandria class of plants; natural order thirty-fifth, santicosæ: CAL. divided into ten segments; the petals are five, and are inserted into the calyx: STYLES attached to the side of the germens: SEEDS five. There are three species:—1. *S. altaica*; 2. *S. erecta*; and, 3. *S. procumbens*, the reclining sibbaldia, is a native of North Britain, having never been discovered in the southern parts of the island. It grows on Ben-Lomond and Ben-Mor, within a mile of the summit. It is distinguished by a procumbent or trailing stem; by three leaves growing on the

top of a small foot-stalk, which are trifid at the extremity, and somewhat hairy. The flowers are yellow, and blossom in July or August.

SIBBENS, or SIVVENS, in medicine, an infectious disease of a chronic nature, somewhat resembling syphilis, prevalent in the western parts of Scotland. It is said to be so denominated from the appearance of a fungous extuberance from some of the cutaneous sores, not unlike a raspberry; the word sibben, or sivven, being the Highland appellation for a wild raspberry. Whence it has also been sometimes confounded with the yaws, a disease of tropical climates, brought from Africa, and so denominated by the negroes from the same fruit. The disease is commonly communicated by the direct conveyance of the infectious matter by some species of contact, and generally through the medium of the mouth. The extensive propagation of the disease in Scotland seems ascribable to the uncleanly practices which prevailed among the lower classes of the people, such as using the same utensils in eating and drinking, passing the same pipe from mouth to mouth, sleeping in the same bed, using the same towel, &c.; the most effectual check, therefore, to the progress of it, was to be expected from a system of prevention, which consisted in adopting a more decent and cleanly proceeding. Dr. Gilchrist recommended the persons employed in harvest-work each to carry with him a dish, cup, knife, spoon, and a cloth to wipe them with, that all the party might not eat with the same utensils, and transfer contagion. He also strongly urged the impropriety of admitting that common familiarity which every one claims by custom to kiss and fondle children, and especially to deny it to strangers, and those of low rank. By attending to these and similar means of prevention the disease appears to have been materially controlled.

SIBERIA, sometimes denominated Asiatic Russia, is that part of the immense territory of the Russian empire which lies to the east of the Ural chain, by which the empire is intersected from north to south. It has already received our attention under the article RUSSIA, which see. It may be described, distinctly, as a flat tract of land of considerable extent, declining imperceptibly towards the Frozen Ocean, and by equally gentle gradations rising towards the south; where at last it forms a great chain, constituting the boundary of Russia on the side of China. The greatest breadth from the cape of Cevero Vostochnoi, called in some maps Taimara, to the Altaian mountains south of the sea of Baikal, may be estimated at 28°, or 1680 geographical miles. In British miles the length, at a gross computation, may be stated at 5350, and the breadth at 1960, which extent exceeds that of Europe. The vast country of Siberia, says Mr. Tooke, contains, by calculation, upwards of 10,500,000 of square versts, comprehending within it several kingdoms, taken by roving Kozaks (Cossacks) on their own account, and then surrendered to the czar, who completed the conquest.

One of the chief sources of Russian wealth has long been the mineral treasures of Siberia. These were first explored by order of Peter the Great, and have since been worked with much

advantage. The eastern side of the Uralian mountain is the chief mining district in the Asiatic part of the empire; and the metals obtained in that region are mostly gold, copper, and iron. Valuable gold mines are worked at Catherinburg in lat. 57°, and those of Berezoff, in the same vicinity, are esteemed the richest in the Russian dominions. Metallic veins extend in various directions from this centre, and there are numerous iron and copper foundries in the same neighbourhood. The silver mines of Kolyvan, in the Altaian range, are near the place where the Oby enters the southern confines of Siberia, and were first opened in 1745. They have proved very advantageous. The mines at Nertschink, in the Daourian range, were discovered in 1704, but they are less productive. The Altai range contains mines of lead and copper, with which gold and silver are sometimes mixed. But the most valuable of the Russian mines are those of iron, which are principally in the eastern branches of the Ural mountains. The inferior metals are less plentiful. Antimony is obtained in the mines of Nertschink, and zinc is found both there and in the Altaian chain, where nickel, cobalt, and bismuth, have been obtained in small quantities. Quicksilver has also been discovered in the eastern part of Siberia. Coal is scarcely known; but salt, sulphur, alum, nitre, vitriol, and natron, abound. A variety of gems and precious stones likewise exist in the mountains. The topaz is found in the Daourian hills, and the beryl is met with both there and near Catherinburg. Red garnets are numerous near the sea of Baikal; and others of a pale yellow have also been obtained in the same region. The onyx, agate, jasper, and lapis lazuli, are also found in the distant mountains of Siberia; while many parts of the Uralian chain afford fine marble, and others supply granite and porphyry. An ample field for mineralogical research, however, is still open in this portion of the globe.

The mineral waters of Siberia have been little explored. The principal that are known are the warm baths near the Caucasian mountains, particularly at Terek, and at Tiflis, the capital of Georgia, with those in the vicinity of the sea of Baikal, and some others in the most eastern part of the same mountains. There is also a fetid sulphureous spring at Sarepta, a few versts from Astracan, and others in Siberia. Kamtschatka likewise contains several mineral springs. Those near the southern extremity are of a very hot and penetrating quality, and emit clouds of smoke. Chalybeate springs are found among the iron mines in the vicinity of Catherinburg.

The whole of northern Asia was first known by the name of Sibir, or Siberia; but the appellation is gradually passing into disuse. When the Monguls established a kingdom in these regions, the first residence of the princes was on the river Tura, on the site of the town now called Trumen, about 180 miles south-west of Tobolsk; but they afterwards removed to the eastern shore of the Irtysh, and there founded the city of Isker near Tobolsk. This new residence was also called Sibir, of unknown etymology, and the name of the city passed to the Mongul principality. Although this is doubted by Coxe,

Pallas says that the ruins of Sibir are still visible twenty-three versts from Tobolsk, and that it gave name to the rivulet Sibirka, and the whole of Siberia. When the Russians began the conquest of the country they were unapprised of its extent; and the name of this western province was gradually diffused over the half of Asia. The principality established by the Monguls under Sheibani in 1242 in the western part of Siberia, around Tobolsk and the river Tura, from which it has sometimes been called Tura, has been already mentioned. The actual conquest of Siberia commenced in the reign of Ivan Vassillievitch II., who ascended the Russian throne in 1534. Induced by the prospect of establishing a traffic for Siberian furs, he determined to undertake the conquest of the country, and in 1558 added to his titles that of lord of Sibir, or Siberia. Yarmak, a Cossack chief, being driven by the Russian conquests in the south to take refuge, with 6000 or 7000 of his followers, near the river Kama, afterwards marched down the Ural chain, defeated the Tartar Kutchun, khan of Sibir, and pressed forwards to the Tobol and the Irtysh, and also to the Oby, and, in this astonishing expedition, subjugated Tartars, Vogules, and Ostiaks. Finding it impossible to maintain and complete his conquests with his small army, he surrendered them in 1581, by a formal capitulation, to the czar Ivan Vassillievitch, who nobly rewarded his magnanimity and exertions. This conqueror of Siberia, however, did not live to witness the full accomplishment of this enterprise. He died in 1584; and after his death the discovery and conquests which he had made were prosecuted by regiments of Donskoi Cossacks, sent thither for that purpose, as far as the Eastern Ocean and the mountains of China; and in the middle of the seventeenth century this whole part of the world had become a Russian province. A person, whose name was Cyprian, was appointed first archbishop of Sibir in 1621, and at Tobolsk, where he resided, he drew up a narrative of the conquest. About the middle of the seventeenth century the Russians had extended east as far as the river Amur; but Kamtschatka was not finally reduced till the year 1711. Behring and other navigators afterwards proceeded to discover the other extreme parts of Asia. In his first voyage in 1728 Behring coasted the eastern shore of Siberia as high as lat. $67^{\circ} 18'$, but his important discoveries were made during his voyage of 1741. The Aleutian Isles were visited in 1745; and in the reign of the empress Catharine II. other important discoveries followed, which were completed by captain Cook. In the south the Mongul kingdom of Kazan was subdued in 1552, and that of Astrakhan in 1554, and the Russian monarchy extended to the Caspian Sea. In 1727, after previous conflicts, the Russian limits were continued westward from the source of the Argoon to the mountain Sabyntaban, near the conflux of two rivers with the Yenisei; the boundary being thus ascertained between the Russians and the Monguls subject to China. The trade with China has been conducted at Zuruchaitu, on the river Argoon, lat. 50° N., long. 337° E., and at Kiachta, about ninety miles south of the sea of Baikal, lat. 51° N., long. 106°

E. This boundary between two states is the most extensive on the globe, reaching from about 65° to 145° of long., or 80° (lat. 50°); yielding, by the allowance of thirty-nine geographical miles to 1° , 3120 miles. See RUSSIA.

SIBILATION, *n. s.* Lat. *sibilo*. A hissing sound.

Metals, quenched in water, give a *sibilation* or hissing sound. *Bacon's Natural History.*

A pipe, a little moistened on the inside, maketh a more solemn sound than if the pipe were dry; but yet with a sweet degree of *sibilation* or purling. *Id.*

SIBIR, an ancient city of Asia, and the capital of Siberia, to which it gave name. It was seated on the right bank of the Irtysh, about eighteen versts from Tobolsk, and was the residence of the ancient sovereigns of Siberia. The ruins of a rampart are all that remain of this ancient seat of Siberian monarchs.

SIBIRIA, the ancient name of Siberia, from Sibir, its capital; still used by authors who write in Latin respecting that country or its products; as *Ovis Sibiricus*, &c., Pallas.

SIBRECHTS (John), an eminent Flemish painter, born at Antwerp, in 1625. He came over to London, where he was much employed by the nobility. He excelled in painting land scapes with cattle. He died in 1703.

SIBTHORP (John), a late celebrated botanist, was the youngest son of Dr. Humphrey Sibthorp, professor of botany at Oxford, where the subject of this article was born, October 28th, 1758. He received the first rudiments of his education at Magdalen school, whence he was removed to that of Lincoln. In due time he entered Lincoln College, Oxford; but upon obtaining the Radcliffe travelling fellowship, became a member of University College. Being intended for the medical profession, he was sent to Edinburgh; but he took the degree of doctor of physic in his own university. The taste he had early imbibed for natural history, especially botany, was indulged in a tour to the Highlands of Scotland: after his return from which he visited France and Switzerland, spending a considerable time at Montpellier, where he formed an intimacy with Broussonet, collected many plants of that country, and communicated to the Academie des Sciences of Montpellier, of which he became a member, an account of his numerous botanical discoveries. The death of an elder brother of his father, by which a considerable estate devolved on the latter, occasioned Dr. J. Sibthorp to return to England in 1783, when, on his father's resignation, he was appointed to the botanical professorship.

Dr. Sibthorp, having passed a portion of the year 1784 at Gottingen, projected there his first tour to Greece; the botanical investigation of which celebrated country, and especially the determination of the plants mentioned by its classical authors, had, for some time past, become his leading object. He first visited the principal seats of learning in Germany, and cultivated the friendship of the two professors Jacquin, father and son; studied with peculiar care the celebrated manuscript of Dioscorides, which has so long been preserved in the imperial libra-

ry of Vienna; and procured a most excellent draughtsman, Mr. Ferdinand Bauer, to be the companion of his expedition. On the 6th of March, 1786, they set out together from Vienna, and passed through Carniola to Trieste, Venice, Bologna, Florence, Rome, and Naples, keeping an exact record of their botanical observations. After viewing the celebrated environs of Naples, they sailed thence early in May, and touching at Messina, as well as at the Isle of Milo, proceeded to Crete. Having narrowly escaped shipwreck, in returning to Milo by one of the country vessels, Dr. Sibthorp and his companion touched successively at several islands of the Archipelago, visited Athens, and remained for a while at Smyrna: they traced the steps of Sheppard and Hasselquist, proceeded by land to Bursa, climbed the Bithynian Olympus, and at length reached Constantinople, where they spent the ensuing winter, in the course of which Dr. Sibthorp devoted himself to the study of modern Greek. In a botanical excursion to Belgrad, on the 17th of February 1787, and another to Bujuckderi, March 5th, the plants found in flower were almost entirely the same as are met with, at the same season, in England. Dr. Sibthorp's residence at Constantinople, or in the neighbouring Isle of Karkı, proved very favorable to his investigations of the fishes and birds of those regions.

Having on the 14th of March, 1787, joined company with captain Emery and Mr. Hawkins, Dr. Sibthorp sailed from Constantinople in a Venetian merchant ship for Cyprus, taking the islands of Mytilene, Scio, Cos, and Rhodes, and touching at the coast of Asia Minor, in their way. A stay of five weeks at Cyprus enabled Dr. Sibthorp to draw up a Fauna and Flora of that island. The former consists of eighteen mammalia, eighty-five birds, nineteen amphibia, and 100 fishes; the latter comprehends 616 species of plants. The particular stations, domestic and medical uses, and reputed qualities of these last, are amply recorded; and the vernacular names of the animals, as well as of the economical plants, are subjoined. The same method is pursued, in a subsequent part of this journal, respecting the plants and animals of Greece, with every thing that could be collected relative to the medicine, agriculture, and domestic economy of that country and the circumjacent isles. The illustration of the writings of Dioscorides, in particular, was Dr. Sibthorp's chief object. The names and reputed virtues of several plants, recorded by that ancient writer, and still traditionally retained by the Athenian shepherds, served occasionally to elucidate, or to confirm their synonymy. The first sketch of the Flora Græca comprises about 850 plants. 'This,' says the author, 'may be considered as containing only the plants observed by me in the environs of Athens, on the snowy heights of the Grecian Alp Parnassus, on the steep precipices of Delphi, the empurpled mountain of Hymettus, the Pentele, the lower hills about the Piræus, the olive grounds about Athens, and the fertile plains of Bœotia. The future botanist, who shall examine this country with more leisure, and at a more favorable season of the year, before the

summer sun has scorched up the spring plants, may make a considerable addition to this list. My intention was to have travelled by land through Greece: but the disturbed state of this country, the eve of a Russian war, the rebellion of its bashaws, and the plague at Larissa, rendered my project impracticable.' Of the mammalia of Greece, thirty-seven are enumerated, with their modern names, twenty-five reptiles, and eighty-two birds. All these catalogues were greatly augmented by subsequent observations, inasmuch that the number of species, collected from an investigation of all Dr. Sibthorp's manuscripts and specimens for the materials of the *Prodromus Floræ Græcæ*, amounts to about 3000.

We cannot particularly trace our traveller's steps through Greece, or the various islands of the Archipelago. His health, which suffered from the confinement of a ship, and the heat of the weather, was restored at Athens, where he arrived on the 19th of June, 1787. Thence he prosecuted his journeys in various directions, and with various successes: the ascent of Mount Delphi, or Delphi, in Negropont, in a storm of wind and rain, on the 3d of August, was one of his most laborious, if not perilous adventures; but his botanical harvest was abundant. With regard to scenery, Mount Athos, which he visited a week after, seems to have made most impression on his mind. This spot also greatly enriched his collection of rare plants. Hence he proceeded to Thessalonica, Corinth, and Patras, at which last place he embarked with Mr. Bauer, on board an English vessel, for Bristol, on the 24th of September. After a tedious and stormy voyage, they arrived in England the first week in December. He became a fellow of the Royal Society in 1789, and was among the first members of the Linnæan Society, founded in 1788.

On the 20th of March, 1794, Dr. Sibthorp set out on his second tour to Greece. He travelled to Constantinople in the train of Mr. Liston, ambassador to the Porte, and was attended by Francis Borone, as a botanical assistant. They reached Constantinople on the 19th of May, not without Dr. Sibthorp's having suffered much from the fatigues of the journey, which had brought on a bilious fever. He soon recovered his health at Constantinople, where he was joined by his friend Mr. Hawkins from Crete. Towards the end of August they made an excursion into Bithynia, and climbed to the summit of Olympus, whence they brought a fresh botanical harvest. Dr. Sibthorp discovered at Fanâr an aged Greek botanist, Dr. Dimitri Argyræmi, who had known the Danish traveller Forskall, and who was possessed of some works of Linnæus. Recovered health caused Dr. Sibthorp to set out with alacrity on his voyage to Greece, on the 9th of September. Passing down the Hellespont, on the 13th, with a light but favorable breeze, they anchored at Koum Cale, in the Troad, spent two days in examining the plains of Troy, and then proceeded to the Isles of Imbros and Lemnos. On the 25th they anchored at Mount Athos, and passed ten days in examining some of the convents and hermitages, with the romantic scenery, and botanical rarities, of

that singular spot, on all which Dr. Sibthorp descants at length, with great delight, in his journal. Their departure was for some time prevented, by a few Barbary pirates hovering on the coast, whom these monks, unlike the priests of the Athenian Bacchus, were not potent or valiant enough to defeat, or to turn into dolphins. Our voyagers sailed on the 5th of October, and on the 7th landed at Skiatho. Hence, on the 11th, they proceeded down the strait of Negropont, and on the 13th passed under the bridge of five arches which connects that island with the main land of Greece. On the 15th, at noon, they entered the harbour of the Pyraeus, and proceeded to Athens, where the four succeeding weeks were employed in collecting information relative to the present state of the government, the manufactures, and the domestic economy of that celebrated spot. Here Dr. Sibthorp lost his assistant Borone, who perished by an accidental fall from a window, in his sleep, on or about the 20th of October. November 16th Dr. Sibthorp and Mr Hawkins left Athens by the ancient Eleusinian way, where the classical streams of the Cephissus, the heights of Helicon and Parnassus lay before them. They proceeded to Patras and to Zante, where they arrived in the middle of December, enriched with a large collection of seeds, the only botanical tribute that could, at this season, be collected from those famous mountains. An apothecary at Zante furnished Dr. Sibthorp with an ample and splendid herbarium, of the plants of that island, with their modern Greek names; nor did the winter pass unprofitably or unpleasantly in this sequestered spot; where neither agreeable society, nor copious information relative to our learned travellers' various objects, was wanting. The season was sufficiently favorable, in the middle of February 1795, to allow them to visit the Morea, of which peninsula they made the complete circuit in somewhat more than two months. The violet and primrose welcomed them in the plains of Arcadia; and the Narcissus tazetta, which Dr. Sibthorp was disposed to think the true poetic Narcissus, decorated in profusion the banks of the Alpheus. The barbarian horde, under whose escort they were obliged to travel, had taste enough to collect nosegays of these flowers. The oaks of the Arcadian mountains presented them with the true ancient miseltoe, *loranthus europæus*, which still serves to make birdlime; whilst our miseltoe, *viscum album*, in Greece grows only on the silver fir. The jay, still called by its ancient name *κισσα*, which is generally taken for the magpie, was screaming among these oaks: and the water ouzel, *sturnus cinclus*, flying along the rocky sides of the alpine rivulets of Arcadia, presented itself to Dr. Sibthorp's recollection, as probably the white blackbird, which Aristotle says is peculiar to the neighbourhood of Mount Cyllene. Proceeding to Argos, and thence to Mycena, the travellers were highly gratified by finding, on the gate of the latter, those ancient lions which Pausanias describes as the work of the Cyclopes; and near it the reputed tomb of Agamemnon, a circular building, formed of immense masses of stone, placed with such geometrical precision, though without mortar, that not

one had given way. That which forms the portal is described by Dr. Sibthorp as the largest stone he ever saw employed in any edifice. A number of fragments of vases, like those commonly called Etruscan, lay among the ruins of Mycena. At Hermione, now called Castri, in the Argolic peninsula, famous for the purple dye anciently prepared there, a vast pile of the shells from which that dye was obtained, and still denominated porphyri, served to ascertain the species, which is *murex trunculus* of Linnæus, figured by Fabius Columna in his rare and learned work, *de Purpura*, under the name of *Purpura nostras violacea*. See PURPLE FISH. From this place Dr. Sibthorp and his friend intended to have coasted along the bay of Argos in a boat, but the sea was then infested with pirates, which obliged them to give up that project, and to return by land to Argos, whence they proceeded to Corinth, Patras, and by way of Elis to Pyrgos. Here they obtained another escort from Said Aga, to whose protection they had before been indebted, and safely reached Calamata, on the gulf of Corone, where they were detained by the celebration of Easter, on the 12th of April, amid a profusion of sky-rockets and crackers. Proceeding in a boat along the barren and craggy shore, covered with bushy and prickly euphorbia, they reached Cardamoula. Here the Greeks were tolerably free from the tyranny of the Turks, and their persons and demeanour exhibited less marks of degeneracy.

From Cardamoula the travellers were escorted by the dependents of a hospitable Grecian chief, along a precipitous road, to Mistra, where they had the unexpected pleasure of meeting a party of their English friends, in the garb of Tartars, with whom they explored the site of ancient Sparta. After returning to Calamata, and surveying from the summit of a neighbouring precipice the ruins of Messenia, with the rich plains watered by the Paniscus, and bounded by the hills of Laconia, Dr. Sibthorp and Mr. Hawkins hastened to Corone, where a Venetian vessel waited to convey them to Zante, which place they reached on the 29th of April. Here Dr. Sibthorp parted from the companion of his tour, whom he was destined never to see again, but in whose friendship he safely confided in his last hours. Mr. Hawkins returned to Greece; while the subject of our memoir, leaving Zante on the 1st of May, experienced a most tedious voyage of twenty-four days to Otranto, though five days is the most usual time for that passage. He touched at the island of Cephalonia, and next at Preversa, on the Grecian shore, where, being detained by a contrary wind, he employed the 7th of May in visiting the ruins of Nicopolis. The weather was unfavorable, and Dr. Sibthorp here caught a severe cold, from which he never recovered. It seems to have proved the exciting cause of that disease which had long been latent in the mesenteric and pulmonary glands, and which terminated in a consumption. Being obliged by the weather to put in at the little island of Fanno, May 11th, the violent north-west wind 'continued,' as he too expressively says in his journal, 'to nurse his cough and fever.' He was confined to his bed, in a miserable hovel, to which, after frequent

attempts to sail, he was driven back six times by the unfavorable wind. At length the vessel was enabled to cast anchor in the port of Otranto on the 24th of May. Here he was obliged to submit to a quarantine of three weeks, part of which, indeed, was allowed to be spent in proceeding to Ancona. Thence he passed through Germany and Holland to England in the autumn of 1795, and his few succeeding months were chiefly marked by the progress of an unconquerable disease, for which the climates of Devonshire and Bath were, as usual, resorted to in vain. He died at Bath, February 8th, 1796, in the thirty-eighth year of his age, and lies interred in the abbey church.

By his will, dated Ashburton, January 12th, 1796, Dr. Sibthorp gives a freehold estate in Oxfordshire to the university of Oxford, for the purpose of first publishing his *Flora Græca*, in ten folio volumes, with 100 colored plates in each, and a *Prodromus* of the same work, in 8vo., without plates. His executors, the honorable Thomas Wenman, John Hawkins, and Thomas Platt, esqrs., were to appoint a sufficiently competent editor of these works, to whom the manuscripts, drawings, and specimens, were to be confided. The plan of the *Prodromus* was drawn out by Dr. Sibthorp, but nothing of the *Flora* except the figures was prepared, nor any botanical characters or descriptions whatever.

The only work which professor John Sibthorp published in his life time is a *Flora Oxoniensis*, in one volume 8vo., printed in 1794. It has the merit of being entirely founded on his own personal observation. The species enumerated amount to 1200, all gathered by himself, and disposed according to the Linnæan system, with the alterations of Thunberg, which were then new, but which are now not admitted as improvements. The adoption, though imperfect, of Hedwig's genera of mosses in this *Flora*, must be esteemed a more fortunate measure.

SIBTHORPIA, in botany, a genus of the angiospermia order and didynamia class of plants; natural order doubtful: *CAL.* spreading, and divided into five parts almost to the base: *COR.* divided into five parts in the same manner, which are rounded, equal, spreading, and of the length of the calyx; the stamina grow in pairs at a distance from each other: *CAPS.* compressed, orbicular, bilocular, the partition being transverse. There are two species, viz. 1. *S. evolvulacea*; and, 2. *S. Europæa*, or bastard moneywort, is a native of South Britain. The stems are slender, and creeping; the leaves are small, round, and notched. The flowers grow under the wings of the leaves, are small, and of a pale red color. It blossoms from July to September, and is found in Cornwall on the banks of rivulets.

SIBYLS, Lat. *sibyllæ*, in pagan antiquity, certain women said to have been endowed with a prophetic spirit, and to have delivered oracles, showing the fates and revolutions of kingdoms. Their number is unknown. Plato speaks of one, others of two, Pliny of three, Ælian of four, and Varro of ten; which last opinion is universally adopted by the learned. These ten Sibyls generally reside in the following places, Persia, Libya,

Delphi, Cumæ in Italy, Erythræa, Samos, Cumæ in Æolia, Marpessa on the Hellespont, Ancyræ in Phrygia, and Tiburtis. The most celebrated of the Sibyls is that of Cumæ in Italy, whom some have called by the different names of Amalthæa, Demiphile, Herophile, Daphne, Manto, Phemonoe, and Deiphobe. It is said that Apollo became enamoured of her, and offered to give her whatever she should ask. The Sibyl demanded to live as many years as she had grains of sand in her hand, but unfortunately forgot to ask for the continuance of her beauty, health, vigor, and bloom. The god granted her request, but she refused to gratify his passion, though he offered her perpetual youth and beauty. Some time after she became old and decrepit, her form decayed, melancholy paleness and haggard looks succeeded to bloom and cheerfulness. She had already lived about 700 years when Æneas came to Italy, and had three centuries more to live before her years were as numerous as the grains of sand which she had in her hand. She gave Æneas instructions how to find his father in the infernal regions, and even conducted him to the entrance of hell. It was usual for the Sibyl to write her prophecies on leaves, which she placed at the entrance of her cave; and it required particular care in such as consulted her to take up these leaves before they were dispersed by the wind, as their meaning then became incomprehensible. According to the most authentic historians of the Roman republic, the Erythrean Sibyl came to the palace of Tarquin II., with nine volumes, which she offered to sell for a very high price. The monarch disregarded her, and she immediately disappeared, and soon after returned, when she had burned three of the volumes. She asked the same price for the remaining six books; and, when Tarquin refused to buy them, she burned three more, and still persisted in demanding the same sum of money for the three that were left. This extraordinary behaviour astonished Tarquin; he bought the books, and the Sibyl instantly vanished, and never after appeared to the world. These books were preserved with great care by the monarch, and called the Sibylline verses. A college of priests was appointed to have the care of them; and such reverence did the Romans entertain for these prophetic books that they were consulted with the greatest solemnity, and only when the state seemed to be in danger. When the capitol was burnt, in the troubles of Sylla, the Sibylline verses, which were deposited there, perished in the conflagration; and, to repair the loss which the republic seemed to have sustained, commissioners were immediately sent to different parts of Greece to collect whatever verses could be found of the inspired writings of the Sibyls. The fate of these Sibylline verses which were collected after the conflagration of the capitol is unknown. There are now many Sibylline verses extant, but they are universally reckoned spurious; and it is said that they were composed in the second century by some of the followers of Christianity, who wished to convince the heathens of their error, by assisting the cause of truth with the arms of pious artifice.

SICAMBRI, or **SYGAMBRI**, an ancient nation of Germany, who were conquered by the Romans. They revolted under Augustus, who marched against them, but did not entirely subdue them. Drusus, however, conquered them, and they were carried away from their native country to inhabit some of the more western provinces of Gaul. (Dio. 54. Tac. ii. Ann. 26). See **SAXONS**.

SICAMBRAI, the country of the Sicambri, on the banks of the Rhine. It now forms the ci-devant province of Guelderland.

SICAMORE, *n. s.* Lat. *sicamorus*. A tree Of trees you have the palm, olive, and *sicamore*.
Peacham.

SICANA. See **SICANIA**.

SICANI, an ancient people of Spain, who emigrated from their native country into Italy, and afterwards into Sicily, which they called Sicania. See **SICILY**.

SICANIA, or **SICANA**, an ancient name of Sicily, from the Sicani, or their king Sicanus.

SICARD (Roch Ambrose Cucurron), successor of the abbé l'Epée at the Parisian institution for the education of the deaf and dumb, was born September 20th, 1742, at Fousseret, near Toulouse, in which city he completed his studies for holy orders. He, however, devoted himself to the instruction of persons born deaf and dumb, and became director of a school established for that purpose by the archbishop of Bourdeaux; whence in 1789 he removed to Paris, and was chosen successor to the abbé l'Epée. On the 26th of August 1792 he was arrested in the midst of his pupils, by order of the commune of Paris: and, notwithstanding various efforts of his friends, was on the 2nd of September transferred to the prison of the abbey of St. Germain, where he narrowly escaped being a victim in the ensuing massacres. After a few days' imprisonment he was set at liberty. On the foundation of the normal school, in 1795, he was appointed professor of grammar; and about the same time was made a member of the Institute. He now became one of the conductors of a periodical work entitled *Annales Religieuses, Politiques, et Littéraires*, on account of which he was included by the directory in the number of the journalists exiled to Synamari. This persecution obliged him to conceal himself, and it was not till after the overthrow of the directory that he was able to return to his situation. The old age of Sicard was clouded with misfortunes arising from his own improvidence, and Buonaparte, to whom he applied in his difficulties, treated him with neglect. After the restoration he was more fortunate, being successively made a knight of the legion of honor, administrator of the hospital of Quinze Vingts, administrator of that of blind youths, and knight of the order of St. Michael. He was also honored with attentions from the foreign princes who visited Paris in 1814 and 1815. His death took place May 10th 1822. He was the author, besides other works, of *Elémens de Grammaire générale appliquée à la Langue Française*, 2 vols. 8vo.; *Cours d'Instruction d'un Sourd-muet de Naissance*, 8vo.; and *Théorie des Signes pour l'Instruction des Sourds-muets*, 2 vols. 8vo. He

also contrived a method of pasigraphy, or universal language.

SICANUS, 1. a king of Sicani; and 2. A river of Spain, one of which gave the name Sicania to the island of Sicily.

SICCITY, *n. s.* Fr. *siccité*, Lat. *siccitas*, of *siccus*. Dryness; aridity; want of moisture.

That which is coagulated by a fiery *siccity* will suffer colliquation from an aqueous humidity, as salt and sugar.
Browne.

The reason some attempt to make out from the *siccity* and dryness of its flesh. *Id. Vulgar Errours.*

In application of medicaments, consider what degree of heat and *siccity* is proper.

Wiscman's Surgery.

SICE, *n. s.* Fr. *six*. The number six or dice.

My study was to cog the dice,
And dexterously to throw the lucky *sice*;
To shun ames-ace, that swept my stakes away.

Dryden.

SICELIDES; 1. the inhabitants of Sicily:—

2. A name given to the Muses, by Virgil, because Theocritus, whose Bucolic poetry he professed to imitate, was a native of Sicily.—
Virg. Ecl. 4.

SICERA, a name given to any inebriating liquor by the Hellenistic Jews. St. Chrysostom, Theodoret, and Theophilus of Antioch, who were Syrians, and who therefore ought to know the signification and nature of *sicera*, assure us that it properly signifies palm-wine. Pliny acknowledges that the wine of the palm tree was very well known through all the east, and that it was made by taking a bushel of the dates of the palm-tree, and throwing them into three gallons of water; then squeezing out the juice, it would intoxicate like wine. The wine of the palm-tree is white: when it is drunk new, it has the taste of the cocoa, and is sweet as honey. When it is kept longer, it grows strong and intoxicates. After long keeping, it becomes vinegar.

SICIL, *adj.* A corruption of such. See **SUCH**.

I thought the soul would have made me rich;
But now I wote it is nothing *sich*;
For either the shepherds been idle and still,
And led of their sheep what they will.

Spenser's Pastorals.

SICHEUS, **SICHARBUS**, or **ACHERBAS**, the son of Phisthenes, uncle and husband of Eliza, or Dido, and priest of Hercules; who was murdered by Pygmalion, his wife's brother. See **DIDO** and **PYGMALION**.

SICILIA (Lat.), Sicily. See **SICILY**. The ancient name of the three capes of Sicily were Pelores, Pachynum, and Lilybeum.

SICILIAN (from Sicilia), of, or belonging to, or produced from, or in Sicily.

SICILIAN, in music, denotes a kind of gay sprightly air, or dance, probably invented in Sicily, somewhat of the nature of an English jig: usually marked with the characters $\frac{6}{8}$, or $\frac{12}{8}$. It

consists of two strains; the first of four, and the second of eight, bars or measures.

SICILIAN VESPERS, a horrible massacre of the French in Sicily, A. D. 1282. See **NAPLES**.

SICILIES, **KING OF THE TWO**, the title of the king of Naples; for Naples and Sicily are the

two Sicilies meant, there being no other place of the name in Europe, or perhaps on the globe; nor is Naples itself properly so named, excepting in this political connexion. See NAPLES.

SICILY, a large island in the Mediterranean Sea, adjoining to the southern extremity of Italy, and extending from lat. $36^{\circ} 25'$ to lat. $38^{\circ} 25' N.$, and from long. $12^{\circ} 50'$ to long. $16^{\circ} 5' E.$

Anciently this island was called Sicania, Sicilia, and Trinacria, or Triquetra; the two former from the Sicani and Siculi, who peopled a considerable part of the country; the two latter from its triangular figure. Its first inhabitants, according to the most respectable ancient authors, were the Cyclopes and Læstrigones, who are said to have settled in the countries adjoining to Mount Ætna; but of their origin we know nothing, except what is related by the poets. After them came the Sicani, who called themselves the original inhabitants of the country; but several ancient historians inform us that they came from a country in Spain watered by the river Sicanus. Diodorus, however, is of opinion that the Sicani were the most ancient inhabitants of this island. He tells us that they were in possession of the whole, and applied themselves to cultivate and improve the ground in the neighbourhood of Ætna, which was the most fruitful part of the island; they built several small towns and villages, on the hills, to secure themselves against thieves and robbers; and were governed, not by one prince, but each city and district by its own king. Thus they lived till Ætna began to throw out flames, and forced them to retire to the western parts of the island, which they continued to inhabit in the time of Thucydides. Some Trojans, after the destruction of their city, landed in the island, settled among the Sicani, and built the cities of Eryx and Egesta, uniting themselves with them, and taking the general name of Elymi or Elymæi. They were afterwards joined by some Phocenses, who settled here on their return from the siege of Troy. After the Sicani had for many ages enjoyed an undisturbed possession of the whole of Sicily, or such parts of it as they chose to inhabit, they were visited by the Siculi, who were the ancient inhabitants of Ausonia properly so called; but, being driven out thence by the Opici, they took refuge in the island of Sicily. Not being contented with the narrow bounds allowed them by the Sicani, they began to encroach upon their neighbours; upon which a war ensuing, the Sicani were utterly defeated, and confined to a corner of the island, the name of which was now changed from Sicania into that of Sicilia.

Both the ancients and moderns have supposed that Sicily was separated from the continent by an earthquake, the strait of Messina, between it and Calabria, being only a mile in breadth, from Cape Faro in Sicily, to Cape Volpe in Calabria, but widens as it proceeds, and at Messina, four leagues from cape Faro, is four miles. Pomponius Mela observes, 'Sicilia, ut ferunt, aliquando agro Brutio adnexa.' To the same purpose Virgil (*Æn. i. iii. v. 414*) says:—

Hæc loca vi quondam, et vasta convulsa ruina
Dissiluisse ferunt, cum protinus utraque Tellus

Una foret. Venit medio vi pontus et undis
Hesperium siculo latus absceidit.

Silius Italicus details this event, lib. xiv. :—

Ausoniæ pars magna jacet Trinacria Tellus
Ut semel expugnante noto, et vestantibus undis
Acceptis freta cœrules propulsa tridente,
Namque per occultum cœca vi turbinis olim
Impactum Pelagus lacerata viscera terræ
Disceidit, et medio perrumpens arva profundo,
Cum populis pariter convulsas transtulit urbes.

Claudian states positively

Trinacria quondam Italiæ pars fuit.

On cape Faro, the ancient Pelorium, is a light-house, or pharos, whence its modern name, and whence also the strait is called by seamen the Faro of Messina.

Sicily is throughout intersected by ridges of hills, but none of any considerable height except Mount Ætna, one of the most celebrated volcanoes of Europe (see *Ætna*), and Mount Eryx, on the north-west, which, like Ætna, is isolated, and was anciently celebrated for a temple of Venus Erycina. The climate approaches to that of the tropics, the only appearance of winter being towards the summit of Ætna, which retains the snow throughout the year, and supplies a valuable object of commerce. The natural fertility of the island, which formerly acquired it the name of the granary of Rome, remains undiminished, but the sloth of the present inhabitants scarcely draws from the soil more than sufficient for their own nourishment. In the mineral kingdom it possesses gold, silver, lead, copper, antimony, and sulphur.

The labor of the fields, and even the dragging of carts and waggons on the roads, is in Sicily generally performed by oxen. For travelling, recourse is had to mules, who here, as in other parts of the south of Europe, discover great steadiness in traversing a wretched road, and no less patience in supporting fatigue. In general the breed of cattle and horses has been much neglected, and is at present advancing very slowly towards improvement. Game is found in abundance, and most of the wild animals of the continent.

The only *manufacturing* establishments of extent are at Palermo, Messina, and Catania: they consist of silk, cotton, and linen; in part also of woollens, though the wool of the island is of indifferent quality. If to these we add hats, cutlery, harness, carriages, and household furniture, made at Palermo and the principal towns, we have the amount of the Sicilian manufactures. A number of articles for the peasantry are in this, as in other backward countries, made at their own houses, without the benefit of machinery or division of labor. Hence comparatively few exchanges, a slow intercourse between town and country, and in general those symptoms of stagnation which strike an Englishman so forcibly on visiting a foreign country.

In respect to *commerce*, Sicily, from the variety of its products, the excellence of several of its harbours, and the general safety of its coast for navigation, would, under an enlightened government, acquire great importance. The exports and imports are, however, comparatively small, neither

exceeding £1,500,000 for the whole island. Here are no banks, no insurance companies, and very little confidence in government. The interior trade is cramped by the want of roads, the navigation by the quarantine laws, which are said to be enforced very unequally, and to be unfairly dispensed with in favor of those who are in connexion with the public officers. The occupancy of the island by the British troops, from 1806 to 1816, was a source of considerable advantage; and in the latter year a treaty was concluded between the courts of Naples and London, affording considerable privileges to the British. The chief exports of Sicily are silk, corn, salt, olive oil, sumac, wine, fruits of various kinds; also goat, kid, and other skins. The imports consist of colonial produce, hardware, jewellery, lead, and manufactured articles in great variety, but small quantity. Of the fisheries carried on along the coast the principal is the tunny fishery. Money accounts are here kept in ounces, taris, and grains.

1 grain is equal to $\frac{1}{4}$ d. sterling.

20 grains = 1 tari or $\frac{1}{5}$ d. sterling.

30 taris = 1 ounce or 12s. 6d. sterling.

Of late, attempts have been made to raise the Sicilian from a provincial to a national tongue. A dictionary has been printed, and several poets have published in their native language. In ancient times Sicily produced several writers of note, as Theocritus, Empedocles, Stesichorus, and Epicarmus; also painters and sculptors not unworthy of competition with those of Greece. In modern times, or rather since the beginning of the seventeenth century, there have appeared some successful candidates in the belles lettres, poetry, and natural history; and at present Palermo, Catania, and Messina, contain individuals of distinguished attainments; but their efforts have been discouraged by the want of a free press, the inadequacy of the public libraries, and the difficulty of intercourse with the more enlightened part of Europe. Education may be said to be in almost the same incipient state: there has yet been no general establishment of elementary schools; and the colleges of Palermo, Catania, and other large towns, have been conducted on a very antiquated plan, Latin and the doctrines of the Catholic church having excluded every branch of ordinary knowledge. The schools called Scuoli Normali, established in 1789, are on a better footing, the pupils being limited in number, and the teachers subjected to a previous examination. Girls, as in other Catholic countries, are put, at the age of eight or ten, into a convent or retiro, where, during six or eight years, they are taught little else than reading, writing, or the ceremonies of the Catholic faith. Fortunately the new plan of teaching (of Bell and Lancaster) is at present (1820) finding its way into Sicily. The religion of Sicily is the Catholic; the number of ecclesiastics in Sicily is said to amount to 70,000, exclusive of a still greater number of monks and nuns; all, or almost all, marked by the uniform character of ignorance and superstition.

The Sicilian parliament is composed of three branches: the nobles to the number of 227; the

prelates to the number of sixty-one; the demanial or deputies from universities, cities, and crown estates, to the number of only forty-three. Its authority is in a great measure nominal, and it has done little or nothing towards repressing the abuses which prevail notoriously in every branch of administration. The public officers are so inadequately paid as necessarily to have recourse to peculation. The hospitals and other public establishments, even when well endowed, are in a very uncomfortable state. As to the administration of justice, the laws, however good in the letter, are inoperative against a delinquent of influence or fortune. The judges are open to all kinds of corruption. The rarity of capital punishment would claim our praise were it not accompanied, in cases of doubtful evidence, by a recourse to torture: in short no country could be more in want of that political reform which was begun by the British government when in possession of the island, and is now (1821) likely to be carried on by the inhabitants themselves.

The revenue of Sicily is computed at £1,000,000; a sum that would not be exorbitant were the taxes judicious in their nature, and equal in the mode of levying; but, until lately, the barons or landholders were to a certain degree exempt, and the burden was unmercifully imposed on the commons. The executive branch is subject to no enquiry or responsibility in regard to the application of the public funds. The Sicilian army in time of peace does not exceed 10,000 men; the pay of the soldiers, adequate only to their subsistence in a plentiful year, makes them dependent on public charity in a season of dearth and scarcity. A number of the officers are foreigners. The navy is limited to one ship of the line, two frigates, and five sloops: the gun boats are numerous; but the whole is in a poor state.

Sicily has been recently divided into seven intendancies, instead of the three great provinces which before formed its component parts. These intendancies, and their population, and principal cities, are as follows:—

Intendancies.	Population in 1817.	Capitals and their population.	
Palermo	405,231	Palermo	180,000
Messina	236,784	Messina	44,650
Catania	289,406	Catania	45,081
Siragosa	192,710	Siragosa	13,850
Caltanissetta	155,225	Caltanissetta	15,627
Girgente	288,877	Girgente	14,882
Trapani	145,712	Trapani	24,330
	1,713,945		

The principal promontories, most of which, as well as its rivers, are celebrated by the ancient poets, are Cape Faro, the north-east point. Cape Passaro (Pachynum), the south point, on an island, half a league from the main, and a mile in circuit, surrounded by rocks: on it is a fortified tower and light-house. On the south coast from the east are Cape Scalambri, Cape St.

Marco, and Cape Sorello. Cape Bæo (Lyli-beum), at the west end, is a low promontory, north of which is the island San Pantaleo (Motya). On the north coast are Cape St. Vito, the west point of the gulf of Castel-a-Mare, Cape Orlando, Cape Bianco, and others.

The north coast, being bounded by mountains (Nebrodes Mons), has but few streams that deserve the name of rivers. Those of the east and south are more considerable. Amongst the former are the Alcantara (Onobala), south of Taormina, the Giaretta (Symæthus), south of Catania, the largest of the island, and the Atellaro, north of Cape Passaro. On the south coast the rivers are the Salso (Himera), which empties itself at Alicata, the Platani (Camicus), and the Bellici (Hypsa).

Messina (Messana), from its ancient splendor, as well as from being formerly the residence of the viceroy for six months of the year, disputes the honor of being the capital: it is situated near the north extremity of the east coast. The ravages of the plague in 1743, and other causes, have greatly reduced its population, which is thought not to exceed 25,000, though it has means of containing five times that number. Its port is entirely natural, and one of the best in Europe, being formed by a semicircular peninsula on the south-east, five miles in circuit, with an entrance three-quarters of a mile wide, and capable of holding 1000 sail in thirty-five to forty fathoms depth. The largest vessels can also make fast to the quay, which lines the peninsula for a mile in length. The harbour is protected by the castle of St. Salvador, on the isthmus of the peninsula, by four forts on its points, and by a battery on the west shore. With these advantages, and that of being a free port, its trade is trifling.

Taormina (Tauromenium), a celebrated city of antiquity, is now a poor village, on a hill two miles above the level of the sea, at the foot of which is the village and road of Giardini. At Taormina are seen the most entire remains of a Roman theatre in Italy, with other antiquities.

Jaci d'Aquila is a little town at the mouth of the Fiume-Freddo, cold river, the ancient Acis, celebrated by the fable of Acis and Galatea, and whose waters, though said to be colder than ice, never freeze. They were praised by the ancients for their salubrity, but at present are thought to be poisonous from containing vitriol.

Catania, the third city of Sicily, contains 40,000 inhabitants. It has several times been destroyed by earthquakes and eruptions of *Ætna*, whose foot is but five miles distant. Since the earthquake in 1693, which totally overturned it, it has been rebuilt on a regular plan, with straight and wide streets, and the houses only one story. It has a good port, but little or no trade.

Augusta, a fortified town of 9000 inhabitants, and a good port, is on the south side of an island, formerly a peninsula, but separated from the main by the earthquake of 1693.

Syracuse, called by the natives *Saragoza*, one of the most celebrated cities of the Roman empire, whose walls had 180 stades of circuit, is now a poor town of 14,000 inhabitants. The land on which it stands was anciently a peninsula, but the isthmus has been cut through for its defence.

Besides which it has a very strong citadel. Its two ancient ports still exist, the southern named Porto Maggiore (Portus Magnus), has six miles at its greatest breadth, and is entered by a strait one-third of a mile wide. In this port, twenty yards from the shore, a spring of fresh water bubbles up amidst the salt. The northern port, Porto Picolo (Portus Minor and Marmoreus), held the naval force of ancient Syracuse. The fountain of *Arethusa*, celebrated by poets and historians, and to which divine honors were paid, is now a brackish stream, which issues suddenly from the earth by two openings, and serves to wash the dirty rags of the modern Syracusians.

About 300 years after the arrival of the Siculi, the island first began to be known to the Greeks, who established various colonies, and built many cities in different parts of the island; and it is only from the time of their arrival that we have any history of the island. The first of the Greeks that came into Sicily were the Chalcidians of Eubœa, under the conduct of Thucles, who built Naxos, and a famous altar of Apollo, which, as Thucydides tells us, was still standing in his time without the city. The year after, which was, according to Dionysius Halicarnassensis, the third of the seventeenth Olympiad, Archias the Corinthian, one of the Heraclidae, laid the foundations of Syracuse. Seven years after, a new colony of Chalcidians founded Leontini and Catana, after having driven out the Siculi, who inhabited that tract. About the same time, Lamas with a colony from Megara, a city of Achaia, settled on the river Pantacius, at a place called Trotium, where his adventurers lived some time in common with the Chalcidians of Leontini; but, being driven thence by the Leontines, he built the city of Thapsus, where he died. Upon his death, the colony left Thapsus; and under the conduct of Hyblon, king of the Siculi, founded Megara Hyblæa, where they resided 245 years, till they were driven out by Gelon, tyrant of Syracuse. During their abode at Megara they sent one Pamilus, who was come from Megarian Achaia their original city, to build Selinus. This city was founded about 100 years after the foundation of Megara. Antiphemus and Entimus, the former a Rhodian, the other a Cretan, led each a colony of their countrymen, and jointly built the city of Gela on a river of the same name, establishing in their new settlement the Doric customs, about forty-five years after the founding of Syracuse. The inhabitants of Gela founded Agrigentum 108 years after their arrival in Sicily, and introduced the same customs there. A few years after, Zancle was built by the pirates of Cumæ in Italy; but chiefly peopled by the Chalcidians, Samians, and Ionians, who chose rather to seek new settlements than live under the Persian yoke. Some time after Anaxales, tyrant of Rhegium, drove out the ancient proprietors; and, dividing his lands among his followers, called the city *Messena*, or *Messene*, which was the name of his native city in Peloponnesus. The city of Himera was founded by the Zancleans under the direction of Eucleides, Simus, and Sacon; but peopled by the Chalcidians and some Syracusau

exiles, who had been driven out by the contrary faction. The Syracusians built Acraë, Chasmenæ, and Camarina; the first seventy years, the second ninety, and the third 135, after the foundation of their own city. This is the account which Thucydides, a most judicious and exact writer, gives us of the various nations, whether Greeks or barbarians, who settled in Sicily. Strabo counts, among the ancient inhabitants of Sicily, the Morgetes, who being driven out of Italy by the Oenotrians, settled in that part of the island where the ancient city of Morgantium stood. The Campani, who assumed the name of Mamertini, that is, invincible warriors, and the Carthaginians, who settled very early in Sicily, ought likewise to be counted among the ancient inhabitants of the island. Before this period the history of Sicily is blended with fables, like the early history of almost every other country. After the settlement of the Greeks in the island, its various revolutions have been traced from their several sources by many writers; but by none with greater accuracy or brevity than Mr. Swinburne. From his account of his Travels in the two Sicilies, we therefore quote the following concise history of this kingdom:—

‘Aristocracy prevailed at first in the Greek settlements, but soon made way for tyranny; which in its turn was expelled by democracy. One of the earliest destroyers of common liberty was Phalaris of Agrigentum, who reigned about A. A. C. 600. See PHALARIS. His example was contagious; a legion of tyrants sprang up, and not a commonwealth in the island escaped the lash of a usurper. Syracuse was most oppressed and torn to pieces by dissension; as its wealth and preponderance in the general scale held out a greater temptation than other cities to the ambition of wicked men. It requires the combined testimony of historians to enforce our belief of its wonderful prosperity, and the no less extraordinary tyranny of some of its sovereigns. These Grecian colonies attained to such excellence in arts and sciences as emboldened them frequently to vie with the learned and ingenious in the mother country: nay, often enabled them to bear away the palm of victory. There needs no stronger proof of their literary merits than a bare recital of the names of Archimedes, Theocritus, Gorgias, and Charondas. But the Sicilian Greeks were not destined to enjoy the sweets of their situation without molestation. Very soon after their arrival, the inhabitants of the neighbouring coast of Africa began to aspire to a share of Sicily. Carthage sent large bodies of forces at different times to establish their power in the island, and about 500 years before the Christian era they had made themselves masters of all the western parts of it. The Siculi retained possession of the midland country, and the south and east coasts were inhabited by the Greeks. About that time Gelo was chosen prince of Syracuse on account of his virtues, which grew still more conspicuous after his exaltation; had the example he set been followed by his successors, the advantages of freedom would never have been known or wished for by the Syracusans. The Carthaginians found in him a

vigorous opponent to their project of enslaving Sicily; a project invariably pursued, but never accomplished. Hiero I. succeeded his brother Gelo, and, contrary to the usual progression, began his reign by a display of bad qualities. Sensible of his error, and improved by experience, he afterwards adopted more equitable measures. At his death the Syracusans threw off the yoke, and for sixty years revelled in all the joys of freedom. Their peace was, however, disturbed by the Athenians and the Carthaginians. The latter plundered Agrigentum, and threatened ruin to the rest of the Grecian states; but a treaty of peace averted that storm. The Athenians, under pretence of supporting their allies the people of Segesta, but in reality from a thirst of dominion, invested Syracuse with a formidable land and naval armament under the command of Nicias; but in consequence of a rash indigested plan, ill conducted attacks, and inadequate supplies, their whole host was cut to pieces, or led away into captivity. Syracuse had scarcely time to breathe after her victory, ere intestine wars broke out, and raised Dionysius I. to supreme command.’ See DIONYSIUS. ‘Avarice, despotism, and cruelty, marked his reign; but his military enterprises were crowned with constant success.’ Like the modern tyrant of Europe, he patronised men of letters, and was even ambitious of literary fame. ‘He died in peace, and bequeathed a powerful sovereignty to a son of his name, tainted with the same and worse vices, but not endowed with equal capacity and martial ability; in such hands the rod of tyranny ceased to be formidable, and the tyrant was driven out of Sicily by the patriotic party; but matters were not sufficiently settled for popular government, and Dionysius II. resumed the sceptre for a while, till Timoleon forced him into perpetual exile.’

Liberty seemed now to be established on a permanent basis; but in Syracuse such prospects always proved illusory. Agathocles, a tyrant more inhuman than any preceding usurper, seized the throne, and deluged the country with blood. He was involved in a perilous contest with the Carthaginians, who obtained many advantages over him, drove his troops from port to port, and at last blocked up his capital. In this desperate situation, when all foreign helps were precluded, and hardly a resource remained at home, the genius of Agathocles compassed his deliverance by a plan that was imitated among the ancients by Hannibal, and among the moderns by the famous Cortes. He embarked with the flower of his army; forced his way through innumerable obstacles; landed in Africa; and, having burnt his fleet, routed the Carthaginians in a pitched battle, and laid their territory waste. Carthage seemed to be on the brink of ruin, and that hour might have marked her downfall had the Sicilian host been composed of patriotic soldiers, and not of ungovernable assassins; discord pervaded the victorious camp, murder and riot ensued; and the tyrant, after beholding his children and friends butchered before his face, escaped to Sicily, to meet a death as tragical as his crimes deserved. See AGATHOCLES. Anarchy now raged throughout the island, and every

fiction was reduced to the necessity of calling in the assistance of foreign power; among whom Pyrrhus king of Epirus took the lead, and reduced all parties to some degree of order and obedience. But ambition soon prompted him to invade those rights which he came to defend; he cast off the mask, and made Sicily feel under his sway as heavy a hand as that of its former oppressors; but the Sicilians soon assumed courage and strength enough to drive him out of the island. About this period the Mamertini, whom Mr. Swinburne indignantly styles a crew of miscreants, surprised Messina, and, after a general massacre of the citizens, established a republican form of government. See MAMERTINI. Their commonwealth became so troublesome a neighbour to the Greeks that Hiero II., who had been raised to the chief command at Syracuse in consideration of his superior wisdom and warlike talents, found himself necessitated to form a league with Carthage to destroy this nest of villains. In their distress the Mamertini implored the assistance of Rome, though the senate had recently punished with exemplary severity one of their own legions for a similar outrage committed at Rhegium. The virtue of the Romans gave way to the temptation, and the desire of extending their empire beyond the limits of Italy cast a veil over every odious circumstance attending this alliance. A Roman army crossed the Faro, relieved Messina, defeated the Carthaginians, and humbled Hiero into an ally of the republic. Thus began the first Punic war, which was carried on for many years in Sicily with various success.

The genius of Hamilcar Barcas supported the African cause under numberless disappointments, and the repeated overthrows of his colleagues; at last, finding his exertions ineffectual, he advised the Carthaginian rulers to purchase peace at the price of Sicily. Such a treaty was not likely to be observed longer than want of strength should curb the animosity of the vanquished party; when their vigor was recruited, Hannibal, son of Hamilcar, easily persuaded them to resume the contest, and for sixteen years waged war in the heart of the Roman territories. Meanwhile Hiero conducted himself with so much prudence that he retained the friendship of both parties, and preserved his portion of Sicily in perfect tranquillity. He died in extreme old age, beloved and respected both at home and abroad. See HIERO II. His grandson Hieronymus, forsaking this happy line of politics and contracting an alliance with Carthage, fell an early victim to the troubles which his own folly had excited. Once more, and for the last time, the Syracusans found themselves in possession of their independence; but the times were no longer suited to such a system; dissensions gained head and distracted the public councils. Carthage could not support them, or prevent Marcellus from undertaking the siege of Syracuse, immortalised by the mechanical efforts of Archimedes, and the immensity of the plunder. See SYRACUSE.

The Sicilians after this relinquished all martial ideas, and, during a long series of generations, turned their attention solely to the arts of

peace and the labors of agriculture. Their position in the centre of the Roman empire preserved them both from civil and foreign foes, except in two instances of a servile war. The rapacity of their governors was a more constant and insupportable evil. In this state of apathy and opulence Sicily remained down to the seventh century of our era, when the Saracens began to disturb its tranquillity. The barbarous nations of the north had before invaded and ravaged its coasts, but had not long kept possession. The Saracens were more fortunate. In 827 they availed themselves of quarrels among the Sicilians to subdue the country. Palermo was chosen for their capital, and the standard of Mahomet triumphed about 200 years. In 1038 George Maniaces was sent by the Greek emperor with a great army to attack Sicily. He made good his landing, and pushed his conquests with vigor; his success arose from the valor of some Norman troops, which were at that time unemployed and ready to sell their services to the best bidder. Maniaces repaid them with ingratitude; and by his absurd conduct gave the Mussulmans time to breathe, and the Normans a pretext and opportunity of invading the Imperial dominions in Italy. Robert and Roger of Hauteville afterwards conquered Sicily on their own account, not as mercenaries; for, having substantially settled their power on the continent, they turned their arms against this island in obedience to the dictates of zeal and ambition. After ten years struggle, the Saracens yielded up the rich prize, and Robert ceded it to his brother Roger, who assumed the title of great earl of Sicily, ruled the state with wisdom, and ranks deservedly among the greatest characters in history. He raised himself from the humble station of a poor younger son of a private gentleman, to the exalted dignity of a powerful monarch, by the sole force of his own genius and courage; he governed a nation of strangers with vigor and justice, and transmitted his possessions undisputed to his posterity. Such an assemblage of great qualities is well entitled to our admiration.

Earl Roger was succeeded by his son Simon, whose reign was short, and made way for a second son called Roger II. In 1127 this prince joined to his Sicilian possessions the whole inheritance of Robert Guiscard (see NAPLES), and assumed the regal style. The greatest part of his reign was taken up in quelling revolts in Italy, but Sicily enjoyed profound peace. In 1154 his son William ascended the throne, and passed his life in war and confusion. William II. succeeded his father and died without issue. His defeat by Saladin is noticed under the article EGYPT. Tancred, though basely born, was elected his successor, and after him his son William III., who was vanquished by Henry of Suabia. During the troubles that agitated the reign of his son, the emperor Frederick, peace appears to have been the lot of Sicily. A short-lived sedition, and a revolt of the Saracens, are the only commotions recorded. For greater security the Saracens were removed to Puglia, 400 years after the conquest of Sicily by their ancestors. Under Conrad and Manfred Sicily

remained quiet; and from that time the history of Sicily is related under the article NAPLES. At the death of Charles II. of Spain his spoils became an object of furious contention; and, at the peace of Utrecht, Sicily was ceded to Victor, duke of Savoy, who, not many years after, was forced by the emperor Charles VI. to relinquish that fine island, and take Sardinia as an equivalent. But, as the Spaniards had no concern in these bargains, they made a sudden attempt to recover Sicily, in which they failed, through the vigilance of the English admiral Byng. He destroyed their fleet in 1718, and compelled them to drop their scheme for a time. In 1734 the Spanish court resumed their design with success. The infant Charles drove the Germans out, and was crowned king of the two Sicilies at Palermo. When he passed into Spain, to take possession of that crown, he transferred the Sicilian diadem to his son Ferdinand III. of Sicily and IV. of Naples, and it has ever since remained in the possession of the same family. See NAPLES. We conclude the history of Sicily with a piece of very important local history. About 1785 Count Caraccioli was appointed viceroy. The government of this nobleman was very beneficial to Sicily, as he, in a great measure, cleared the island of the banditti that used to infest it, and made several excellent regulations for the establishment of social order and personal security. He deserves the thanks of every well-wisher to mankind for having abolished the court of inquisition which had been established in this country by Ferdinand the Catholic, and made dependent on the authority of the grand inquisitor of Spain. Its last auto-da-fe was held in 1724, when two persons were burnt. At length Charles III. rendered it independent of the Spanish inquisitor, and abridged its power, by forbidding it to make use of the torture, and to inflict public punishments. The marchese Squillace and his successor for the marchese Tanucci, were both enemies to the hierarchy; and, during their vice-royalties, took care to appoint sensible and liberal men to the office of inquisitor; the last of whom was Ventimiglia, a man of a most humane and amiable character, who heartily wished for the abolition of this diabolical court, and readily contributed towards it. While he held the office of inquisitor, he always endeavoured to procure the acquittal of the accused; and, when he could succeed no other way, would pretend some informality in the trial. The total annihilation of this instrument of the worst of tyranny was reserved for Caraccioli. A priest, being accused to the inquisition, was dragged out of his house and thrown into the dungeon. He was condemned; but on account of informality, and a violation of justice in the trials, he appealed to the viceroy, who appointed a committee of jurists to examine the process. The inquisitor refused to acknowledge the authority of this commission; pretending that to expose the secrets of the holy office, and to submit its decisions to the examination of lay judges, would be so inconsistent with his duty, that he would see the inquisition abolished rather than consent to it. Caraccioli took him at his word, and procured

a royal mandate by which the holy office was at once annihilated. He assembled all the nobility, judges, and bishops, on the 27th of March, 1782, in the palace of the inquisition, and commanded the king's order to be read; after which he took possession of the archives, and caused all the prisons to be set open: in these were at that time only two prisoners who had been condemned to perpetual confinement for witchcraft. The papers relating to the finances were preserved; but all the rest were publicly burned. The possessions of the holy office were assigned to the use of churches and charitable institutions: but the officers then belonging to it retained their salaries during their lives. The palace itself is converted into a custom-house, and the place where heretics were formerly roasted alive, for the honor of the Catholic faith, is now changed into a public garden. The cognizance of offences against orthodoxy is committed to the bishops; but they cannot cite any one to appear before them without permission from the viceroy; neither can they confine any person in a solitary prison, nor deny him the privilege of writing to his friends, and conversing freely with his advocate. In 1798 the king of the two Sicilies having irritated the French republicans, by taking part in the war, they soon made reprisals and obliged him to flee for refuge, with the whole royal family, on board the British fleet under lord Nelson; who landed them safely at Palermo in Sicily, on the 27th of December, where they continued till the French were finally expelled from Italy; after which they returned to Naples. Thence they were again driven in the beginning of the year 1806: NAPLES, see that article, was given to Buonaparte's brother-in-law, Murat; until, in May, 1815, he participated in the general overthrow of that despot's schemes; and, in the June of that year, the old royal family was restored.

SICK, *adj.* & *v. n.*

SICK'EN, *v. a.* & *v. n.*

SICK'LY, *adv.*, *adj.*, & *v. a.*

SICK'NESS, *n. s.*

Saxon, *reoc*;

Dutch, *sick*. Aff-

flicted with dis-

ease; with *of* be-

fore the disease; disordered; corrupted; disgusted: as a verb neuter (obsolete) to take a disease: to sicken, verb active, is to make sick; disease; weaken: as a verb neuter, to grow sick; grow weak; decay; be filled with disgust: the adverb, adjective, and noun substantive following, correspond.

Himself took our infirmities and bare our sicknesses.
Matthew.

In poison there is physic; and this news,
That would, had I been well, have made me sick,
Being sick, hath in some measure made me well.

Shakespeare.

Cassius I am *sick* of many griefs *Id. Julius Caesar.*

What we oft do best,

By *sick* interpreters, or weak ones, is
Not ours, or not allowed: what worst, as oft
Hitting a grosser quality, is cried up
For our best act. *Id. Henry VIII*

A little time before

Our great grandsire Edward *sick'd* and died.

Id. Henry IV

Kinsmen of mine have

By this so *sicken'd* their estates, that never
They shall abound as formerly. *Id. Henry VIII.*

I know the more one *sickens* the worse he is.

Shakspeare.

Impute

His words to wayward *sickliness* and age.

Id. Richard II.

We wear our health but *sickly* in his life,

Which in his death were perfect. *Id. Macbeth.*

I'm fallen out with more headier will,

To take the indisposed and *sickly* fit

For the sound man. *Id. King Lear.*

A pleasing cordial, Buckingham,

Is this thy vow unto my *sickly* heart.

Id. Richard III.

The native hue of resolution

Is *sicklied* o'er with the pale cast of thought.

Shakspeare.

My people are with *sickness* much enfeebled,

My numbers lessened. *Id. Henry V.*

The judges that sat upon the jail, and those that attended, *sickened* upon it and died. *Bacon.*

Where's the stoick can his wrath appease,

To see his country *sick* of Pym's disease?

Cleveland.

Despair

Tended the *sick*, busiest from couch to couch.

Milton.

Merely to drive away the time, he *sickened*,

Fainted, and died; nor would with ale be quickened.

Id.

Next compare the *sickliness*, healthfulness, and fruitfulness of the several years. *Graunt.*

Time seems not now beneath his years to stoop,

Nor do his wings with *sickly* feathers droop.

Dryden.

The ghosts repine at violated night,

And curse the invading sun, and *sicken* at the sight. *Id.*

The moon grows *sickly* at the sight of day,

And early cocks have summoned me away. *Id.*

Would we know what health and ease are worth, let us ask one that is *sickly*, or in pain, and we have the price. *Grew.*

He was not so *sick* of his master as of his work.

L'Estrange.

Why should one earth, one clime, one stream, one breath,

Raise this to strength, and *sicken* that to death?

Prior.

To animate the doubtful fight,

Namur in vain expects that ray;

In vain France hopes the *sickly* light

Should shine near William's fuller day. *Id.*

Nothing makes a more ridiculous figure in a man's life than the disparity we often find in him *sick* and well. *Pope.*

Why will you break the sabbath of my days,

Now *sick* alike of envy and of praise? *Id.*

Abstract what others feel, what others think,

All pleasures *sicken*, and all glories sink. *Id.*

Trust not too much your now resistless charms,

Those age or *sickness* soon or late disarms. *Id.*

There affectation with a *sickly* mien,

Shows in her cheek the roses of eighteen;

Practised to lisp, and hang the head aside,

Faints into airs, and languishes with pride. *Id.*

When on my *sickly* couch I lay,

Impatient both of night and day,

Then Stella ran to my relief. *Swift.*

When I say every *sickness* has a tendency to death, I mean every individual *sickness* as well as every kind. *Watts.*

Your bodies are not only poor and perishing, like your clothes, but, like infected clothes, fill you with all diseases and distempers, which oppress the soul with *sickly* appetites and vain cravings. *Law.*

SICK-BAY, or SICK-BIRTH (Fr. poste aux malades), in line of battle ships, is a place immediately under the forecabin, usually fitted up on the starboard side, and appropriated to the reception of the sick and wounded seamen. It is partitioned off by wooden frames screened with canvas, and may be easily taken down and folded on coming to action. When there is not sufficient room in the sick bay for the patients, other places are fitted up between decks, &c.

The *sick and hurt and transport board for prisoners of war* consists in time of war of six commissioners and a secretary, one of whom is always physician, who are called commissioners of that board. Their duty consists in arranging, in the most advantageous manner, the various departments relating to the prisoners of war in the United Kingdom, with respect to receiving, discharging, exchanging, victualling, and clothing them. It also extends to our naval hospital departments, so far as victualling, clothing, and supplying medicines, necessaries, &c.; and they have the appointment of all officers thereto, except governors, chaplains, physicians, and lieutenants, who are within the patronage of the admiralty board. They appoint first and second lieutenants, stewards, and clerks to prison-ships; also all medical officers to the navy. The medical commissioner has the examining of the surgeons and assistant surgeons, intended for the royal navy, in physic, chemistry, &c., after they have passed Surgeon's Hall; he has also the examination of all the surgeon's journals. The commissioner's power is united in the appointment of all officers within the limits of the board, which has an immediate intercourse with the Admiralty Board.

Regulations for sick and hurt seamen on board our own ships.—In every ship convenient room must be made between decks for the reception of sick and hurt seamen, who are placed under the immediate care of the surgeon, or assistant where no surgeon is allowed, who visits them twice a day, or oftener if occasion requires. The captain is to appoint some of the ship's company, by turns, to serve the sick night and day, and keep the place clean, to be washed with vinegar, and fumigated if the surgeon shall deem it necessary.

By orders from the captain, the cooper may make buckets out of the old staves and hoops; and the carpenter cradles for the use of the sick, and those who have fractured bones. When men are taken ill with infectious fevers, they are to be stripped at their entry into the sick birth, and, if practicable, washed with soap and warm water; their clothes are also to be immersed and washed in boiling water, in order to destroy infection, and the strictest attention must be paid to the cleanliness of the patient. The surgeon is also to direct in regulating the diet of the sick, according to their several symptoms and disorders, restricting salted provisions, and such articles as he may judge improper; in cases where wine is required, he is to apply to the captain, that the purser may supply them with the quantity he shall judge necessary. When fish is caught for the ship's company, he is to give the captain a list of the men who stand

most in need of such refreshment, that they may be the first attended to.

Regulations for sending sick and hurt seamen from their ships for cure.—Sick men are never to be sent to hospitals, neither attending the ship nor on shore, except when their distempers or hurts render it inconvenient to keep them on board their own ships. In that case they must be sent under the charge of an officer and a surgeon's assistant, as the case may require, with their clothes, bedding, and a sick ticket, expressing their names, entry, and number on the ship's books, with a case from the surgeon particularising the previous symptoms and treatment which he or his assistant has experienced and adopted. An officer is never to be sent to an hospital except in cases of urgency, without the approbation of the commander-in-chief, who is to direct the captains to visit the hospitals, and enquire into the conduct of the medical attendants, &c., and to attend to any complaints the patients may have to make. The commander-in-chief, or senior-officer present, must occasionally visit the hospital when other duties will admit of it. The captain is to send an officer on discharging days, to receive such men as are recovered, and to take an account of such as are dead, discharged, &c.

When any are discharged from sick-quarters, and do not return to their ship in twenty-eight days, a D. S. Q. is placed against their names, in order to stop their pay. Captains are to receive such men as the agent of an hospital shall send to them; and if they think them unserviceable, they are to apply for their being surveyed. Slop clothes are not to be issued to any man during his continuance in sick-quarters, unless when it is absolutely necessary, and then they must be entered in the ship's books to be charged against his wages. When ships are in a foreign port where there is not a naval hospital, nor any person appointed by the commissioners for sick and wounded seamen, when necessity requires, the commander-in-chief, senior officer, or captain present, must cause tents to be made for their reception with the old sails of the ship, and appoint the best qualified surgeon in the squadron, &c., to attend them. But, if the raising of tents and the attendance of surgeons be impracticable, the commander-in-chief, &c., may contract with proper persons to supply the sick with lodgings, provisions, &c.; and to appoint some well-qualified medical man or surgeon of the place to attend them, who shall be allowed a specified sum for medicines and attendance. With the sick men are sent the usual sick-tickets, which the surgeon is never to deliver to them, but is to send them to the captain of the ship into which they may be discharged; and he is to receive from the captain a certificate of the day on which the men are sent on board.

SICK-LIST (Fr. *état des malades*), a list containing the names of all those who are unable to do duty in the ship, is daily sent up by the surgeon to the captain, for his inspection and guidance.

SICK'ER, *adj.* Welsh, *siccr*; Belg. *seker*. Sure; certain; firm. Obsolete.

Sicker thou'st but a lazy loord,
And rekes much of thy swink,

That with fond terms and witless words

To bleer mine eyes dost think. *Spenser.*

Being some honest rate or some vicar,
Content with little, in condition sicker.

Hubbard's Tale.

SICK'LE, *n. s.* Sax. *sicol*; Belg. *sickel*, of Lat. *seculæ* or *sicula*. The hook with which corn is cut; a reaping hook.

Their sicklers reap the corn, another sows. *Sandys.*
God's harvest is even ready for the sickle, and all the fields yellow long ago. *Spenser on Ireland.*

You sunburnt sicklemen of August weary,
Come hither from the furrow, and be merry.

Shakespeare.

Time should never,
In life or death their fortunes sever;

But with his rusty sickle mow

Both down together at a blow. *Hudibras.*

O'er whom Time gently shakes his wings of down,
Till with his silent sickle they are mown. *Dryden.*

When corn has once felt the sickle, it has no more benefit from the sunshine. *South's Sermons.*

SICKLE. The same instruments are denominated sickles and hooks. Some of them are also used in one part of the country and some in another.

The common sickle is a sort of semicircular piece of wrought iron faced with steel, which in general is from about twenty to thirty inches in length, and about half an inch in breadth, having a sharp toothed edge cut in the steel part, from twenty-six to thirty teeth being formed in every inch in length. The teeth all incline towards the handle of the tool, so that it only cuts when it is drawn towards the person using it, and not when introduced through the standing corn in the act of reaping. The Furness sickle, a valuable tool of this kind, made use of in a district of that name in the northern part of Lancashire, has a blade two feet six inches long, edged with fifteen teeth in every inch, and in the span of its curvature measures two feet from the heel to the point. It is a powerful tool, and capable of doing much work in a given time when in good hands, as seen below.

The smooth-edged sickle, or reap hook, has a shape and length which are much the same as those in the common sickle, only a little broader; but the edge is smooth or sharp, and without teeth.

The badging or bagging sickle, or hook, is a tool of the same kind, but which is a great deal larger and heavier, as well as broader at the point. It can, however, be used with great effect and expedition by those who are accustomed to this mode of reaping.

The sickle-hook is also another tool of this nature, which is made use of in some districts. It is only toothed from about the middle to the point end, by which the waste of grain in cutting is said to be prevented.

The most ancient of these tools is the common sickle, and it is probably on the whole the best of them, though it is getting much out of use in many parts of the country, being now even scarcely known or employed in the counties of Devon, Cornwall, and Somerset, and many other places in the more western districts of the kingdom, having long since given place to the hooks, the reason of which seems to be the greater ease

of performing the work by them, as is commonly supposed, but by no means proved. The sickle is by far the most frugal and economical tool for accomplishing the work with, as causing the least loss of grain.

SICLOS, a town of Hungary, with a castle on a mountain, in which the emperor Sigismund was imprisoned. In 1543 it was betrayed to the Turks by its commander; but in 1664 it was recovered by the Imperialists. It is sixty-four miles south-east of Comischa.

SICON, a town of Cuba, 125 miles west of Havana.

SICORUS, in ancient geography, a river of Hispania *Tarriconensis*, rising in the Pyrenees. Near it Julius Caesar conquered Afranius and Petreus. See *ROME*. *Lucan* iv. 14, 130. *Plin.* iii. 3. It is now called Segre.

SICULI, an ancient people of Ausonia, who invaded the Sicani in Sicily, and gave their name to the island, about A. A. C. 1059.

SICULUM FALTUM, the ancient name of the Straits of Messina. See *SICILY*.

SICYON, an ancient town of Peloponnesus, the capital of Sicyonia. It was taken by Agamemnon, and afterwards by the Heraclidæ. It became very powerful at the time of the Achaean League, which the citizens joined, at the persuasion of Aratus. The people are said to have been dissolute and luxurious. Sicyonian shoes were deemed marks of effeminacy. It is now called Basilico.

SICYONIA, a kingdom or province of Peloponnesus, on the bay of Corinth, one of the most ancient and eminent in Greece. Egialeus, the son of Phoroneus, was the first king, who began to reign about A. A. C. 2089, and reigned fifty-two years. This country in its flourishing state gave name to all Peloponnesus. It is fertile, and abounds with corn, wine, olive oil, iron, &c.

SICYONIAN. Of or belonging to Sicyon.

SICYOS, in botany, single-seeded cucumber; a genus of plants belonging to the class of monœcia, and to the order of syngenesia; and in the natural system ranged under the thirty-fourth order, cucurbitaceæ. The male flowers have their calyx quinque-dentated, their corolla quinque-partite, and there are three filaments. The female flowers have their calyx and corolla similar; but their style is trifid, and their drupa monospermous. There are three species: 1. *S. angulata*. 2. *S. garcini*, and 3. *S. laciniata*, which are all foreign plants.

SID, a river of England, in Devonshire, which runs into the English channel at Sidmouth.

SIDA, or **SIDE**, in fabulous history, the wife of Orion.

SIDA, yellow, or Indian mallow, in botany, a genus of plants belonging to the class of monadelphica, order polyandria; and in the natural system ranging under the thirty-seventh order, columnifera. The calyx is simple and angulated; the style is divided into many parts; there are several capsules, each containing one seed. There are twenty-seven species;

1. *S. Abutilon*. The Chinese make cords of this plant. It delights in water, and may be advantageously planted in marshes and ditches, where nothing else will grow. From experiments

made by the abbé Cavanilles, a Spaniard, inserted in the *Mém. de l'Acad. Royale*, it appears that the plants succeed best when sown in May, and they arrive at perfection in three months and a half. The maceration of the smaller stalks is finished in about fifteen days; of the larger in a month. The strength and goodness of the thread appeared to be in proportion to the perfection of the vegetation and to the distance the plant was kept at from other plants. The fibres lie in strata, of which there are sometimes six; they are not quite straight, but preserve an undulating direction, so as to form a network in their natural positions. Their smell resembles that of hemp; the fibres are whiter, but more dry and harsh than those of hemp. The harshness is owing to a greenish gluten which connects the fibres; and the white color must be always obtained at the expense of having this kind of thread less supple; when of its natural hue, it is very soft and flexible. This description belongs chiefly to the sida; but it will also apply to the *malva crispa*, *Peruviana*, and *Mauritiana*. See *MALVA*. The *malva crispa* gave, however, the greatest quantity of fibres, and its gluten was most copious. The fibres of the *sida abutilon* and the *malva crispa* are the longest and the strongest; those of the *Peruviana* and *Mauritiana* are the shortest and the weakest. The fibres of those plants which had lost their leaves are less strong, though of equal length with those which had preserved them. 2. *S. Alba*; 3. *Alnifolia*; 4. *Angustifolia*; 5. *Arborea*; 6. *Atrosanguinea*; 7. *Carpæifolia*; 8. *Ciliaris*; 9. *Cordifolia*; 10. *Jamaicensis*; 11. *Paniculata*; 12. *Peripocifolia*; 13. *Retusa*; 14. *Rhombifolia*; 15. *Spinosa*; 16. *Triquetra*; 17. *Viscosa*; 18. *Umbellata*; and 19. *Ureps*. These eighteen species have fifteen capsules each. 20. *S. Americana*; 21. *Asiatica*; 22. *Crispa*; 23. *Crustata*; 24. *Indica*; 25. *Mauritiana*; 26. *Occidentalis*; and 27. *Ternata*. These eight species, with the *Abutilon* above described, are all multicapsular. They are all natives of warm climates; and most of them are found in the East or West Indies.

SIDDEE, or **SEDEL**, an Arabic title, by which the Abyssinians or Habashys are always distinguished in the court of Hindostan; where, being in great repute for firmness and fidelity, they are generally employed as commanders of forts or in posts of great trust.

SID EL COOM, the established legal regicide, or king-killer, in the barbarous kingdom of Senegal. See *SENNAAR*.

SIDDONS, (Mrs.) daughter of Roger Kemble, the manager of an itinerant company of players, was born at Brecknock, in South Wales, in 1755. She commenced her theatrical career as a singer, but soon relinquished that line, and attempted tragedy. In her fifteenth year, she conceived a passion for a young man, who was an actor of all work in her father's company; but her parents considering her too young to form a connexion with him, placed her as lady's maid with a lady in Warwickshire. In her eighteenth year, however, she was married to Siddons, with their consent; and the new-married pair entered into a strolling company. She and her husband played at Liverpool, Birmingham, and other places, gaining both reputa-

tion and profit. *The theatrical character which she had acquired induced the manager of Drury lane to offer an engagement, which she accepted. It was, however, only in secondary parts that she appeared.* But in a short time she quitted the London boards, in consequence of the scurrilous attacks of a disappointed editor of a newspaper, in whose condemned after-piece she had been unluckily enough to perform. Bath was the next scene of her exertions; and, while there, she improved rapidly, and became a general favourite. The duchess of Devonshire, then in the zenith of her charms and influence, became her friend; and, through the intervention of that accomplished lady, she was again engaged at Drury lane. The re-appearance of Mrs. Siddons in London took place on the 10th of October, 1782, in the character of Isabella. Her success was complete. The public were astonished by her powers. She was acknowledged to be the first tragic actress of the English stage, and tragedy became fashionable. The manager gave her an extra benefit, and increased her salary. For that benefit she came forward as Belvidera, and at once exalted her fame, and made a considerable increase to her fortune. Such was the delight which she gave, that the gentlemen of the bar subscribed a hundred guineas as a present to her. She subsequently visited Dublin and Edinburgh with equal applause. In 1784, some calumnies circulated against her, with respect to her conduct towards an unhappy sister, occasioned her to meet with an unkind reception from a London audience, and affected her so much, that she resolved to retire from the stage; but the calumnies were speedily refuted, and her resolution was given up. For more than twenty years she continued to astonish and enchant the lovers of the drama; and she was often invited to Buckingham house and to Windsor to read plays to their majesties. But her readings there were rather productive of honour than of profit. The fortune which she had accumulated was, however, large, and for many years she enjoyed it in the privacy of domestic life. It was not only as an actress that Mrs. Siddons displayed talents. She had considerable merit as a sculptor, in which capacity she produced, amongst other things, a medallion of herself, a bust of her brother, John Philip Kemble, in the character of Coriolanus, a study of Brutus before the death of Cæsar, and a bust of president Adams. The symmetry of her person was captivating. Her face was peculiarly happy, having strength of features, but so well harmonized when quiescent, and so expressive when impassioned, that most people thought her more beautiful than she was. So great, too, was the flexibility of her countenance, that it caught the instantaneous transitions of passion with such variety and effect, as never to fatigue the eye. Her voice was plaintive, yet capable of firmness and exertion. Her eye was large; her brow capable of contracting with disdain or dilating with sympathy or pity; and her articulation clear, penetrating, and distinct. So entirely was she mistress of herself, so collected and so determined in her gestures, tone, and manner, that she seldom erred, like other actors, because she doubted her own

powers of comprehension: she studied her author attentively; she was sparing in action though her acting was the result of the most refined and assiduous attention, no studied trick or start could be predicted; none of those art in which the actress is seen, and not the character, could be found in Mrs. Siddons. What was still more delightful, she was an original; she copied no one, living or dead, but acted from nature and herself. Mrs. Siddons, having acquired an ample fortune, took her leave of the stage, in 1812, before an audience which melted into tears on the occasion. She, however performed in 1816, for the benefit of her brother, Mr. Charles Kemble, and a few nights in Edinburgh, to assist her daughter-in-law. Her greatest characters are well known to have been Catherine, in Henry VIII., and lady Macbeth, in which she manifested a dignity and sensibility rarely equalled. She died June 8th, 1831.—See Boaden's *Memoirs of Mrs. Siddons* (2 vols. 1827.)

SIDE, <i>n. s., adj. & v. n.</i>	Sax. <i>side</i> ; Goth.
SIDEBOARD, <i>n. s.</i>	<i>sijde</i> . The rib part
SIDEBOX,	of an animal; edge;
SIDEFLY,	margin; verge; any
SIDE'LONG, <i>adj. & adv.</i>	part, person, or
SIDE'SADDLE, <i>n. s.</i>	thing placed in op-
SIDE'SMAN,	position, local or
SIDEWAYS, <i>adv.</i>	metaphorical, to
SIDEWISE,	something else, or
SID'LE, <i>v. n.</i>	some other part or

person; faction; party; interest: as an adjective, side means lateral, indirect, oblique; as a verb neuter, to lean on one side; to take or lean to a party; sidely is an insect: sidelong, synonymous with side, as an adjective; in a lateral direction, which also sideways and sidewise mean: to sidle, to go sideways with another body or thing; also to be on the side: the other compounds seem to explain themselves.

Take of the blood, and strike it on the two side posts, and on the upper door post, of the houses.

Exodus xii. 7.

The tables were written on both their sides, on the one side and on the other. *Id. xxxii. 15.*

When two boars with rankling malice meet,
Their gory sides fresh bleeding fiercely fret.

Færie Queene.

They presume that the law doth speak with all indifference, that the law hath no side respect to their persons.

Hooker.

There began a sharp and cruel fight, many being slain and wounded on both sides.

Knolles's History of the Turks.

Vexed are the nobles who have sided
In his behalf.

Shakspeare. Coriolanus.

Their weapons only
Seemed on our side; but for their spirits and souls,
This word rebellion it had froze them up,
As fish are in a pond.

Id. Henry IV.

All rising to great place is by a winding stair;
and if there be factions, it is good to side a man's self whilst rising, and balance himself when placed.

Bacon.

The princes differ and divide,
Some follow law, and some with beauty side.

Granville.

What natural agent could turn them aside, could impel them so strongly with a transverse side blow

against that tremendous weight and rapidity, when whole worlds are a-falling? *Bentley's Sermons.*

He not only gives us the full prospects, but several unexpected peculiarities, and *side views*, unobserved by any painter but Homer.

Pope's Preface to the Iliad.

All *side* in parties, and begin the attack. *Pope.*

He from the taste obscene reclaims our youth,
And sets the passions on the *side* of truth;
Forms the soft bosom with the gentlest art,
And pours each human virtue in the heart. *Id.*

Why round our coaches crowd the white-gloved beaux?

Why bows the *sidebox* from its inmost rows? *Id.*

Those who pretended to be in with the principles upon which her majesty proceeded, either absented themselves where the whole cause depended, or *sided* with the enemy. *Swift.*

My secret enemies could not forbear some expressions, which by a *side* wind reflected on me. *Id.*

The chaffering with dissenters is but like opening a few wickets, and leaving them a-jar, by which no more than one can get in at a time, and that not without stooping and *siding*, and squeezing his body. *Swift.*

Ere the soft fearful people to the flood

Commit their woolly *sides*. *Thomson.*

The kiss snatched hasty from the *sidelong* maid. *Id.*

Two nations still pursued

Peculiar ends, on each *side* resolute

To fly conjunction. *Philips.*

SID'ERAL, *adj.* } Lat. *sidus*, a star. Starry;

SID'ERATED, } astral: siderated is blasted

SIDERA'TION, *n.s.* } (supposed by the stars);
planet-struck: the noun substantive corresponding.

These changes in the heavens, though slow, produced

Like change on sea and land: *sideral* blast,

Vapour and mist, and exhalation hot,

Corrupt and pestilent! *Milton's Paradise Lost.*

Parts cauterized, gangrenated, *siderated*, and mortified, become black; the radical moisture, or vital sulphur, suffering an extinction.

Browne's Vulgar Errors.

The contagious vapor of the very eggs produces a mortification or *sideration* in the parts of plants on which they are laid. *Ray on the Creation.*

The musk gives

Sure hopes of racy wine, and in its youth,

Its tender nonage, loads the spreading boughs

With large and juicy offspring, that defies

The vernal nippings and cold *sideral* blasts. *Philips.*

SIDERATIO. See **NECROSIS**.

SID'ERAL, or **SIDEREAN**, from Latin *sideres*, starry. Of or belonging to the stars; like a star; starry; the same with *sideral*, but more used, as well as *siderial*.

SIDERIA, in the old system of mineralogy, a genus of crystals, used to express those altered in their figure by particles of iron. These are of a rhomboidal figure, and composed only of six planes. Of this genus three species were enumerated: 1. A colorless, pellucid, and thin one; found in considerable quantities among the iron ores of the forest of Dean in Gloucestershire, and in several other places. 2. A dull, thick, and brown one; not uncommon in the same places with the former. And, 3. A black and very glossy kind, a fossil of great beauty; found in the same places, also in Leicestershire and Sussex.

SID'ERIAL, or **SIDEREAL**. See **SIDEREAL**.

SID'ERIAL DAYS. See **ASTRONOMY**, **INDEX**.

SID'ERIAL YEAR. See **ASTRONOMY**, **INDEX**.

SID'ERITIS, iron-wort, in botany, a genus of plants belonging to the class of didynamia, and to the order of gymnospermia; and in the natural system ranging under the forty-second order, verticillatæ. The stamina are within the tube of the corolla. There are two stigmas, one of which is cylindrical and concave; the other, which is lower, is membranous, shorter, and sheathing the other. The species are fifteen. 1. *S. Canariensis*, the Canary iron-wort, is a native of Madeira and the Canary Islands; 2. *S. candicans*, the whitish iron-wort, is also a native of Madeira; 3. *S. ciliata*, the ciliated, or hairy iron-wort; 4. *S. elegans*, the elegant iron-wort; 5. *S. hirsuta*, the rough iron-wort, is indigenous in the south parts of Europe; 6. *S. hyssopifolia*, the hyssop-leaved iron-wort, is a native of Italy and the Pyrennees; 7. *S. incana*, the hoary iron-wort, is a native of Spain; 8. *S. lanata*, the woolly iron-wort; 9. *S. montana*, the mountain iron-wort, is a native of Italy and Austria; 10. *S. perfoliata*, the full-leaved iron-wort, is a native of the Levant; 11. *S. Romana*, the Roman iron-wort, is a native of Italy; 12. *S. scordioides*, the German iron-wort, a native of the south of France; 13. *S. Syriaca*, Syrian iron-wort, a native of the Levant.

SID'EROXYLON, iron-wood, in botany, a genus of plants belonging to the class of pentandria, and to the order of monogynia; and in the natural system ranging under the forty-third order, dumosæ. The corolla is cut into ten parts, the lacinia or segments being incurvated alternately; the stigma is simple; the berry contains five seeds. There are ten species: 1. *S. cymosum*, the sproutful iron-wood, a native of the Cape of Good Hope; 2. *S. decandrum*, the ten-chived iron-wood, has ten stamina; 3. *S. foetidissimum*, the stinking iron-wood, is a native of the Cape of Good Hope; 4. *S. inerme*, smooth iron-wood, in this country requires a warm stove; 5. *S. lycioides*, the willow-leaved iron-wood, is a native of North America; 6. *S. melanophelum*, laurel-leaved iron-wood; 7. *S. mite*, the mild iron-wood, requires a warm stove in this country; 8. *S. siriceum*, silky iron-wood, is a native of New South Wales; 9. *S. spinosum*, thorny iron-wood, or argan, is a native of Morocco; 10. *S. tenax*, silvery-leaved iron-wood, is a native of Carolina. The wood of these trees, being very close and solid, has given occasion for this name to be applied to them, it being so heavy as to sink in water. As they are natives of warm countries, they cannot be preserved in this country unless they are placed in a greenhouse. They are propagated by seeds procured from abroad.

SID'ERUM, the name first given by Sir T. Bergman to the phosphuret of iron, which he took to be a new metal. See **PHOSPHURET**.

SIDLA, **SIDLAW**, or **SIDLEY HILL**, the principal and the highest of the Sidlaw Hills, which gives name to the whole ridge, is 1406 feet above the level of the sea.

SIDLA, **SIDLAW**, **SIDLEY**, or **SUDLAW HILLS**, a ridge of hills of Scotland, extending from west to east, through the counties of Perth and For-

far, commencing at Kinnoul and terminating near Brechin. This ridge stands on the south side of the valley of Strathmore, and is so named from its situation; *sud-laws*, in the Gaelic language, signifying south hills. The mountains are of various heights. Next to Sidlaw, the highest, are King's Seat, Kinpurnie, and Dunsinnan.

SIDMOUTH, a market-town in the hundred of East-Budleigh, Devonshire, situate at the mouth of the small river Sid, near the sea, twelve miles south-east of Exeter, and 158 west by south from London. It was anciently a considerable sea-port, but its harbour has long since been choked with sand. Of late years it has been much frequented as a watering-place, and is much improved. It has an elegant ball-room, and on the beach a commodious tea-room and shade. The town stands between two hills, and although open to the ocean, is entirely free from fogs, so that it is esteemed a very healthy as well as pleasant situation. Markets on Tuesday and Saturday. Fairs Easter Monday and Tuesday, and the third Monday in September. It is a vicarage, value £18. 15s. 5d.

SIDNEY (Sir Philip), was born at Penshurst, in Kent, in 1554; his father was Sir Henry Sidney, an Irish gentleman, and his mother Mary, the eldest daughter of John Dudley, duke of Northumberland. He was sent when very young to Christ-church College at Oxford, but left the university at seventeen to set out on his travels. After visiting France, Germany, Hungary, and Italy, he returned to England in 1575, and was next year sent by queen Elizabeth as her ambassador to Rodolph II. emperor of Germany. On his return he visited Don John of Austria, governor of the Netherlands, and was received with great respect. In 1579, when queen Elizabeth seemed on the point of concluding her long-projected marriage with the duke of Anjou, Sir Philip wrote her a letter, in which he dissuaded her from the match with unusual elegance of expression, as well as force of reasoning. About this time a quarrel with the earl of Oxford occasioned his withdrawing from court; during which retirement he is supposed to have written his celebrated romance, called *Arcadia*, which is so often quoted by Dr. Johnson in his dictionary. In 1585, after the queen's treaty with the United States, he was made governor of Flushing and master of the horse. Here he distinguished himself so much that his reputation rose to the highest pitch. He was named, it is said, by the republic of Poland, as one of the competitors for that crown, and might even have been elected, had it not been for the interference of the queen. But his illustrious career was soon terminated; for in 1586 he was wounded at the battle of Zutphen, and carried to Arnheim, where he soon after died. His body was brought to London, and buried in St. Paul's Cathedral. He is described by the writers of that age as the most perfect model of an accomplished gentleman that could be formed, even by the wanton imagination of poetry or fiction. Virtuous conduct, polite conversation, heroic valor, and elegant erudition, all concurred to render him the ornament and delight of the English court; and, as the credit

which he enjoyed with the queen and the earl of Leicester was wholly employed in the encouragement of genius and literature, his praises have been transmitted with advantage to posterity. No person was so low as not to become an object of his humanity. After the battle of Zutphen, when he was lying on the field, mangled with wounds, a bottle of water was brought him to relieve his thirst; but, observing a soldier near him in a like miserable condition, he said, 'This man's necessity is still greater than mine,' and resigned to him the bottle of water. Besides his *Arcadia*, he wrote several smaller pieces both in prose and verse, which have been published.

SIDNEY (Algernon), the celebrated English patriot, was the second son of Robert earl of Leicester, and Dorothy, eldest daughter of the earl of Northumberland. He was born about 1617. During the civil wars he took part against the king, and distinguished himself as a colonel in the army of the parliament. He was afterwards appointed one of king Charles's judges, but declined appearing in that court. During the usurpation of Cromwell, Sidney, who was a violent republican, retired to the country, and spent his time in writing those discourses on government which have been so deservedly celebrated. After the death of the protector, he again took part in the public transactions of his country, and was abroad on an embassy to Denmark, when king Charles was restored. Upon this he returned to Hamburgh, and afterwards to Frankfurt, where he resided till 1677, when he returned to England, and obtained from the king a pardon. After his return he made repeated attempts to procure a seat in parliament, but all of them proved unsuccessful. After the intention of the commons to seclude the duke of York from the throne had been defeated by the sudden dissolution of parliament, Sidney joined with eagerness the councils of Russel, Essex, and Monmouth, who had resolved to oppose the duke's succession by force of arms. Frequent meetings were held at London; while, at the same time, a set of subordinate conspirators, who were not, however, admitted into their confidence, met and embraced the most desperate resolutions. Keeling, one of these men, discovered the whole conspiracy; and Algernon Sidney, together with his noble associates, was immediately thrown into prison, and no art was left unattempted to involve them in the guilt of the meaner conspirators. Howard, an abandoned nobleman, without a single spark of virtue or honor, was the only witness against Sidney; but, as the law required two, his Discourses on Government, found unpublished in his closet, were construed into treason, and declared equivalent to another witness. It was in vain for Sidney to plead that papers were no legal evidence; that it could not be proved they were written by him; and that, if they were, they contained nothing treasonable. The defence was over-ruled; he was declared guilty, condemned, and executed on the 7th December, 1683. His attainder was reversed in the first year of king William. He was a man of extraordinary courage, steady even to obstinacy; of a sincere but rough and boisterous temper. Though he professed his belief in

the Christian religion, he was an enemy to an established church, and even, according to Burnet, to every kind of public worship. In his principles he was a zealous republican; government was always his favorite study, and his essays on that subject are a proof of the progress which he made.

SIDON, in ancient geography, a city of Phœnicia, in Asia, famous in Scripture for its riches, arising from the extensive commerce carried on by its inhabitants. Heavy judgments were denounced against the Sidonians on account of their wickedness, which were accomplished in the time of Artaxerxes Ochus, king of Persia; for that monarch having come against them with an army, on account of their rebellion, the city was betrayed by its king; upon which the wretched inhabitants were seized with despair; they set fire to their houses, and 40,000, with their wives and children, perished in the flames. This city is now called Saïde; and, according to Bruce's account, not only its harbour is filled up with sand, but the pavement of the ancient city stood seven feet and a half lower than the ground on which the present city stands. Volney describes it as an ill-built dirty city. See SAÏDE.

SIDONIA, an epithet of Dido (Ovid. Met. xiv. 80); also of Carthage, because built by Sidonians.—Virg. Æn. 4, v. 682.

SIDONIAN, of or belonging to Sidon.

SIDONIANS, the people of Sidon. They were extremely ingenious in arts and manufactures, and were particularly famous for embroidery and dyeing.

SIDONIORUM INSULÆ, in ancient geography, islands in the Gulf of Persia.—Strabo, xvi.

SIDONIS, an ancient country of Asia, in the west of Syria, or Phœnicia, on the coast of the Mediterranean. Sidon was the capital.

SIDONIUS, APOLLINARIS. See APOLLINARIS.

SIDRA, an extensive gulf in the eastern part of the territory of Tripoli, in the interior of which are extensive quicksands, celebrated in antiquity under the appellation of Syrtis, from a corruption of which the modern name is derived. It extends from long. 15° 30' to 19° 30' E., and from lat. 30° 30' to 32° 30' N.

SIDUS GEORGII, in astronomy, a name sometimes given to the primary planet, discovered by Dr. Herschell in 1781. By most foreign, and some British philosophers, it is named Herschell. See ASTRONOMY, Index.

SIEGE, *n.s. & v.a.* Fr. *siege*; qu. Lat. *sedis*? The act of besetting a fortified place; a leaguer; a seat; throne; stool; place: to besiege (obsolete).

Drawing to him the eyes of all around,
From lofty siege began these words aloud.

Færie Queene.

Him he had long oppress with tort,

And fast imprisoned in sieged fort. *Id.*

It seemed, by the manner of their proceeding,
that the Turks purposed rather by long *siege* than by
assault to take the town.

Knolles's History of the Turks.

Our castle's strength

Will laugh a *siege* to scorn: here let them lie,
Till famine eat them up. *Shakspeare. Macbeth.*

Beat away the busy meddling fiend,

That lays strong *siege* unto this wretch's soul,

Vol. XX.

And from his bosom purge this black despair.

Id. Henry VI.

Give me so much of your time, in exchange of it,
as to lay an amiable *siege* to the honesty of Ford's
wife. *Shakspeare.*

I fetch my life and being

From men of royal *siege*.

Id. Othello.

Your sum of parts

Did not together pluck such envy from him,

As did that one, and that in my regard

Of the unworthiest *siege*. *Id. Hamlet.*

The more I see

Pleasures about me, so much more I feel

Torment within me, as from the hateful *siege*

Of contraries.

Milton's Paradise Lost.

It entereth not the veins, but taketh leave of the
permeant parts, as the mouths of the meseraicks, and I
accompanieth the inconvertible portion unto the
siege. *Browne's Vulgar Errours.*

Love stood the *siege*, and would not wield his
breast. *Dryden.*

SIEGE. The first operation of a siege, says colonel James, is investing. The body of troops investing a town should at least be as strong again as the garrison; so as to be able to divide itself into several parties, in order to take possession of all the avenues leading to the place. By day they should keep themselves out of cannon-shot; but, as soon as it is dusk, they must approach much nearer, the better to be able to support each other, and to straiten the town.

To undertake the siege of a town (*entreprendre le siège d'une ville* Fr.), to invest it, to form lines of circumvallation, to open trenches, &c.

To lay siege to a town (*faire le siège d'une ville*, Fr.), to draw your forces round a town for the purpose of attacking it.

To carry on a siege (*continuer un siège*, Fr.), to persevere by regular approaches, &c., in gaining ground upon the garrison.

To lay close siege (*presser le siège*, Fr.), to approach close to the walls for the purpose of making a breach and storming, or of starving out the garrison. For a full and scientific explanation of the different methods which are adopted in modern times, for the attack and defence of places, particularly of sieges, see *Essai Général de Fortification et d'attaque et défense des places*, tom. i. page 61, &c. &c.

General phrases and terms used at a siege are, viz.:—*To besiege a place*. See **SIEGE**.

To accelerate the siege (*accélérer siège*, Fr.) is when an army can approach so near the place as the covert-way, without breaking ground, under favor of some hollow roads, rising grounds, or cavities, and there begin their work.

An *attack* is when the besieging army can approach the town so near as to take it, without making any considerable works.

To form the siege, or lay siege to a place (*mettre le siège à une place*, Fr.), there must be an army sufficient to furnish five or six reliefs for the trenches, pioneers, guards, convoys, escorts, &c., and artillery, with all the apparatus thereto belonging; magazines furnished with a sufficient quantity of all kinds of warlike stores; and a general hospital, with physicians, surgeons, medicines, &c.

To raise the siege (*lever le siège*, Fr.) is to give over the attack of a place, quit the works

thrown up against it, and the posts formed about it. If there be no reason to fear a sally from the place, the siege may be raised in the day time. The artillery and ammunition must have a strong rear guard, lest the besieged should attempt to charge the rear: if there be any fear of the enemy in front, this order must be altered discretionally, as safety and the nature of the country will admit.

To turn the siege into a blockade (convertir le siège en blocus, Fr.) is to give over the attack and endeavour to take it by famine; for which purpose all the avenues, gates, and streams, leading into the place, are so well guarded that no succor can get in to its relief.

To insult a work, to attack it in a sudden and unexpected manner, with small arms, or sword in hand.

Surprise, the taking a place by a coup de main, by stratagem, or treason.

To escalate a place, to approach it secretly, then to place ladders against the wall or rampart, for the troops to mount and get into it that way.

To petard a place, privately to approach the gate, and fix a petard to it, so as to break it open for the troops to enter.

Line of circumvallation, a kind of fortification, consisting of a parapet or breast-work, and a ditch before it, to cover the besiegers against any attempt of the enemy in the field.

Line of contravallation, a breast-work, with a ditch before it, to cover the besiegers against any sally from the garrison, in the same manner that the line of circumvallation serves to protect them in the field.

Lines, works made to cover an army, so as to command a part of the country, with a breast-work and ditch before them.

Retrenchment, a work made round the camp of an army, to cover it against any surprise.

Line of counter-approach, a trench which the besieged make from the covert-way to the right and left of the besieger's attacks, in order to scour their works. This line must be perfectly enfiladed from the covert-way and the half moon, &c., that it may be of no service to the enemy, in case he gets possession of it.

Batteries at a siege cannot be erected till the trench is advanced within reach of the cannon of the place; that is, within what is generally understood to be a point-blank range, which is reckoned about 300 toises, 1800 feet.

Cannon is made use of at a siege for two different purposes; the first to drive away the enemy from their defences; and the second to dismount their guns. To produce these two effects, the batteries should not be above the mean reach of cannon shot from the place: therefore there is no possibility of constructing them till the first parallel is formed, as that work is usually traced at 300 toises from the place: therefore the batteries must be on this line, or between it and the town.

The completion of the batteries is in some services left to the officers of the royal artillery, after the engineers have thrown up the mass of cover; but in the British service the engineers finish every part of them. They must be parallel

to the works of the town which they are to batter. It is customary to place the mortar-batteries and gun-batteries side by side, and in the same line, to the end that they may batter the same parts. The use of both is to demolish the enemy's works, to dismount their guns, to penetrate into their powder magazines, and to drive the besieged from their works and defences; as also to ruin and destroy the principal buildings, by setting fire to the town; and to fatigue and distress the inhabitants in such a manner that they shall press the garrison to surrender.

To sally at a siege is to go privately out of a besieged town, fall suddenly upon the besiegers, and destroy part of their works, spike their cannon, and do every other possible damage.

A sally, a secret movement which is made out of a besieged town or place, by a chosen body of troops, for the purpose of destroying an enemy's outworks, &c. Sallies are seldom made when the garrison is weak; for although they molest the enemy, and keep him on the alert, yet the chance of losing men renders it prudent to keep within the works.

Saps *To sap at a siege* is the method of carrying on the approaches when so near the place as to be unable to work without cover. It is performed by men on their knees behind a mantlet or stuffed gabion: they make the sap three feet deep, and three feet six inches wide; then common workmen widen it to the usual size, and it bears the name of trench. There are various sorts of saps, viz.

Single sap, that which is made on one side only, or, which is the same thing, has only one parapet.

Double sap has a parapet on each side, and is carried on wherever its two sides are seen from the place.

Flying sap is that in which the working parties of the besiegers place their gabions themselves, and instantly fill them with earth, and continue to work under their cover: it is made where the workmen are not much exposed, and in order to accelerate the approaches.

Sap-faggots are a kind of fascines, only three feet long, and about six inches in diameter.

Saucissons are another species of fascines, from twelve to nineteen feet long, and from eight to ten inches in diameter, and are used in making batteries, and repairing the breaches.

Sortie. See *Sally*.

Tail, or rear of the trench (queue de la tranchée, Fr.), is the first work the besiegers make when they open the trenches.

Tambour, a kind of traverse, at the upper end of the trench, or opening made in the glacis to communicate with the arrows. This work hinders the besiegers from being masters of the arrow, or discovering the inside of the place of arms belonging to the covert-way.

Traverse in a siege, a kind of retrenchment, which is made in the dry ditch, to defend the passage over it.

Trenches are passages or turnings dug in the earth, in order to approach a place without being seen from its defences.

Woolpacks used in a siege differ from sandbags in this only, that they are much larger, and

instead of earth, they are filled with wool. They are used in making lodgments in places where there is but little earth, and for other similar purposes. They are about five feet high and fifteen inches in diameter.

Rear of an attack is the place where the attack begins.

Front, or head of an attack, that part next to the place

Mantlets are wooden fences, rolling upon wheels, of two feet diameter; the body of the axle-tree is about four or five inches square, and four or five feet long; to which is fixed a pole of eight or ten feet long, by two spars: upon the axle-tree is fixed a wooden parapet, three feet high, made of three-inch planks, and four feet long, joined with dowel-pins, and two cross-bars: this parapet leans somewhat towards the pole, and is supported by a brace, one end of which is fixed to the pole, and the other to the upper part of the parapet. Mantlets are used to cover the sappers in front against musket-shot.

Maxims in sieges, 1. The approaches should be made without being seen from the town, either directly, obliquely, or in flank.

2. No more works should be made than are necessary for approaching the place without being seen; i. e. the besiegers should carry on their approaches the shortest way possible, consistent with being covered against the enemy's fire.

3. All the parts of the trenches should mutually support each other; and those which are farthest advanced should be distant from those that defend them about 120 or 130 toises, that is, within musket-shot.

4. The parallels, or places of arms the most distant from the town, should have a greater extent than those which are the nearest, that the besiegers may be able to take the enemy in flank, should he resolve to attack the nearest parallels.

5. The trench should be opened or begun as near as possible to the place, without exposing the troops too much, in order to accelerate and diminish the operations of the siege.

6. Care should be taken to join the attacks; that is, they should have communications, to the end that they may be able to support each other.

7. Never to advance a work, unless it be well supported; and for this reason, in the interval between the second and third place of arms, the besiegers should make on both sides of the trenches smaller places of arms, extending forty or fifty toises in length, parallel to the others, and constructed in the same manner, which will serve to lodge the soldiers in, who are to protect the works designed to reach the third place of arms.

8. Take care to place the batteries of cannon in the continuation of the faces of the parts attacked, in order to silence their fire; and to the end that the approaches, being protected, may advance with greater safety and expedition.

9. For this reason, the besiegers should always embrace the whole front attacked, in order to have as much space as is requisite to place the batteries on the produced faces of the works attacked.

10. Do not begin the attack with works that lie close to one another, or with reentrant angles, which would expose the attack to the cross-fire of the enemy.

Stores required for a month's siege are nearly as follow:—

	lbs.
Powder, as the garrison is	
more or less strong	300,000 or 900,000
Shot { for battering pieces	6000
{ of a lesser sort	20,000
Battering cannon	80
Cannons of a lesser sort	40
Small field pieces for defending the lines	20
Mortars for throwing { shells	24
{ stones	12
Shells for mortars	15,000 or 16,000
Hand-grenades	40,000
Lead bullets	180,000
Matches in braces	10,000
Flints for muskets, best sort	100,000
Platforms complete for guns	100
Platforms for mortars	60
Spare { carriages for guns	60
{ mortar beds	60
{ sponges, rammers, and ladles, in sets	20
Tools to work in trenches	40,000

Several hand-jacks, gins, sling-carts, travelling forges, and other engines proper to raise and carry heavy burdens; spare timber, and all sorts of miners' tools, mantlets, stuffed gabions, fascines, pickets, and gabions.

Siege brusqué, Fr., an expression used among the French to signify the prompt and immediate movement of a besieging army, against a fortified town or place, without waiting for the regular formation of lines, &c. In this case the troops make a vigorous attack upon all the outworks, and endeavour to make a lodgment upon the counterscarp. When they have succeeded, they instantly throw up temporary lines, &c., behind them, in order to secure a retreat, should the garrison force them to quit their ground.

The following are some of the most important sieges from the twelfth century to the year 1815.

Acre, 1192; 1799, by Buonaparte.—The siege raised after sixty days' open trenches.

Agria, 1566, 1687.

Aiguillon, 1345.

Alba Regalis (Stulweissenberg), 1543, 1601, 1602, 1688.

Alcantara, 1706.

Alessandria (Italy), 1801.

Algiers, besieged by an armament from Charles V. of Spain, in 1541.—Bombarded by order of Louis XIV., in 1682, on which occasion bomb vessels were first employed by a French engineer of the name of Renau.—Bombarded again in 1683; again in 1689, by the French; and finally by lord Exmouth on the 27th day of August, 1816.

Algesiras, 1341.

Alhama, 1481.

Alkmaar, 1573.

Almeida, August 27th, 1810.—Lost by the accidental explosion of the principal magazine, and the after-treachery of major Jose de Barreiros, the Portuguese artillery commander.

- Amiens, 1597.
 Ancona, 1799.
 Angely (St. Jean d'), 1569, 1621.
 Angoulême, 1345.
 Antequera, 1410.
 Antwerp, 1576, 1583; 1585, use of infernal machines; 1706, 1792, 1814.
 Aretino, 1800.
 Arras, 1414.
 Arisch (El), 1800.
 Astorga, April 12th, 1810.
 Azoff, 1736.
 Asti, 1745, 1746.
 Atella, 1496.
 Ath, 1697, 1700; 1745.—First general adoption of firing with artillery à ricochet, at a siege.
 Avignon, 1226.
 Badajoz, March 11th, 1811; besieged by lord Wellington in May, the siege raised; a second time during May and June, again raised June 9th, from an insufficiency of means; besieged by his lordship, the third time, in 1812, and taken by escalade on the night of April 6th. If the British had failed, in this last attempt, the army must have gone back to the lines of Torres Vedras.—*Remark*.—After twenty days' open trenches, three breaches were made; the assault of these failed, while an attack of the same walls by escalade succeeded.—Such were the exertions, and so daring was the intrepidity of the British troops during the escalade, particularly that made by general Leith, and the late lamented Sir Thomas Picton, K. B., that a few years hence they will scarcely obtain belief.
 Bagdad, 1248.
 Barcelona, 1697, 1705, 1706, 1714.
 Bastia, 1511, 1793.
 Bayonne, 1451.
 Beauvais, 1472.
 Belgrade, 1439, 1455, 1521, 1688, 1690, 1717, 1739, 1789.
 Bellegarde, 1793, 1794.
 Belle-Isle, April 7th, 1761.
 Belvedere (Calabria), 1289.
 Bene, 1551, 1795.
 Bergerac, 1345.
 Bergen-op-zoom, 1588, 1622, 1747, 1814.—During one of the most obstinate sieges against this strong place, the Dutch, from the prevalence of a thirst for lucre, actually sold gunpowder and other materials to enable the enemy to destroy their own property.
 Berwick, 1293.
 Besançon, 1668, 1674.
 Bethune, 1710.
 Blisecastel, 1674, 1794.
 Bois-le-duc, 1603, 1629, 1794.
 Bologna, 1512, 1796.
 Bommel, 1599, invention of the covert-way; 1794.
 Bonifacio, 1553.
 Bonn, 1587, 1689, 1703.
 Bordeaux, 1451, 1452, 1653.
 Bouchain, 1676; 1711,—last siege of the duke of Marlborough.
 Boulogne, 1545.
 Bourbon (Ft.), Martinique, 1794; 18—Taken and blown up.
 Bourges, 1412.
 Braunau, 1744, 1805.
 Breda, 1590, 1625, 1793, 1794.
 Brescia, 1439, 1512, 1796, 1799.
 Breslaw, 1741, 1757, 1759; January 8th, 1807.
 Brest, 1373.
 Brieg, 1741, 1806, 1807.
 Brisac, 1638, 1703, 1704.
 Brussels (bombardment), 1695, 1746.
 Buda, 1526, 1528, 1541, 1684, 1686.
 Burgos (Castle of), September 19th, to October 22d, 1812.—The siege of this insignificant place was raised from the want of sufficient means of attack—there not being a miner, a sapper, hardly an artificer in the attacking party.—The fortifications were blown up by the French in 1813, in their retreat, June 13th.
 Cadiz, February 10th, 1810, raised August 12th, 1812, in consequence of the defeat of Marmont at the battle of Salamanca.
 Caen, 1346, 1450.
 Calais, 1347, starved into a surrender by Edward III.; 1436, 1558, 1596.
 Calvi (Corsica), 1794.
 Campo-Mayor, March 23d, 1811; April 15th.
 Candia, 1667 to 1669.—The largest cannon at that time known in Europe cast by the Turks in their camp.—Parallels to support the approaches, invented by an Italian engineer, first used.
 Capua, 1501.
 Carignan, 1544.
 Carthagenia, 1706.
 Casal, 1534, 1629, 1630.
 Cassel, 1328.
 Cassel (Hesse), 1761.
 Castillon, 1452, 1586.
 Ceuta, 1790.
 Chalus, 1199.—Death of Richard Cœur-de-Lion.
 Charleroi, 1672, 1677, 1693, 1736, 1794.
 Chartres, 1568, 1591.
 Château-gaillard, 1203, 1418.
 Chaves, March 25th, 1809.
 Cherbourg, 1450.
 Chincilla, October 30th, 1812.
 Chio, 1346.
 Ciudad Rodrigo, 1706; July 10th, 1810; January 19th, 1812.
 Colberg, 1760, 1761, 1807.
 Colchester, 1645.
 Colliouri, 1794.
 Compiègne, 1430.—Joan of Arc taken prisoner.
 Condé, 1676, 1792, 1794.
 Coni 1691, 1744.
 Constantinople, 1453.
 Copenhagen, 1700, 1801; September 1807.
 Corbeil, 1590.
 Corfu, 1715.
 Courtrai, taken and re-taken twenty times, from 1302 to 1800.
 Cracow, 1772.
 Cremona, 1702.—Surprised by prince Eugene, who carried off marshal Villeroy prisoner; but was finally driven out of the town, after a combat of several hours.
 Crèvecœur, 1672, 1794.
 Croye, 1442 to 1467.
 Damien (St.), 1617.

- Dantzic, 1734, 1793, 1807; 1813 to January 12th, 1814.
- Denia, 1707.—The siege raised by the marquis d'Asfeld, to prevent the entire destruction of his army, after having given three general assaults.
- Dewinter, 1591.
- Dinant, 1466, 1674.
- Diu, 1538, 1546.
- Dole, 1479, 1636; 1668 completed the conquest of Franche Comté; 1674.
- Domingo (St.), 1805.
- Douai, 1710.
- Dover, 1216.
- Dresden, 1745, 1760, 1814.
- Dunmonde, 1710.
- Dunkirk, 1646, 1793.
- Duren, 1543.
- Egra, 1742, 1743.
- Elmo (St.), 1793.
- Epernay, 1592.
- Erie (North America), August 12th, 1814.
- Esseck, 1690.
- Faria, 1373.
- Figueras, August 19th, 1811.
- Flushing, August 15th, 1809, taken by the British.
- Fontenay, 1242, demolished.
- Fossano, 1536.
- Frederickshall, December 1718.—Charles XII. killed.
- Frederickstein, August 13th, 1814.
- Furnes, 1675, 1744, 1793.
- Gaeta, 1433, 1707, 1734, 1799: July, 1806; 1815.
- Gavi, 1625.
- Genoa, 1747, 1800.
- Gerona, December 10th, 1809.
- Gertruidenberg, 1593, 1793, 1795.
- Ghent, 1576; 1708. A French garrison of thirty-seven battalions surrendered to the duke of Marlborough in four days open trenches and previous to the first batteries being completed: had the place resisted till the following day, in all probability the siege would have been raised, in consequence of the intense cold which set in the night of the capitulation. 1745, 1789.
- Gibraltar, 1704, 1779; September, 1782.
- Giorgewo, 1790, 1807.

 Prague, 1741, 1743, 1744.
 Quesnoy (le), 1712, 1794.
 Randan, 1380.
 Rees, 1599.
 Rennes, 1357.
 Retiro (Madrid), August 14th, 1812.
 Rheims, 1359.
 Rhodes, besieged three times, the last in 1522.
 Riga, 1700, 1710.
 Rochelle, 1372, 1573, 1627.
 Rome, 1527, 1798.
 Romorantin, 1356.—Artillery first used in sieges.
 Rouda, 1485.
 Rosas, 1645, 1795, 1808.
 Rotweil, 1640.
 Rouen, 1204, 1419, 1449, 1562, 1591.
 Royan, 1621.
 Salamanca (forts of—St. Vicente, Gayetano, Merced), June 27th, 1812.
 Salisbury, 1349.
 Saragossa, 1710; 1808, four months; February 21st, 1809, taken after fifty-two days open trenches, twenty-nine of which the enemy were in the streets.
 Saverne, 1675.
 Sbaras, 1676.
 Schweidnitz, 1762, the first experiment to reduce a fortress by springing globes of compression; 1807.
 Schonoven, 1575.
 Sebastian (St.), next to Gibraltar, the strongest place in Spain, 1719; September 8th, 1814, most obstinately defended by the French; till general Graham directed the guns to be fired against the curtain, over the men's heads as they advanced to the breach.
 Serezanella, a town in Tuscany, 1487; the first mines, since the invention of gunpowder, were made at the siege of this place, by the Genoese.
 Seringapatam, 1799.
 Seville, 1096, 1248.
 Skid, 1678.
 Sienna, 1544.
 Sigeth, 1566.
 Silberberg, 1807.
 Sluys, 1587, 1604, 1757, 1794.
 Smolensko, 1611.
 Soissons, 1414.
 Stralsund, 1675, the method of throwing red-hot balls first practised with certainty; 1713, 1807.
 Straubing, 1742.
 St. Philip (Fort), in Minorca, 1756; 1782; the garrison nearly destroyed from being lodged in damp casemates, and the defence very much abridged thereby. *.
 Tarifa, 1292; December 20th, 1811.
 Tarragona, June 28th, 1811, stormed by the French—man, woman, and child put to the sword.—May, 1813, besieged by Sir John Murray,—siege raised.
 Temeswar, 1716.
 Terremonde, 1584.

 Vachtendonck, 1588.
 Valencia, 1098, 1238; December 25th, 1811.
 Valencia (of Alcantara), 1705.
 Valencia (New, Spanish America), August 18th, 1811, surrendered to Miranda.
 Valenciennes, 1557, 1677; 1794, taken by the allied army under the command of H. R. L. the duke of York.
 Valognes, 1364.

Vannes, 1343.
 Velez, 1487.
 Venloo, 1702, first siege undertaken by the duke of Marlborough; 1794.
 Verceil, 1617, 1704.
 Verdun, 1792.
 Vienna, 1529, 1683.
 Vintimiglia, 1746.
 Wakefield, 1460.
 Walcheren (Island of), taken by the British. See Flushing.
 Woygnaff, 1676.
 Xativa, 1707; a most memorable defence made by the inhabitants, assisted by a garrison of 600 English troops: as a punishment, the whole town, with the exception of the principal church, was razed, and its name changed to St. Philippe.
 Xeres, 1262.
 Ypres, 1584, 1648, 1744, 1794.
 Ziriczee, 1576.
 Zurich, 1544.
 Zutphen, 1572, 1586.

SIENITE or **SYENITE**, in mineralogy, a compound granular aggregated rock, composed of felspar and hornblende, and sometimes quartz and black mica. The hornblende is the characteristic ingredient, and distinguishes it perfectly from granite, with which it is often confounded; but the felspar, which is almost always red, and seldom inclines to green, forms the most abundant and essential ingredient of the rock. Some varieties contain a very considerable portion of quartz and mica, but little hornblende. This is particularly the case with the Egyptian varieties, and hence these are often confounded with real granite. As it has many points of agreement with greenstone, it is necessary to compare them together. In greenstone the hornblende is usually the predominating ingredient; in sienite on the contrary it is the felspar that predominates. In greenstone the felspar is almost always green or greenish; here on the contrary it is as constantly red or reddish. Quartz and mica are very rare in greenstone, and in inconsiderable quantity; whereas they are rather frequent in sienite. Lastly, greenstone commonly contains iron pyrites, which never occurs in sienite.

It has either a simple granular base, or it is granular porphyritic; and then it is denominated porphyritic sienite. When the parts of the granular base are so minute as to be distinguished with difficulty, and it contains imbedded in it large crystals of felspar, the rock is termed sienite-porphry. It is sometimes unstratified, sometimes very distinctly stratified. It sometimes shows a tendency to the columnar structure. It contains no foreign beds. It occurs in unconformable and overlying stratification, over granite, gneiss, mica-slate and clay-slate, and is pretty continuous, and covers most of the primitive rocks. It is equally metalliferous with porphyry. In the island of Cyprus it affords much copper; many of the important silver and gold mines in Hungary are situated in it. The sienite of the forest of Thuringia affords iron. In this country there is a fine example of sienite in Galloway, where it forms a considerable portion

of the hill called Criffle. On the continent it occurs in the electorate of Saxony; and in Upper Egypt at the city of Syena, in Thebaid, at the cataracts of the Nile, whence it derives its name. The Romans brought it from that place to Rome, for architectural and statuary purposes.

SIENNA, **TERRITORIO DI SIENNA**, or **SIENNESE**, a province of Tuscany, bounded by the Florentine and the territory of Pisa; sixty-two miles in length, and of nearly an equal breadth; its superficial extent is about 3100 square miles. It is divided into two districts, called Upper and Lower; the former enjoying a pure and healthy atmosphere, the latter marshy, and much affected with the mal aria. This province contains level tracts of great fertility, and several of its mountains yield mineral products. Population 190,000.

SIENNA, or **SIENA**, an ancient and considerable city of Tuscany, the capital of the above province, situated in a pleasant and healthy district, on three eminences. Population 24,000. The approach on the southern road is through a fine avenue planted with trees, and affording, from a distance, too favorable a view of the town, of which the streets are extremely uneven, winding, and narrow, so that for the chief part they are impassable for carriages. The streets are paved with brick. The only handsome square is that in which is the town-house; it contains a beautiful fountain. The piazza here is one of the principal attractions: it is a large space, well laid out with walks, and planted with statues. The esplanade is a fine shady avenue leading to the citadel, the ramparts of which, planted with trees, and laid out in the form of terraces, afford several interesting views.

The cathedral of Sienna is a marble Gothic structure, accounted inferior to none in Italy, except St. Peter's. Its nave is supported by beautiful columns; its pavement embellished with mosaics, and with delineations of sacred subjects. Several of the chapels and altars are deserving of minute attention. The town-house is a large building, also in the Gothic style, and surrounded with porticoes. Adjoining is the theatre, rebuilt since 1750. There are also in Sienna several fine family mansions, or palaces, as they are termed.

The manufactures include woollen, leather, paper, and hats, but all on a small scale. Some traffic is carried on in corn, and in the valuable marble of the environs. The town is the seat of a university, founded in 1321, and still reckoning so many as sixty professors; but it is of little repute. The academies of physics and natural history have acquired some note from their memoirs. The Siennese lay claim to a reputation for politeness, to a taste in learning and the arts, and in particular to speaking Italian with great purity. This town has, from first to last, supplied seven popes; it gave birth also to Socinus.

Sienna was long a petty place. Augustus sent thither a colony, and Pliny mentions the town under the name of Colonia Senensis. Its prosperity was greatest during the middle ages, when it enjoyed an extensive commerce. It even long maintained itself as an independent republic; but, intestine divisions favoring the

designs of foreign powers, it became successively subject to French and Spanish invaders; and, in the latter part of the sixteenth century, was ceded to Florence by Philip II. of Spain. Since then it has had no separate government. It is the see of an archbishop, and is thirty miles south by east of Florence.

SIERRA LEONA, a country of western Africa, on the Atlantic, and distinguished for the colony formed there by the British nation from the most laudable motives of generosity and philanthropy. It is traversed by a considerable river, derived from an unknown source in the interior, called the Mitomba or Sierra Leona. The extent to which this last name may be applied, either to the north or south of the river, or in the interior, is very indefinite. The name is derived from a long ridge of mountains rising at no great distance from the southern bank of the river. From these descend many streams or torrents, a number of which unite, in a place called the bay of France, into a large basin, which affords the best watering-place in all Guinea. This is described as a most delightful spot, shadowed by tall trees, mingled with rocks. The country consists generally of one vast, almost impenetrable forest, only particular spots of which have been cleared and cultivated. Even at a few steps from the shores and villages the ground becomes encumbered with trees and shrubs, penetrated only by narrow paths formed by the natives to their cleared fields. The houses are low, little huts, built with wooden posts fastened in the ground, of a round or square form, and thatched with straw. The villages consist of thirty or forty of such huts, and are moved without the least difficulty from place to place as convenience or fancy direct. Rice is raised wherever the ground is sufficiently watered for its production, and forms the constant food of the rich; but the poor content themselves with millet, yams, and plantains. There is great abundance of fruits. The pine-apple is pre-eminent; to which are added oranges, lemons, limes, and a fruit resembling a melon. The palm tree yields a liquor which is eagerly drank, and possesses intoxicating qualities. Elephants' teeth brought to the coast here are valued above any other on the same coast, being remarkably clean, white, and free from specks, though they occur elsewhere of larger size. A considerable quantity of civet is brought to market, the produce of a peculiar species of cat. The woods and mountains are considerably infested with wild animals, particularly lions, from the multitude of which the country appears to have derived its name. Apes, also, move about in vast bodies. The exuberance of life in a tropical climate gives rise also to numerous and troublesome swarms of insects, flies, mosquitoes, and particularly ants, the white species of which commit extraordinary devastation. The same cause multiplies the serpent species to a remarkable degree. The rivers contain large alligators, and the manatee or sea cow.

The Portuguese were the first who formed settlements in the river of Sierra Leona; but afterwards all the nations of Europe found their way thither. The English established their fac-

tory upon Bance Island, situated in the middle of the river, being merely a rock ascended by steps, and possessing no advantage except that of security. The fort was substantially built of stone and lime, defended by ten or twelve guns, and garrisoned by about twenty whites and thirty grumettas or free negroes. The main object of this, as of every other establishment on the same coast, was that which it has since been made so active an instrument in overthrowing, the slave trade; and the supply here afforded, of these unfortunate victims of European cupidity, was very considerable.

SIERRA LEONA, or LEONE, mountains of Africa, between Nigritia and Guinea, extending as far as Abyssinia. See MOUNTAIN. Sierra Leona, being thinly inhabited, appeared to some benevolent gentlemen in England a place where, without incommoding the natives, a sufficient quantity of ground might be bought, on which to settle a great number of free negroes, who, in 1786, swarmed in London in idleness and want. About 400 of these, with sixty whites, mostly women of bad character and in ill health, were accordingly sent out, at the charge of government, to Sierra Leona. Necessity, it was hoped, would make them industrious and orderly; and captain Thomson of the navy, who conducted them, obtained for their use a grant of land to his majesty from king Tom, the neighbouring chief, and afterwards from Naimbanna, the king of the country. The colony, however, soon went to ruin; but the land which they occupied, being about twenty miles square, his majesty was enabled to grant it, by act of parliament, to another colony, founded on better principles, and for a still nobler purpose. The most intelligent members of that society, which has labored so strenuously to procure an abolition of the slave trade, justly concluding that the natives of Guinea would reap very little benefit from the attainment of their object, unless they should be taught the principles of religion and the arts of civil life, which alone can render them really free, conceived the plan of a colony at Sierra Leona, to be settled for the truly generous purpose of civilising the Africans, by maintaining with them a friendly intercourse, and a commerce in every thing but men. This plan could not be carried into effect but at a very great expense. Subscriptions were therefore opened upon rational and equitable terms, and a sum deemed sufficient was speedily raised. An act of parliament was passed in favour of the subscribers, by which they were incorporated by the denomination of the Sierra Leona Company; and in pursuance of that act they held their first meeting at London on the 19th of October, 1791, when the following gentlemen were chosen directors for that year:—Henry Thornton, esq., M. P., chairman; Philip Sansom, esq., deputy chairman; Sir Charles Middleton, bart.; Sir George Young, knt.; William Wilberforce, esq., M. P.; Rev. Thomas Clarkson, A. M.; Joseph Hardesty, esq.; John Kingston, esq.; Samuel Parker, esq.; Granville Sharp, esq.; William Sandford, esq.; Vickeris Taylor, esq.; George Wolfe, esq. The directors having stated the natural advantages of Sierra Leona, and its present miserable condition, ob-

served that they had not merely to establish a commercial factory, but that, to introduce civilisation, cultivation, and a safe trade, the company must provide for the security of the persons and property of the colonists. The directors therefore resolved that three or four vessels should sail at once, with such a number of people as would be able to protect and assist each other; with goods both for trade and for the supply of the colony. Accordingly several vessels sailed, having on board a council for the government of the colony and the management of the company's affairs; a number of artificers and other servants of the company, some soldiers, and a very few English settlers. The directors were laudably cautious in the choice of colonists. They admitted into the society no white man of bad character, or who was not a declared enemy to the slave trade; and, as the chief object of their enterprise was the civilisation of the natives, it was with great propriety that they chose more than three-fourths of their settlers from the free negroes in Nova Scotia, who had borne arms for the British government during the American war. The superintendant and council were particularly instructed to secure to all blacks and people of color at Sierra Leona equal rights and equal treatment, in all respects, with whites. They were to be tried by jury, as well as others; and the council was desired to allot to the blacks, employments suited to their abilities, and to afford them every opportunity of cultivating their talents. All practicable means of maintaining subordination were directed to be used; and the council was especially instructed to promote religion and morals, by supporting public worship and the due observance of the Sabbath, and by the instruction of the people, and the education of children. But no person was to be prevented from performing or attending religious worship, in whatever place, time, or manner, he might think fit, or from peaceably inculcating his own religious opinions. Orders were given in choosing the site of a town to consider health as the first object; and the first town was directed to be called Free Town. Articles for building and cultivation were sent out, besides the cargoes for prosecuting the company's commerce; and schools for reading, writing, and accounts, were ordered to be set up for the purpose of instructing the children of such natives as should be willing to put them under the company's care. The leading object of the company was to substitute for that disgraceful traffic, which has too long subsisted, a fair commerce with Africa, and all the blessings which might be expected to attend it. Considerable advantages appeared hereby likely to result to Great Britain, not only from our obtaining several commodities cheaper, but also from opening a market for British manufactures. From this connexion Africa was likely to derive the still more important benefits of religion, morality, and civilisation.

To accomplish these purposes, it was necessary for the company to possess a tract of land as a repository for their goods, and which the Africans might cultivate in peace, secure from the ravages of the slave trade. It had been ascertained, beyond a doubt, that the climate and soil of Africa

were admirably suited to the growth of sugar spices, coffee, cotton, indigo, rice, and every other species of tropical produce. The company proposed to instruct the natives to raise these articles, and to set them the example, by a spirited cultivation on its own account. Directions were given to the company's commercial agent to push forward a trade, in a mode prescribed, in the present produce of Africa. Measures were taken for cultivating, on the company's account, the most profitable tropical produce; and, in particular, a person of long experience in the West Indies was ordered to begin a sugar plantation. A mineralogist and botanist were likewise engaged to go out and explore the country for new articles of commerce. Every thing being thus settled, upon the most equitable and benevolent principles, the ships sailed with the British colonists, to whom, in March 1792, were added 1131 blacks from Nova Scotia. The native chiefs being reconciled to the plan, and made to understand its beneficent tendency towards their people, the colony proceeded to build Free Town, on a dry and rather elevated spot on the south banks of the river. It occupied between seventy and eighty acres, its length being about one-third of a mile, and its breadth nearly the same; and it contained nearly 400 houses, each having one-twelfth of an acre annexed, on which a few vegetables were raised. There were nine streets running from north-west to south-east, and three cross streets, all eighty feet wide, except one of 160 feet, in the middle of which were all the public buildings. These consisted of a governor's house and offices; a large storehouse; a large hospital; six or eight other houses, offices, and shops, occupied by the company's servants; and a church capable of containing 800 people. The colonists at first suffered much from the rainy season, against which it was not in their power to provide sufficient protection; but at the end of it they recovered in a great measure their health and spirits, and proceeded with alacrity to execute the various purposes of their settlement. To excite emulation in culture, the government gave premiums to those colonists who raised the greatest quantities of rice, yams, eddoes, cabbages, Indian corn, and cotton, respectively. To limit the excesses of the slave trade, and gain the favor of the neighbouring chiefs, the directors instructed the governor and council to redeem any native from the neighbourhood, who should be unjustly sold either to or by a British subject. The servants of the company conducted themselves with the utmost propriety, being sober, moral, and exemplary; and from the labors of the clergymen were derived services highly important in every point of view. Before the end of two years from the institution of the colony, order and industry had begun to show their effects in an increasing prosperity. The woods had been cut down to the distance of about three English miles all round the town. By these means the climate had become healthier, and sickness had greatly abated. The fame of the colony had spread not only along the whole western coast of Africa, but also to parts far distant from the coast; embassies had been received of the most

friendly nature from kings and princes several hundred miles distant; and the native chiefs had begun to send their children to the colony, with full confidence, to be taught reading, writing, and accounts, and to be brought up in the Christian religion. In a word, it was not without grounds that the directors looked forward to that joyful period when, by the influence of the company's measures, the continent of Africa should be rescued from her present state of darkness and misery, and exhibit a delightful scene of light and knowledge, of civilisation and order, of peaceful industry and domestic comfort. On their beneficent exertions they hoped with confidence for the blessing of providence; they were countenanced and supported by the British government; and, upon the breaking out of the present war, the French Convention authorised one of their agents to write to the directors, requesting a full account of the design of the institution, and the names of the ships employed in the service, and assuring them of the good wishes of the French government to so noble an undertaking. How completely that government fulfilled its promise is very generally known. Having vindicated the rights of man in Europe by the violation of every principle of truth and justice, they determined by the same means to give light and liberty to the Africans; and that they have fully carried their determination into effect will be seen by the following extract of a letter from Mr. Afzelius, the company's botanist, dated Sierra Leona, 15th of November, 1794:—

‘The French have been here and ruined us. They arrived on the 28th of September last, early in the morning, with a fleet consisting of one large ship, two frigates, two armed brigs, and one cutter, together with two large armed merchant ships, taken by them at the Isle de Los, an English slave factory to the north of our colony, and which they have also destroyed and burnt. So well had they concealed their nation, that we took them at first for English. They had English-built vessels, which were rigged in the English way. They showed the English flag, and had their sailors, at least those we saw on deck, dressed like English. In short, we did not perceive our mistake till we observed them pointing their guns. We had not strength sufficient to resist, and therefore our governor gave orders that, as soon as they should begin to fire, the British flag should be struck, and a flag of truce hoisted. Accordingly this was done, but still they continued firing, and did much damage, both within and without the town. They killed two people and wounded three or four. But, as we did not understand the meaning of this proceeding, we asked them for an explanation; and they answered us that we should display the flag of liberty as a proof of our submission. We assured them that it should already have been done if we had had any, which terminated the hostilities from the ships. In the mean time, most of the inhabitants had fled from the town, having taken with them as much of their property as they conveniently could in such a hurry. I was with the governor, together with a number of others; but, as soon as I was certain they were enemies, I went towards my own house with a

view to save as much as possible of my property and natural collections; but was received in such a manner that I could not venture to proceed. My house was situated near the shore, and unfortunately just opposite the frigate which fired. I saw the balls passing through the house, and heard them whizzing about my ears. I saw that I should lose all my property; but life was dearer to me, and I hastened to the woods. In the afternoon the enemy landed, finding the town almost destitute of people, but rich in provisions, clothing, and other stores. They began immediately to break open the houses and to plunder. What they did not want they destroyed, burnt, or threw into the river. They killed all the cattle and animals they found in the fields or streets, yards, or elsewhere, not sparing even asses, dogs, and cats. These proceedings they continued the whole succeeding week, till they had entirely ruined our beautiful and prospering colony; and, when they found nothing more worth plundering, they set fire to the public buildings and all the houses belonging to the Europeans; and burnt, as they said, by mistake nine or ten houses of the colonists. At last, after inflicting on us every hardship we could suffer, only sparing our lives and the houses of the colonists, they sailed on the 13th of October last, at noon, proceeding downwards to the Gold Coast, and left us in the most dreadful situation, without provisions, medicines, clothes, houses, or furniture, &c. &c., and I fear much that most of us should have perished had not our friends in the neighbourhood, both natives and Europeans, who were so happy as to escape the enemy, been so kind as to send us what they could spare. In the mean time most of us have either been, or still are, very sick, and many have died for want of proper food and medicine. The worst, however, is now past. At least we are not in any want of provision, although of the coarsest kind, but are destitute of the most necessary articles and utensils for the house, the table, and the kitchen. It was thus that the French Convention executed their purpose of spreading light and liberty through the world. The Sierra Leona colony was established for no other end than to abolish the slave trade, to enlighten the Africans, and to render them virtuous, rational, free, and happy; and those powerful patrons of the rights of man destroyed that colony with many circumstances of the most wanton cruelty.

Even this disaster was repaired by the active exertions of the company; the settlement resumed its prosperity, extended its survey over the neighbouring coasts, and received embassies even from remote African states. The company, however, exhausted by its losses, and by that profusion to which such establishments are liable, finally found it expedient to make an arrangement with government, by which Sierra Leona was placed under its immediate jurisdiction, like other colonies. About the same time the African Institution was set on foot by a number of excellent and distinguished individuals, for the purpose of devoting their efforts to the general improvement of this great continent. Sierra Leona appeared the most advantageous centre from which their efforts might emanate; and it

was therefore placed under their entire management. The character of the members was a sufficient pledge for the purity of that zeal with which they would pursue every object tending to the improvement of the colony, and the general benefit of Africa. This is, moreover, fully evinced in the successive reports which they have published on the subject. Yet in these they candidly admit the obstacles which have obstructed the full accomplishment of the objects in view. The volatile and turbulent disposition of the native powers renders them always prompt to take offence, and to embark in hostilities; and this unfriendly disposition is increased by the abolition of the slave trade, to which they were accustomed to look as the chief means of purchasing European luxuries. It has thus been found impossible to avoid repeated ruptures, the effects of which were always pernicious to the interests of the colony. One mode of recruiting its numbers was derived from the negroes captured on their way to the West Indies, by the vessels destined to put a stop to the slave trade; but the disposal of these was attended with considerable difficulty. The first plan was to make them purchase their liberty by a temporary bondage, under the name of indenture; but it was naturally objected that this was running into the very evil which the colony was established to prevent; and the practice has been properly discontinued. Still, to preserve the requisite order and propriety among such a motley population left at full liberty, has not been found an easy task. The introduction of the forms of English law, a measure in itself so salutary, seems to have produced rather injurious effects upon this African race. It has inspired them with an unbounded rage for litigation, and called forth innumerable petty suits for assault and defamation, in which it appears that the female sex are usually in the proportion of four to one. Lastly, the distance from Britain, the unhealthy nature of the settlement, and the very moderate amount of the salaries, render it very difficult to procure respectable and duly qualified persons to fill the different official situations. Notwithstanding all these disadvantages, a gradual but decided improvement has taken place, and is becoming more sensible, as experience teaches the best modes of administering such an establishment. Within the last few years, both the extension and improvement of the colony have been particularly remarkable. With the efforts of the institution have been combined those of the Church Missionary Society, who have introduced, with great advantage, the British system of education.

Its first establishment was in the country schools; and in Freetown, where a different method had been originally employed, there occurred considerable obstacles to its introduction, from the murmurs of the parents, and the disinclination of the children. At length, however, the plan was completely successful, and the schools contain now 350 boys and girls, and 180 adults. In consequence of the great increase of population from disbanded soldiers, and still more from captured negroes, a number of new towns have been founded in different parts of the territory. The principal of these is Regent's

Town, which was found in 1816 by Mr. Johnson, the missionary teacher, in a state of the utmost barbarism. It contained 1100 captured negroes, belonging to twenty-two nations in all different parts of the continent, without any tie to each other, and many of them separated by deadly enmity. Some would live in the woods, apart from society; others, particularly those of the Eho nation, subsisted chiefly by thieving and plunder, stealing fowls, and eating them raw. One of them, having stolen a litter of nine pigs, was traced by the owner, who found that the animals had been all thrown alive into a pot of boiling water. Another, having lost a dog and pot, discovered the thief, and found the dog boiling in the pot for dinner. It was some time before any impression could be made on this savage population; but at length the labors of the excellent missionary, seconded by those of some intelligent negroes, produced the happiest effects. In the course of the few years which have since elapsed an entirely new scene has arisen. The town itself is laid out with regularity; nineteen new streets are formed and levelled, with good roads round the place; a large stone church rises in the midst of the habitations; a government-house, a parsonage-house, school-houses, store-houses, a bridge of several arches, some native dwellings, and other buildings, all of stone, are either finished, or on the point of being so. The state of cultivation farther manifests the industry of the people: all are farmers; gardens fenced in are attached to every house; all the land in the immediate neighbourhood is under cultivation; and there are fields even to the distance of three miles; vegetables and fruits are raised in abundance; and there is a good supply of domestic animals. Many of them, besides the cultivation of the ground, carry on trades; fifty are masons and bricklayers, forty carpenters, thirty sawyers, thirty shingle makers, twenty tailors, four blacksmiths, and two butchers. In these various ways upwards of 600 of the negroes provide for their own maintenance. The appearance and manners of the people have improved in an equal degree. They are all now decently clothed; almost all the females have learned to make their own clothing; about 400 couple are married; the attendance on public worship is regular and large, comprising on an average not less than 1200 or 1300 negroes, while Mr. Johnson's first congregation amounted only to nine; and the schools, which opened with 140 children and sixty adults, now contain upwards of 500 scholars. In the more immediate vicinity of Freetown, there are also the townships of Charlotte, Leopold, Gloucester, and Wilberforce. These, with Freetown, contain upwards of 2000 scholars, adults and children, in a course of regular instruction. Within the last two years, in consequence of the accessions to the population, four new and more distant stations have been formed; Waterloo, bordering on the Timmanees, and containing already 700 inhabitants; Wellington, near to Kissey; and Hastings, not yet risen to any importance. These are on the eastern side of the colony, while on the south-western is York, bordering on the Sherbro, where a settlement called Kent had already been formed.

Connected also with the colony, a settlement has been formed called Bathurst, at St. Mary's, on the Gambia. The population is increasing. The climate is said to be healthy, and provisions much cheaper than at Sierra Leona; and the opportunity afforded of communicating with the populous countries on that river renders it extremely valuable.

The following is the distribution and amount of the population of Sierra Leona, according to a census taken on the 8th of July 1820:—

Freetown and suburbs	4785
Leopold	469
Charlotte	268
Bathurst	469
Gloucester	563
Regent and vicinity	1213
Kissey and neighbourhood	1033
Wilberforce	409
Kent and vicinity	296
Waterloo	353
Hastings	195
Wellington	456
York	297
Leicester hamlet	78
Villages in peninsula	1468
Peninsula and isles in river	115
Gambia island	37

12,509

Of these, there are

Men	5796
Women	3020
Boys	
Girls	1678

12,509

According to nations, the above population is classed as follows:—

Europeans	120
Nova Scotians	730
Maroons	594
Natives	2989
Liberated negroes	8076

These statements are exclusive of the military (European and native) and their families. The increase since the census of the 31st of December 1818 is 2944, chiefly arising from the liberated negroes and discharged soldiers.

The following are the number of scholars educating according to the national system, in the different establishments:—

Freetown and suburbs	575
Leopold	144
Charlotte	106
Bathurst	113
Gloucester	258
Regent town	432
Kissey	158
Wilberforce	75
Kent	77
Waterloo	86
Hastings	57
Wellington	16

2097

Government at one period contemplated the abandonment of this settlement, but subsequently changed its purpose.

SIERRA MADRE, a ridge of mountains in North America, forming part of that vast chain which, under the different appellations of the Andes and Rocky Mountains, runs through the whole extent of the American continent, beginning at Terra del Fuego, and ending at the Icy Ocean in the north. The term of Sierra Madre, or Topia, is, however, more strictly applied to that elevated part of this immense ridge which commences near Guadalajara, and extends 450 miles in a northerly direction into New Mexico. The breadth of all its ridges or parallel crests, at this part, is sometimes 120 miles, where the chain is called more distinctively by the appellation of Sierra Madre, or Mother Ridge, on account of its great altitude above the other parts. Its sides are said to present the most sublime specimens of mountain scenery. This part of the chain, and indeed nearly the whole of it, is in general densely covered with forests of the most gloomy appearance, composed principally of pines and oaks. Here birds of every description, peculiar to the country, inhabit; and their variegated and beautiful plumage throws a ray of lustre on the sombre scene. On the summits of some of these mountains snow eternally lodges. Many rivers take their rise in the sides and near the tops of this Cordillera, and rush with impetuous force into the valleys below, whence they take their courses to the Atlantic and Pacific Oceans. During this period, when the natives are forced to much manual labor and bodily exertion in the open air, to repress the ravages of the waters, the mosquitoes become intolerable. The Sierra Madre sends off a branch in the west part of the province of New Mexico. This ramification is called Genes, and bears a south-easterly direction; whilst on the eastern side it throws off another arm, called the ridge of Nahmi, which is, however, of inferior height, and of shorter duration, than that of Genes. From the shore of the Pacific to the great Topian ridge, the general distance may be computed at 140 miles: in many places, however, it is greater, and in some, where the continent begins to straighten its bounds, not one-half that distance. The Topian chain takes the name of Sierra de las Grullas from 33° to 40° N. lat.; beyond that, to 42° N. lat., it receives the name of Sierra Verde. During its southern course it bears several distinct names, besides the general one of Sierra Madre.

SILERA DE QUINEROUCA AND PACARAIMO, a chain of the Andes, in New Granada, branching eastward from the main chain, near the lake Parima and the Amazons. It stretches towards French Guiana, where its form is little known, as the interior of that country is inhabited by Caribs and negroes, who keep the settlers at bay. The rivers of Berbice, Surinam, Marony, and Essequibo, rise in this part of the chain.

SIERRA MORENA, a chain of mountains in Spain, between the provinces of Cordova and Jaen on the south, and those of Estramadura and La Mancha on the north. About twenty-seven years ago this district was the dread of travellers; but by the exertions of M. Le Maur, a French engineer, who, in 1779, was appointed by count Florida Blanca to superintend the business, a new road has been made over, which is

equal to the finest in Europe; and, of consequence, several new towns have been built, and new settlements formed, in a district that had for many centuries continued barbarous and uncultivated.

SIEVE, *n. s.* } From sift. Hair or lawn

SIFT, *v. a.* } strained upon a hoop, by which flower is separated from bran, or fine powder from coarse; a boulder: to use a sieve; separate; try.

We have *sifted* your objections against those pre-eminences royal. *Hooker.*

All through the wit of Calvin could from thence draw, by *sifting* the very utmost sentence and syllable, is no more than that certain speeches seem to intimate that all Christian churches ought to have their elderships. *Id.*

Thy counsel

Falls now into my ears as profitless

As water in a *sieve*. *Shakspeare.*

I fear me, if thy thoughts were *sifted*,

The king thy sovereign is not quite exempt

From envious malice of thy swelling heart.

Id. Henry VI.

As near as I could *sift* him on that argument.

Shakspeare.

In the *sifting* of such favour, all that came out could not be expected to be pure meal, but must have a mixture of padar and bran. *Wotton.*

Opportunity I here have had

To try thee, *sift* thee, and confess have found thee Proof against all temptation, as a rock

Of adamant. *Milton's Paradise Regained.*

If life sunk through you like a leaky *sieve*,

Accuse yourself, you lived not while you might.

Dryden.

When yellow sands are *sifted* from below,

The glittering billows give a golden show. *Id.*

An innocent found a *sieve*, and presently fell to stopping the holes. *L'Estrange.*

One would think that every member, who embraces with vehemence the principles of either of these parties, had thoroughly *sifted* and examined them, and was secretly convinced of their preference to those he rejects. *Addison.*

SIEUR, *n. s.* a ci-devant title of respect among the French, like that of master among us, restored, we suppose, with many worse things of the old system. It was much used by lawyers, as also by superiors in their letters to inferiors.

SI-FANS, or TOU-FANS, a people inhabiting the country on the west of China. Their country is only a continued ridge of mountains, enclosed by the rivers Hoang-ho on the north, Yalong on the west, and Yang-tse-kiang on the east, between lat. 30° and 35° N. The Si-fans are divided into two kinds of people; the one are called by the Chinese Black Si-fans, the other Yellow, from the different colors of their tents. The black are the most clownish and wretched; they live in small bodies, and are governed by petty chiefs, who all depend upon a greater. The yellow Si-fans are subject to families, the oldest of which becomes a lama, and assumes the yellow dress. These lama princes, who command in their respective districts, have the power of trying causes, and punishing criminals; but their government is by no means burdensome; provided certain honors are paid them, and they receive punctually the dues of

the god Fo, which amount to very little, they molest none of their subjects. The greater part of the Si-fans live in tents; but some of them have houses built of earth, and even brick. Their habitations are not contiguous; they form at most but some small hamlets, consisting of five or six families. They feed a great number of flocks, and are in no want of any of the necessaries of life. The principal article of their trade is rhubarb, which their country produces in great abundance. Their horses are small; but they are well shaped, lively, and robust. These people are of a proud and independent spirit, and acknowledge with reluctance the superiority of the Chinese government, to which they have been subjected: when they are summoned by the mandarins they rarely appear; but the government, for political reasons, winks at this contempt, and endeavours to keep these intractable subjects under by mildness and moderation: it would, besides, be difficult by rigorous means to reduce them to perfect obedience; their wild and frightful mountains (the tops of which are always covered with snow, even in July) would afford them places of shelter, from which they could never be driven by force. The customs of these mountaineers are totally different from those of the Chinese. It is, for example, an act of great politeness among them to present a white handkerchief of taffety or linen when they accost any person whom they are desirous of honoring. All their religion consists in their adoration of the god Fo, to whom they have a singular attachment: their superstitious veneration extends even to his ministers, on whom they have considered it as their duty to confer supreme power and the government of the nation.

SIGÆUM, or SIGEUM, in ancient geography, a celebrated town of Troas, on a promontory so named, near the mouth of the Scamander, extending six miles along the coast. Near this town and promontory most of the battles between the Greeks and Trojans were fought, according to Homer, and there too Achilles was buried. This cape is now called Inehisari.

SIGAULTIAN OPERATION, a method of delivery in cases of difficult labor, first practised by M. Sigault. It consists in enlarging the dimensions of the pelvis, in order to procure a safe passage to the child without injuring the mother. See MIDWIFERY.

SIGESBECKIA, in botany, a genus of plants belonging to the class of syngenesia, and to the order of polygamia superflua; and in the natural system ranging under the forty-ninth order, compositæ. The receptacle is paleaceous; the pappus is wanting; the exterior calyx is pentaphyllous, proper, and spreading; the radius is halved. There are three species: 1. *S. flosculosa*, a native of Peru; 2. *S. occidentalis*, a native of Virginia; 3. *S. orientalis*, a native of China and India.

SIGH, *v. n.*, *v. a.* & *n. s.* Sax. *rican*, *ricettan*; Dut. *suchten*. To emit the breath audibly, as in grief: to lament; mourn: a violent and audible emission of the breath, as in sadness.

For the oppression of the poor, for the *sighing* of the needy, will I arise. *Psaln xii. 5.*

He *sighed* deeply in his spirit, and saith, Why doth this generation seek after a sign? *Mark* viii. 12.

Full often has my heart swoln with keeping my *sighs* imprisoned; full often have the tears I drove back from mine eyes turned back to drown my heart. *Sidney.*

Love is a smoke raised with the fume of *sighs*;
Being purged, a fire sparkling in lovers' eyes. *Shakspeare.*

What a *sigh* is there! The heart is sorely charged. *Id.*

I'll not be made a soft and dull-eyed fool,
To shake the head, relent, and *sigh*, and yield
To Christian intercessors. *Shakspeare. Merchant of Venice.*

Laughing, if loud, ends in a deep *sigh*; and all pleasures have a sting in the tail, though they carry beauty on the face. *Taylor.*

In Venus' temple, on the sides were seen
Issuing *sighs*, that smoked along the wall. *Dryden.*
Happier he,

Who seeks not pleasure through necessity,
Than such as once on slippery thrones were placed,
And, chasing, *sigh* to think themselves are chased. *Id.*

Ages to come, and men unborn,
Shall bless her name, and *sigh* her fate. *Prior.*

SIGHT, *n. s.* } Sax. *geriðe*; Belg. *sicht*; *Sax. geriðe*; Belg. *sicht*;
SIGHT'ED, *adj.* } Swed. *sigte*. Perception by
SIGHT'FUL, } the eye; the sense of seeing;
SIGHT'LESS, } view; notice; knowledge;
SIGHT'LY. } eye; opening for the eye;
to use; show; object of vision: sighted is, seen in a particular manner: sightful, watchful: sightless, blind; not sightly: sightly, agreeable to the sight.

Moses said, I will turn aside, and see this great *sight*, why the bush is not burnt. *Exodus* iii. 3.

Thus are my eyes still captive to one *sight*;
Thus all my thoughts are slaves to one thought still. *Sidney.*

As they might, to avoid the weather, pull the joints of the coach up close, so they might put each end down, and remain as discovered and open *sighted* as on horseback. *Id.*

But still, although we fail of perfect rightfulness,
Seek we to tame these childish superfluities;
Let us not wink, though void of purest *sightfulness*. *Id.*

Them seemed they never saw a *sight* so fair
Of fowls so lovely, that they sure did deem
Them heavenly born. *Spenser.*

Full of displeasing blots and *sightless* stains,
Patched with foul moles, and eye-offending marks. *Shakspeare.*

It lies as *sightly* on the back of him,
As great Alcides shews upon an ass. *Id. King John.*

Their armed staves in charge, their beavers down,
Their eyes of fire sparkling through *sights* of steel. *Shakspeare.*

Not an eye
But is a-weary of thy common *sight*,
Save mine, which hath desired to see thee more. *Id.*

If bees go forth right to a place, they must needs have *sight*. *Bacon.*

Nine things to *sight* required are;
The power to see, the light, the visible thing,
Being not too small, too thin, too nigh, too far,
Clear space, and time the form distinct to bring. *Davies.*

'Tis still the same, although their airy shape
All but a quick poetick *sight* escape. *Denham.*

Undaunted Hotspur

Brings on his army, eager unto fight,
And placed the same before the king in *sight*.

Daniel.

The king was very quick *sighted* in discerning difficulties, and raising objections, and very slow in mastering them. *Clarendon.*

O loss of *sight*, of thee I most complain!
Blind among enemies, O worse than chains,
Dungeon, or beggary, decrepit age!

Milton's Agonistes.

Things invisible to mortal *sight*. *Milton.*
Mine eye pursued him still, but under shade
Lost *sight* of him. *Id. Paradise Lost.*

What form of death could him affright,
Who unconcerned, with stedfast *sight*,
Could view the surges mounting steep,
And monsters rolling in the deep?

Dryden's Horace.

Æneas cast his wondering eyes around,
And all the Tyrrhene army had in *sight*,
Stretched on the spacious plain from left to right. *Dryden.*

A great many brave *sightly* horses were brought out, and only one plain nag that made sport. *L'Estrange.*

Having little knowledge of the circumstances of those St. Paul writ to, it is not strange that many things lie concealed to us, which they who were concerned in the letter understood at first *sight*. *Locke.*

I took a felucca at Naples to carry me to Rome, that I might not run over the same *sights* a second time. *Addison.*

We have thirty members, the most *sightly* of all her majesty's subjects; we elected a president by his height. *Id.*

It was writ as a private letter to a person of piety, upon an assurance that it should never come to any one's *sight* but her own. *Wake.*

The latent tracts, the giddy heights explore,
Of all who blindly creep or *sightless* soar. *Pope.*

Not proud Olympus yields a nobler *sight*,
Though gods assembled grace his towering height,
Than what more humble mountains offer here,
Where, in their blessings, all those gods appear. *Id.*

Before you pass the' imaginary *sights*
Of lords, and earls, and dukes, and gartered knights,
While the spread fan o'ershades your closing eyes,
Then give one flirt, and all the vision flies. *Id.*

My eyes are somewhat dimmish grown;
For nature, always in the right,
To your decays adapts my *sight*. *Swift.*

Their having two eyes and ears so placed is more *sightly* and useful.

More's Antidote against Atheism.

SIGIL, *n. s.* Lat. *sigillum*. Seal; signature.
Sorceries to raise the' infernal powers,
And *sigils* framed in planetary hours. *Dryden's Knight's Tale.*

SIGISMUND, of Luxemburg, emperor of Germany, was the son of Charles IV. and born in 1368. He married Mary, queen of Hungary, daughter of Louis the Great, and was elected king of Hungary in 1386. In 1396 he was defeated by Bajazet I. emperor of the Turks, and obliged to fly for refuge to Manuel, emperor of the East. See CONSTANTINOPLE. After the defeat of Bajazet by Tamerlane (see BAJAZET I.), he recovered his dominions, and in 1410 was elected emperor. See GERMANY. To restore peace to the church, then disturbed by the

schisms occasioned by the antipopes John XXIII. and Benedict XIV., he called the Council of Constance, 1414. To this council the celebrated John Huss was summoned, and obtained a safe conduct from Sigismund for his protection; notwithstanding which he was basely murdered. See *HUSS*. This infamous treachery provoked the Hussites to take up arms under Zisca, and gave rise to a bloody and barbarous war, which lasted eighteen years. Sigismund died in 1437.

SIGMA, Greek *σῑγμα*, in archæology. Among the Greeks the letter S had at first the form of a C, and the Romans having adopted this form in the construction of their tables, instead of the tricladium, the name of sigma was given to those which resemble the shape of a horseshoe, round which was placed a couch following the diameter of the table. The most honorable places were those at the two extremities of this bed, and at the void space left by the semicircle the servants introduced the meats.

SIGN, *n. s. & v. a.* } Fr. *signe*. A token; **SIGN-POST**, *n. s.* } that by which any thing is shown; a wonder; prodigy; memorial; distinctive mark; a constellation of the zodiac; a typical representation; symbol; to betoken; mark; ratify by signature: a sign-post is a post on which a sign is exhibited.

If they will not hearken to the voice of the first *sign*, they will not believe the latter *sign*.

Eccodus iv. 8.

The fire devoured two hundred and fifty men, and they became a *sign*. *Numbers* xxvi. 10.

An outward and visible *sign* of an inward and spiritual grace. *Common Prayer*.

They made *signs* to his father. *Luke*.

Signs must resemble the things they signify. *Hooker*.

Underneath an alehouse' paltry *sign*. *Shakspeare. Henry VI.*

There stay until the twelve celestial *signs* Have brought about their annual reckoning. *Shakspeare*.

You *sign* your place and calling in full seeming, With meekness and humility, but your heart Is crammed with arrogance. *Id. Henry VIII.*

Now did the *sign* reign, and the constellation was come, under which Perkin should appear. *Bacon's Henry VII.*

He barely named the street, promised the wine, But his kind wife gave me the very *sign*. *Donne*.

He should share with them in the preserving A shed or *signpost*. *Ben Jonson's Catiline*.

'True sorrow's like to wine, That which is good does never need a *sign*. *Suckling*.

The holy symbols or *signs* are not barely significative; but what they represent is as certainly delivered to us as the symbols themselves. *Broune*.

The sacraments and symbols are just such as they seem; but, because they are made to be *signs* of a secret mystery, they receive the names of what they themselves do *sign*. *Taylor*.

The ensign of Messiah blazed, Aloft by angels borne, his *sign* in heaven. *Milton*. Compelled by *signs* and judgments dire. *Id.*

Signs for communication may be contrived from any variety of objects of one kind appertaining to either sense. *Holder*.

After every foe subdued, the sun Thrice through the *signs* his annual race shall run. *Dryden*.

To express the passions which are seated in the heart by outward *signs*, is one great precept of the painters, and very difficult to perform.

Dryden's Dufresnoy.

This noble invention of our author's hath been copied by so many *signpost* dawblers, that now 'tis grown fulsome, rather by their want of skill than by the commonness. *Id.*

Be pleased to *sign* these papers: they are all Of great concern. *Id. Cleomenes*.

When any one uses any term, he may have in his mind a determined idea which he makes it the *sign* of, and to which he should keep it steadily annexed. *Locke*.

Wit and fancy are not employed in any one article so much as that of contriving *signs* to hang over houses. *Swift*.

SIGN, in general, is the mark or character of something absent, or invisible. See **CHARACTER**.

SIGN, among physicians, denotes some appearance in the human body, which serves to indicate or point out the condition of the patient with regard to health or disease.

SIGN, in algebra. See **ALGEBRA**.

SIGN, in astronomy. See **ASTRONOMY**.

SIGNAL, *n. s. & adj.* } Fr. *signal*. Notice **SIGNAL'ITY**, *n. s.* } by a sign; the sign **SIG'NALIZE**, *v. a.* } that gives notice: as **SIG'NALLY**, *adv.* } an adjective, noted; **SIGNA'TION**, *n. s.* } eminent; remarkable: the adverb corresponding: signality, remarkable quality (obsolete): to signalize is to make eminent or noted: signation, sign given; act of betokening.

The weary sun hath made a golden set, And, by the bright track of his fiery car, Gives *signal* of a goodly day to-morrow. *Shakspeare. Richard III.*

He was esteemed more by the parliament, for the *signal* acts of cruelty committed upon the Irish. *Clarendon*.

It seems a *signality* in providence, in erecting your society in such a juncture of dangerous humours. *Glanville*.

Of the ways whereby they enquired and determined its *signalitv*, the first was natural, arising from physical causes. *Broune*.

A horseshoe Baptistista Porta hath thought too low a *signation*, he raised unto a lunar representation. *Id.*

Scarce the dawning day began to spring, As, at a *signal* given, the streets with clamours ring. *Dryden*.

Persons *signally* and eminently obliged, yet missing of the utmost of their greedy designs in swallowing both gifts and giver too, instead of thanks for received kindnesses, have betook themselves to barbarous threatenings. *South*.

Many, who have endeavoured to *signalize* themselves by works of this nature, plainly discover that they are not acquainted with arts and sciences. *Addison*.

The Thames frozen twice in one year, so as men to walk on it, is a very *signal* accident. *Swift*.

Some one eminent spirit, having *signalized* his valour and fortune in defence of his country, or by popular arts at home, becomes to have great influence on the people. *Id.*

SIGNALS BY THE DRUM, made use of, in the exercise of the army, instead of the word of command, viz.

Signals.	Operations.
A short roll . . .	To caution.
A flam . . .	To perform any distinct thing.
To arms . . .	To form the line or battalion.
The march . . .	To advance, except when intended for a salute.
The quick march	To advance quick.
The point of war	To march and charge.
The retreat . . .	To retreat.
Drum ceasing . .	To halt.
Two short rolls .	To perform the flank firing.
The dragoon march	To open the battalion.
The grenadier march	To form the column.
The troop . . .	To double divisions.
The long roll . . .	To form the square.
The grenadier march	To reduce the square to the column.
The preparative . .	To make ready and fire.
The general . . .	To cease firing.
Two long rolls . .	To bring or lodge the colors.

SIGNALS, NAVAL. When we read the account of an engagement, or other interesting operations of an army, our attention is generally so much engaged by the results that we give but little heed to the movements which led to them, and produced them, and we seldom form any distinct notion of the conduct of the day. But a professional man follows every regiment in its movements, endeavours to see their connexion, and the influence which they have had on the fate of the day, and even to form to himself a general notion of the whole scene of action. He looks with the eye of the general. But few trouble themselves farther about the narration. The movement is ordered; it is performed; and the fortune of the day is determined. Few think how all this is brought about; and when they are told that, during the whole of the battle of Custrin, Frederick the Great was in the upper room of a country inn, whence he could view the whole field, while his aids-de-camp, on horseback, waited his orders in the yard below, they are struck with wonder, and can hardly conceive how it can be done; but, on reflection, they see the possibility of the thing. Their imagination accompanies the messenger from the inn yard to the scene of action, where the general's orders are delivered and executed. But when we think on the situation of the commander of a fleet, confined on board one ship, and this ship as much, or more closely, engaged than any other of the fleet; and when we reflect that here are no messengers ready to carry his orders to ships of the squadron at the distance of miles from him, and to deliver them with precision and distinctness, and that, even if this were possible by sending small ships or boats, the vicissitudes of wind and weather may render the communication so tedious that the favorable moment may be irretrievably lost before the order can be conveyed; when we think of all these circumstances, our thoughts are bewildered, and we are ready to imagine that a sea-battle is nothing but the unconnected struggle of indi-

vidual ships; and that when the admiral has once 'Cried havoc, and let slip the dogs of war,' he has done all that his situation empowers him to do, and he must leave the fate of the day to the bravery and skill of his captains and sailors. Yet it is in this situation, apparently the most unfavorable, that the orders of the commander can be conveyed with a despatch that is not attainable in the operations of a land army. The scene of action is unincumbered, so that the eye of the general can behold the whole without interruption. The movements which it is possible to execute are few, and they are precise. A few words are sufficient to order them, and then the mere fighting the ships must always be left to their respective commanders. This simplicity in the duty to be performed has enabled us to frame language fully adequate to the business in hand, by which a correspondence can be kept up as far as the eye can see. This is the language of signals, a language by writing, addressed to the eye, and which he that runneth may read. As in common writing certain arbitrary marks are agreed on to express certain sounds used in speech, or rather, as in hieroglyphics certain arbitrary marks are agreed on to express certain thoughts, or the subjects of these thoughts; so here certain exhibitions are made, which are agreed on to express certain movements to be executed by the commander to whom they are addressed, and all are enjoined to keep their eyes fixed on the ship of the conductor of the fleet, that they may learn his will. It is scarcely possible for any number of ships to act in concert, without some such mode of communication between the general and the commanders of private ships.

HISTORY OF NAVAL SIGNALS.—We have no direct information in the naval tactics of the ancient nations, how the Greeks and Romans managed their signals; but the necessity of the thing is so apparent that we cannot suppose it to have been omitted by the most ingenious and the most cultivated people who have appeared on the great theatre of the world; and we are persuaded that Themistocles, Conon, and other renowned sea commanders of Athens, had signals by which they directed the movements of their fleet. One signal was invented so early as the reign of king Ægeus; but so little were the Athenian tars then accustomed to signals that Theseus forgot to change it, and so the king perished. See *ÆGEUS*. We find, in the history of the Punic wars by Polybius, frequent allusions to such a mode of communication; and Ammianus Marcellinus speaks of the speculatores and vexillarii who were on board the ships in the Adriatic. The coins both of Greece and Rome exhibit both flags and streamers. In short, we cannot doubt of the ancients having practised this hieroglyphical language. In the naval occurrences of modern Europe, mention is frequently made of signals. We find, in particular, that queen Elizabeth, on occasion of the expedition to Cadiz, ordered her secretaries to draw up instructions, which were to be communicated to the admiral, the general, and the five councillors of war, and by them to be copied and transmitted to the several ships of

the navy, not to be opened till they should arrive in a certain latitude. It was on this occasion, says our historian Guthrie, 'that we meet with the first regular set of signals and orders to the commanders of the English fleet.' But, till the movements of a fleet have attained some sort of uniformity, regulated and connected by some principles of propriety, and agreed on by persons in the habit of directing a number of ships, we may with confidence affirm that signals would be nothing but a parcel of arbitrary marks, appropriated to particular pieces of naval service, such as attacking the enemy, landing the soldiers, &c., and that they would be considered merely as referring to the final result, but by no means pointing out the mode of execution, or directing the movements which were necessary for performing it. It was James II., when duke of York, who first considered this practice as capable of being reduced into a system, and who saw the importance of such a composition. He, as well as the king his brother, had always showed a great predilection for the sea service; and, when appointed admiral of England, he turned his whole attention to its improvement. He had studied the art of war under Turenne, not as a pastime, but as a science, and was a favorite pupil of that most accomplished general. When admiral of England, he endeavoured to introduce into the maritime service all those principles of concert and arrangement which made a number of individual regiments and squadrons compose a great army. When he commanded in the Dutch war, he found a fleet to be little better than a collection of ships, on board of each of which the commander and his ship's company did their best to annoy the enemy, but with very little dependence on each other, or on the orders of the general: and, in the different actions which the English fleet had with the Dutch, every thing was confusion as soon as the battle began. The famous pensionary De Witt, who from a statesman became a navigator and a great sea commander in a few weeks, made the same representation to the States General on his return from his first campaign. In the *Memoirs* of James II., written by himself, we have the following passage: '1665. On the 15th of March the duke of York went to Gunfleet, the general rendezvous of the fleet, and hastened their equipment. He ordered all the flag officers on board with him every morning, to agree on the order of battle and rank. In former battles, no order was kept, and this, under the duke of York, was the first in which fighting in a line and regular form of battle was observed.' This must be considered as full authority for giving the duke of York the honor of the invention. For, whatever faults may be laid to the charge of this unfortunate prince, his word and honor stand unimpeached, and we are anxious to vindicate his claim to it, because our neighbours the French, as usual, would take the merit of this invention, and of the whole of naval tactics, to themselves. True it is that Colbert, the great and justly celebrated minister of Louis XIV., created a navy for his ambitious and vain-glorious master, and gave it a constitution which may be a model for other nations to copy. By his encouragement, men of

the greatest scientific eminence were engaged to contribute to its improvement; and they gave us the first treatises of naval evolutions. But it must ever be remembered that our accomplished, though misguided sovereign, was then residing at the court of Louis; that he had formerly acted in concert with the French as commander and flag officer, and was at this time aiding them with his knowledge of sea affairs. In the memorable day of La Hogue, the gallant Russel, observing one of Tourville's movements, exclaimed, 'there! they have got Pepys among them.' It was on this occasion, then, that the duke of York made the movements and evolutions of a fleet the object of his particular study, reduced them to a system, and composed that 'System of Sailing and Fighting Instructions' which has ever since been considered as the code of discipline for the British navy, and which has been adopted by our rivals and neighbours as the foundation of their naval tactics. It does great honor to its author, although its merit will not appear very eminent to a careless surveyor, on account of that very simplicity which constitutes its chief excellence. It is unquestionably the result of much sagacious reflection and painful combination of innumerable circumstances, all of which have their influence; and it is remarkable that, although succeeding commanders have improved the subject by several subordinate additions, no change has to this day been made in its general principles or maxims of evolution. Till some such code be established, it is evident that signals can be nothing but arbitrary and unconnected hieroglyphics, to be learned by rote, and retained by memory, without any exercise of the judgment; and the acquisition of this branch of nautical skill must be a more irksome task than that of learning the Chinese writing. But, such a code being once settled, the character in which it may be expressed becomes a matter of rational discussion. Accordingly, the sailing and fighting instructions of the duke of York were accompanied by a set of signals for directing the chief or most frequent movements of the fleet. These also were contrived with so much judgment, and such attention to distinctness, simplicity, and propriety, that there has hardly been any change found necessary; and they are still retained in the British navy as the usual signals in all cases when we are not anxious to conceal our movements from an enemy. Notwithstanding this acknowledged merit of the duke of York's signals, it must be admitted that great improvements have been made on this subject, considered as an art. The art military has, in the course of a century past, become almost an appropriate calling, and has therefore been made the peculiar study of its professors. Our rivals, the French, were sooner, and more formally placed in this situation, and the ministers of Louis XIV. took infinite and most judicious pains to make their military men superior to all others by their academical education. A more scientific turn was given to their education, and the assistance of scientific men was liberally given them; and all the nations of Europe must acknowledge some obligations to them for information on every thing connected with the art of war. They

have attended very much to this subject, have greatly improved it, and have even introduced a new principle into the art; and thus have reduced it to the most simple form of reference to the code of sailing and fighting instructions, by making the signals immediately expressive, not of orders, but of simple numbers. These numbers being prefixed to the various articles of the code of instructions, the officer who sees a signal thrown out by the admiral reads the number, and reports it to his captain, perhaps without knowing to what it relates. Thus simplicity and secrecy, with an unlimited power of variation, are combined. M. de la Bourdonnais, a brave and intelligent officer, during the war 1758, was the author of this ingenious thought.

We do not propose to give a *system* of British signals. This would evidently be improper. But we shall show our readers the practicability of this curious language, the extent to which it may be carried, and the methods which may be practised in accomplishing this purpose. This may make it an object of attention to scientific men, who can improve it; and the young officer will not only be able to read the orders of the commander in chief, but will not be at a loss should circumstances place him in a situation where he must issue orders to others. Signals may be divided into, I. Day signals; II. Night signals; and, III. Signals in a fog. They must also be distinguished into, 1. Signals of evolution addressed to the whole fleet, or to squadrons of the fleet, or to divisions of these squadrons; 2. Signals of movements to be made by particular ships; and, 3. Signals of service, which may be either general or particular. The great extent of a large fleet, the smoke in time of battle, and the situation of the commander-in-chief, who is commonly in the midst of the greatest confusion and hottest fire, frequently makes it very difficult for the officers of distant ships to perceive his signals with distinctness. Frigates, therefore, are stationed out of the line, to windward or to leeward, whose sole office it is to observe the admiral's signals, and instantly to repeat them. The eyes of all the signal officers in the private ships of war are directed to the repeating frigates, as well as to the admiral; and the officers of the repeating frigates, having no other duty, observe the admiral incessantly, and, being unembarrassed by the action, can display the signal with deliberation, so that it may be very distinctly seen. Being minutely acquainted with the substitutions which must be made on board the admiral when his masts and rigging are in disorder, his (perhaps imperfect) signal is exhibited by the repeating frigate in its proper form, so as to be easily understood. And, to facilitate this communication, the commanders of the different squadrons repeat the signals of the commander in chief, and the commanders of division repeat the signals of the commanders of their squadron. Every evolution signal is preceded by a signal of advertisement and preparation, which is general, and frequently by a gun, to call attention; and, when all the signals have been made which direct the different parts of that evolution, another signal is made, which marks the close of the complete signal, and di-

vides it from others which may immediately follow it: and, as the orders of the commander-in-chief may relate either to the movements of the whole fleet, those of a single division, or those of certain private ships, the *executive signal*, which dictates the particular movement, is accompanied by a *directive signal*, by which these ships are pointed out to which the order is addressed. The commander of the ship to which any signal is addressed is generally required to signify by a signal, which is general, that he has observed it. And, if he does not thoroughly understand its meaning, he intimates this by another general signal. And here it is to be observed that, as soon as the signal is answered by the ships to which it is addressed, it is usual to haul it down, to avoid the confusion which might arise from others being hoisted in the same place. The order remains till executed, notwithstanding that the signal is hauled down. It may happen that the commander who throws out the signal for any piece of service sees reasons for altering his plan. He intimates this by a general *annulling* signal, accompanying the signal already given. This will frequently be more simple than to make the signals for the movements which would be required for re-establishing the ships in their former situation. All these things are of very easy comprehension, and require little thought for their contrivance. But, when we come to the particular evolutions and movements, and to combine these with the circumstances of situation in which the fleet may be at the time, it is evident that much reflection is necessary for framing a body of signals which may be easily exhibited, distinctly perceived, and well understood, with little risk of being mistaken one for another. We shall take notice of the circumstances which chiefly contribute to give them these qualities as we proceed in describing their different classes.

DAY SIGNALS.—These are made by means of the ship's sails, or by colors of various kinds. Those made with sails are but few in number, and are almost necessarily limited to the situation of a fleet at anchor. Thus,

The following Signals	usually signify.
Main top-gallant stay-sail hoisted	Officers and men belonging to the ship to come on board.
Fore top-sail loose	To prepare for sailing.
Main top-sail loose	To unmoor.
Main top-sail sheets hauled home	To weigh.
Main top-sail sheets clewed up, and the yard hoisted	Annul the former signal, and the ship to come to an anchor.
Top-gallant sails loose, and the sheets flying	Discovering strange sails.
Main top-gallant sail loose and hoisted.	Recal ships in chase.
Top-sail yard down.	
Mizen top-sail hoisted, and the sheets clewed up.	Moor.

Before we proceed to the description of the signals by means of colors, such as flags, banners (or triangular flags), pendants, or vanes, we must take notice of the ostensible distinctions, of the various divisions and subdivisions of a fleet, so that we may understand how the same signal may be addressed to a squadron, division, or single ship or ships. We suppose it known that a fleet of ships of war is distributed into three grand divisions, which we shall term squadrons, called the van, centre, and rear. These denominations have not always a relation to the one being more advanced than the other, either towards the enemy, or in the direction of their course. In a land army, the position of every part is conceived from its reference to the enemy; and the reader, conceiving himself as facing the enemy, easily understands the terms van, centre, and rear, the right and left wing, &c. But, the movements of a sea army having a necessary dependance on the wind, they cannot be comprehended unless expressed in a language which keeps this circumstance continually in view. The simplest and most easily conceived disposition of a fleet, is that in which it is almost indispensably obliged to form in order to engage an enemy. This is a straight line, each ship directly a-head of its neighbour, and close hauled. This is therefore called the line of battle. In this position the two extremities of the fleet correspond to the right and left wings of an army. Suppose this line to be in the direction east and west, the wind blowing from the N. N. W., and therefore the fleet on the starboard tack; the ships' heads are to the west, and the westernmost division is undoubtedly the van of the fleet, and the easternmost division is the rear. And it is in conformity to this arrangement, and situation, that the *list of the fleet* is drawn up. But the ships may be on the same east and west line, close hauled, with their heads to the west, but the wind blowing from S. S. W. They must therefore be on the larboard tack. The same ships, and the same division, are still, in fact, the van of the fleet. But, suppose the ships' heads to be to the eastward, and that they are close hauled, having the wind from S. S. E. or N. N. E., the ships which were the real van, on both tacks in the former situation, are now, in fact, the rear on both tacks; yet they retain the denomination of the van squadron of this fleet, and are under the immediate direction of the officer of the second rank, while the other extremity is under the direction of the third officer. This subordination therefore is rather an arrangement of rank and precedence than of evolution. It is, however, considered as the natural order to which the general signals must be accommodated. For this reason the division which is denominated van, in the list of this fleet, is generally made to lead the fleet when in the line of battle on the starboard tack, and to form the weathermost column in the order of sailing in columns; and, in general, it occupies that station from which it can most easily pass into the place of the leading division on the starboard line of battle a-head. Although this is a technical nicety of language, and may frequently puzzle a landsman in reading an account of naval operations, the reflecting and intelligent reader will see the

propriety of retaining this mode of conceiving the subordinate arrangement of a fleet, and will comprehend the employment of the signals which are necessary for re-establishing this arrangement, or directing the movements while another arrangement is retained. This being understood, it is easy to contrive various methods of distinguishing every ship by the place which she occupies in the fleet, both with respect to the whole line, with respect to the particular squadron, the particular division of that squadron, and the particular place in that division. This may be done by a combination of the position and color of the pendants and vanes of each ship. Thus the color of the pendants may indicate the squadron; their position or mast on which they are hoisted may mark the division of that squadron; and a distinguishing vane may mark the place of the private ship in her own division. The advantages attending this method are many. In a large fleet it would hardly be possible for the commander-in-chief to find a sufficient variety of single signals to mark the ship to which an order is addressed, by hoisting it along with the signal appropriated to the intended movement. But by this contrivance one-third part of these signals of address is sufficient. It also enables the commander-in-chief to order a general change of position by a single signal, which otherwise would require several. Thus, suppose that the fore, main, and mizen masts, are appropriated, with the proper modifications, for exhibiting the signals addressed to the van, the centre, and the rear squadrons of the fleet, and that a red, a white, and a blue flag, are chosen for the distinguishing flags of the officers commanding these squadrons; then, if the commander-in-chief shall hoist a red flag at his mizen top-gallant mast head, it must direct the van squadron to take the position then occupied by the rear squadron, the evolution necessary for accomplishing this end, being supposed known by the commander of the squadron, who will immediately make the necessary signals to the squadron under his particular direction. In the same manner, the distinguishing signal for the leading ship of a squadron being hoisted along with the signal of address to the whole fleet, and the signal for any particular service, will cause the three or the nine leading ships to execute that order, &c. &c. All that has been said hitherto may be considered as so many preparations for the real issuing of orders by the commander-in-chief. The most difficult part of the language remains, viz. to invent a number of signals which shall correspond to that almost infinite variety of movements and services which must be performed. Distinctness, simplicity, and propriety, are the three essential qualities of all signals. A signal must be some object easily seen, strongly marked, so that it may be readily understood, with little risk of its being mistaken for another. When made by flags, banners, or pendants, they must be of the fullest colors, and strongest contrasts. The ships are frequently at a very great distance, so that the intervening air occasions a great degradation of color. They are seen between the eye and a very variable sky; and in this situation, especially in the morning or evening, or a dark day, it is not easy to

distinguish one full color from another, all of them approaching to the appearance of a black. At the distance of a very few miles hardly any full colors can be distinguished but a scarlet and a blue. Red, blue, yellow, and white, are the colors which can be distinguished at greater distances than any others, and are therefore the only colors admitted as signals. Even these are sometimes distinguished with difficulty. A yellow is often confounded with a dirty white, and a blue with a red. All other dark colors are found totally unfit. But, as these afford but a small variety, we must combine them in one flag, by making it striped, spotted, or chequered, taking care that the opposition of color may be as great as possible, and that the pieces of which the flags are made up may not be too minute. Red must never be striped nor spotted with blue, and the stripes, spots, or chequers, should never be less than one-third of the breadth of the flag. Their colors are represented by hatching, in the same manner as in heraldry. See HERALDRY. Difference of shape, as flags, banners, or pendants, is another distinction by which the expression may be varied. And, in doing this, we must recollect that in light winds it may be difficult to distinguish a flag from a banner, as neither are fully displayed for want of wind to detach the fly from the staff. And, lastly, signals may be varied by their position, which may be on any lofty and well detached part of the masts, yards, or rigging. Similarity is an eminent property in all signals.

They are addressed to persons not much accustomed to combinations, and who are probably much occupied by other pressing duties. It were to be wished that every piece of service could be indicated by a single flag. This is peculiarly desirable with respect to the signals used in time of battle. The rapid succession of events on this occasion call for a multitude of orders from the commander-in-chief, and his ship is frequently clad over with flags and pendants, so that it is exceedingly difficult for the signal officer of a private ship to distinguish the different groups, each of which make a particular signal. These considerations are the foundation of a certain propriety in signals, which directs us to a choice among marks which appear altogether arbitrary. Signals which run any risk of being confounded, on account of some resemblance, or because their position hinders us from directly perceiving their difference, should be appropriated to pieces of service which are hardly possible to be executed, or can hardly be wanted in the same situation. No bad consequence could easily result, though the signal

or coming to closer action should resemble that for unmooring, because the present situation of the ships makes the last operation impossible or absurd. Such considerations direct us to select for battle signals those which are of easiest exhibition, are the most simple, and have the least dependence on the circumstance of position; so that their signification may not be affected by the damages sustained in the masts or rigging of the flag ship. Such signals as are less easily seen at a distance should be appropriated to orders which can occur only in the middle of the fleet, &c., &c. Signals which are made to the admiral

by private ships may be the same with signals of command from the flag-ship, which will considerably diminish the number of signals perfectly different from each other. With all these attentions and precautions, a system of signals is at last made up, fitted to the code of sailing and fighting instructions. It is accompanied by another small set for the duty of convoys. It must be engrossed in two books; one for the officer of the flag-ship, who is to make the signals, and the other is delivered to every private ship. In the first the evolutions, movements, and other operations of service, are set down in one column, and their corresponding signals in another. The first column is arranged, either alphabetically, by the distinguishing phrase, or systematically, according to the arrangement of the sailing and fighting instructions. The officer whose duty it is to make the signals, turns to this column for the order which he is to communicate, and in the other column he finds the appropriated signal. In the other book, which is consulted for the interpretation of the signals, they are arranged in the leading column, either by the flags, or by the places of their exhibition. The first is the best method, because the derangement of the flag-ship's masts and rigging in time of action may occasion a change in the place of the signal. The *Tactique Navale* of the chevalier de Morogues contains a very full and elaborate treatise on signals. We recommend this work to every sea-officer, as full of instruction. The art of signals has been greatly simplified since the publication of this work, but we cannot but ascribe much of the improvements to it. We believe that the author is the inventor of that systematic manner of addressing the order or effective signal to the different squadrons and divisions of the fleet, by which the art of signals is made more concise, the execution of orders is rendered more systematic, and the commanders of private ships are accustomed to consider themselves as parts of an army, with a mutual dependence and connexion. We are ready enough to acknowledge the superiority of the French in manœuvring, but we affect to consider this as an imputation on their courage. Nothing can be more unjust; and dear-bought experience should long ere now have taught us the value of this superiority. What avails that courage which we would willingly arrogate to ourselves, if we cannot come to action with our enemy, or must do it in a situation in which it is almost impossible to succeed, and which needlessly throws away the lives of our gallant crews? Yet this must happen, if our admirals do not make evolutions their careful study, and our captains do not habituate themselves, from their first hoisting a pendant, to consider their own ship as connected with the most remote ship in the line. We cannot think that this view of their situation would in the least lessen the character which they have so justly acquired, of fighting their ship with a courage and firmness unequalled by those of any other nation. And we may add that it is only by such a rational study of their profession that the gentleman can be distinguished from the mercenary commander of a privateer.

Night signals.—It is evident that the com-

munication of orders by night must be more difficult and more imperfect than by day. We must, in general, content ourselves with such orders as are necessary for keeping the fleet together, by directing the more general movements and evolutions which any change of circumstances may render necessary. And here the division and subordinate arrangement of the fleet is of indispensable necessity, it being hardly possible to particularise every ship by a signal of address, or to see her situation. The orders are therefore addressed to the commanders of the different divisions, each of whom is distinguished by his poop and top-lights, and is in the midst of, and not very remote from, the ships under his more particular charge. Yet, even in this unfavorable situation, it is frequently necessary to order the movements of particular ships. Actions during the night are not uncommon. Pursuits and rallies are still oftener carried on at this time. The common dangers of the sea are as frequent and more disastrous. The system of signals therefore is very incomplete till this part be accomplished. Night signals must be made by guns, or by lights, or by both combined. Gun-signals are susceptible of variety both in number and in disposition. The only distinct variation which can be made in this disposition is by means of the time elapsed between the discharges. This will easily admit of three varieties, slow, moderate, and quick. Half-minute guns are as slow as can easily be listened to as appertaining to one signal. Quarter-minute guns are much better, and admit of two very distinct subdivisions. When the gunners, therefore, are well trained to this service (especially since the employment of fire-locks for cannon), intervals of fifteen or twelve seconds may be taken for slow firing, eight or ten seconds for moderate, and four or five seconds for quick firing. If these could be reduced one-half, and made with certainty and precision, the expression would be incomparably more distinct. A very small number of firings varied in this way will give a considerable number of signals. Thus five guns, with the variety of only quick and moderate, will give twenty very distinguishable signals. The same principle must be attended to here as in the flag-signals. The most simple must be appropriated to the most important orders, such as occur in the worst weather, or such as are most liable to be mistaken. Quick firing should not make part of a signal to a very distant ship, because the noise of a gun at a great distance is a lengthened sound, and two of them, with a very short interval, are apt to coalesce into one long continued sound. This mode of varying gun-signals by the time must therefore be employed with great caution, and we must be very certain of the steady performance of the gunners. Note, that a preparatory signal, or advertisement that an effectual signal is to be made, is a very necessary circumstance. It is usual (at least in hard weather) to make this by a double discharge, with an interval of half a second, or at most a second. Gun-signals are seldom made alone, except in ordinary situations and moderate weather; because accident may derange them, and inattention may cause them to escape notice, and, once

made, they are over, and their repetition would change their meaning. They are also improper on an enemy's coast, or where an enemy's cruisers or fleets may be expected. Signals by lights are either made with lights, simply so called, i. e. lanterns shown in different parts of the ship, or by rockets. Lights may differ by number, and by position, and also by figure. For the flag-ship, always carrying poop or top lights, or both, presents an object in the darkest nights, so that we can tell whether the additional lights are exhibited about the mainmast, the foremast, the mizen-mast, &c. And if the lights, shown from any of these situations are arranged in certain distinguishable situations in respect to each other, the number of signals may be greatly increased. Thus three lights may be in a vertical line, or in a horizontal line, or in a triangle, and the point of this triangle may be up, or down, or forward, or aft, and thus may have many significations. Lights are also exhibited by false fires or rockets. These can be varied by number, and by such differences of appearance as to make them very distinguishable. Rockets may be with stars, with rain fire, or simple squibs. By varying and combining these, a very great number of signals may be produced, fully sufficient to direct every general movement or evolution, or any ordinary and important service. The chevalier de Morogues has given a specimen of such a system of night signals, into which he has even introduced signals of address or direction to every ship of a large fleet; and has also given signals of number, by which depths of soundings, points of the compass, and other things of this kind, may be expressed both easily and distinctly. He has made the signals by rockets perfectly similar in point of number to those by lanterns, so that the commander can take either; a choice which may have its use, because the signals by rockets may cause the presence of a fleet to be more extensively known than may be convenient. The commander-in-chief will inform the fleet by signal, that guns, or perhaps rockets, are not to be used that night. This signal, at the same time, directs the fleet to close the line or columns, that the light signals may be better observed. It is indeed a general rule to show as few lights as possible; and the commander frequently puts out his own poop and top lights, only showing them from time to time, that his ships may keep around him. The signal lanterns on board the flag-ship, and a lantern kept in readiness on board of every private ship, to answer or acknowledge signals from the commander-in-chief, are all kept in bags, to conceal their lights till the moment they are fixed in their places, and the preparatory or advertising signal has been made. The commander-in-chief sometimes orders by signal every ship to show a light for a minute or two, that he may judge of the position of the fleet; and the admiral's signal must always be acknowledged by those to whom it is addressed. It is of particular importance that the fleet kept together. Therefore the leading ships the fleet, on either tack, are enjoined to acknowledge the signals of the commander-in-chief by a signal peculiar to their station. Thus the commander-in-chief learns the position of the extre

ities of his feet. In framing a set of night signals, great attention must be given to their position, that they be not obscured by the sails. The nature of the order to be given will frequently determine this. Thus an order for the rear ships to make more sail, will naturally direct us to exhibit the signal at the mizen peak; and so of other pieces of service. Lanterns, exposed in groups, such as triangles, lozenges, &c., are commonly suspended at the corners of large frames of laths, at the distance of a fathom at least from each other. Attempts have been made to show lights of different colors; but the risk of mistake or failure in the composition, at the laboratory, makes this rather hazardous. Colored lanterns are more certain; but, when the glasses are made of a color sufficiently intense, the vivacity of the light (which at no time is very great) is too much diminished. Besides, the very distance changes the color exceedingly and unaccountably.

Signals in a fog.—These can be made only by noises, such as the firing of cannon and muskets, the beating of drums and ringing of bells, &c. Fog signals are the most difficult to contrive of any, and are susceptible of the least variety. The commander in chief is principally concerned to keep his fleet together; and, unless something very urgent requires it, he will make no change in his course or rate of sailing. But a shift of wind or other causes may make this necessary. The changes which he will order, it will be prudent to regulate by some fixed rule, which is in general convenient. Thus, when a fleet is in the order of sailing upon a wind, and a fog comes on, the fleet will hold on the same course. If the wind should come a little more on the beam, the fleet will still keep close to the wind. Certain general rules of this kind being agreed on, no signals are necessary for keeping the fleet together; and the ships can separate or run foul of each other only by difference in their rate of sailing, or by inaccurate steerage. To prevent this the commander-in-chief fires a gun from time to time, and the ships of the fleet judge of his situation and distance by the sound. The commanders of divisions fire guns, with some distinction from those of the commander-in-chief. This both informs the commander-in-chief of the position of his squadrons, and enables the private ships of each division to keep in the neighbourhood of their own flag ship. On board of every private ship the drum is beaten, or the bell is chimed, every quarter of an hour, according as the ship is on the starboard or larboard tack. By such contrivances it is never difficult to keep a fleet in very good order when sailing on a wind. The wind is almost always moderate, and the ships keep under a very easy sail. It is much more difficult when going large, and separation can be prevented only by the most unwearied attention. The greatest risk is the falling in with strange ships steering another course. But evolutions and other movements are frequently indispensable. The course must be changed by tacking or wearing, and other services must be performed. None, however, are admitted but the most probable, the most simple, and the most necessary. The com-

mander-in-chief first informs the fleet, by the preparatory fog signal, that he is about to order an evolution, and that he is to direct it by fog signals. This precaution is indispensable to prevent mistakes. Along with this advertising signal he makes the signal of the movement intended. This not only calls the attention of the fleet, but makes the ships prepare for the precise execution of that movement. The commanders of divisions repeat the advertising signal, which informs their ships of their situation, and the private ships beat their drums or chime their bells. Thus the whole ships of the fleet close a little, and become a little better acquainted with their mutual position. It is now understood that a movement is to be made precisely a quarter of an hour after the advertisement. At the expiration of this time, the effective signal for this movement is made by the commander-in-chief, and must be instantly repeated by the commanders of divisions, and then the movement must be made by each ship, according to the sailing and fighting instructions. This must be done with the utmost attention and precision, because it produces a prodigious change in the relative position of the ships: and, even although the good sense of the commander-in-chief will select such movements for accomplishing his purposes as produce the smallest alterations, and the least risk of separation or running foul of each other, it is still extremely difficult to avoid these misfortunes. To prevent this, as much as possible, each ship which has executed the movement, or which has come on a course thwarting that of the fleet, intimates this by a signal properly adapted, often adding the signal of the tack on which it is now standing, and even its particular signal of recognisance. This is particularly incumbent on the flag ships and leading ships of each division. After a reasonable interval, the commander-in-chief will make proper signals for bringing the fleet to a knowledge of their re-union in this new position. This must serve for a general account of the circumstances which must be attended to in framing a code of signals. The arbitrary characters in which the language is written must be left to the sagacity of the gentlemen of the profession. It must be observed that the stratagems of war make secrecy very necessary. It may be of immense hazard if the enemy should understand our signals. In time of battle it might frequently frustrate our attempts to destroy them, and at all times would enable them to escape, or to throw us into disorder. Every commander of a squadron, therefore, issues private signals, suited to his particular destination; and therefore it is necessary that our code of signals be susceptible of endless variations. This is exceedingly easy without any increase of their number. The commander needs only intimate that such and such a signal is so and so changed in its meaning during his command. We cannot leave this article without returning to an observation which we made almost in the beginning, viz. that the system of signals, or, to speak more properly, the manner of framing this system, has received much improvement from the gentlemen of the French navy, and particularly from the ingenious thought of M. de la Bourdonnais, of making the

signals the immediate expressions of numbers only, which numbers may be afterwards used to indicate any order whatever. We shall present our readers with a scheme or two of the manner in which this may be done for all signals, both day, night, and fog. This alone may be considered as a system of signals, and is equally applicable to every kind of information at a distance. Without detracting in the smallest degree from the praise due to M. de la Bourdonnais, we must observe that this principle of notation is of much older date. Bishop Wilkins, in his *Secret and Swift Messenger*, expressly recommends it, and gives specimens of the manner of execution; so does Dr. Hooke in some of his proposals to the Royal Society. Gaspar Schottus also mentions it in his *Technica Curiosa*; and Kircher, among others of his *Curious Projects*. M. de la Bourdonnais's method is as follows: He chooses pendants for his effective signals, because they are the most easily displayed in the proper order. Several pendants, making part of one signal, may be hoisted by one halyard, being stopped on it at the distance of four or six feet from each other. If it be found proper to throw out another signal, at the same time and place, they are separated by a red pendant without a point. His colors are chosen with judgment, being very distinctly recognised, and not liable to be confounded with the addressing signals appropriated to the different ships of the fleet. They are,

For No. 1. Red.

2. White.

3. Blue.

4. Yellow.

5. Red, with white tail.

6. Red, with blue tail.

7. White, with blue tail.

8. White, with red tail.

9. Blue, with yellow tail.

10. Yellow, with blue tail.

Three sets of such pendants will express every number under 1000, by hoisting one above the other, and reckoning the uppermost hundreds, the next below it tens, and the lowest units. Thus the number 643 will be expressed by a pendant red with blue tail, a yellow pendant below it, and a blue one below the last. This method has great advantages. The signals may be hoisted in any place where best seen, and therefore the signification is not affected by the derangement of the flag ship's masts and rigging. And, by appropriating the smaller numbers to the battle signals, they are more simple, requiring fewer pendants. As this method requires a particular set of colors, it has its inconveniences. An admiral is often obliged to shift his flag, even in time of action. He cannot easily take the colors along with him. It is therefore better to make use of such colors as every private ship is provided with. One set of eleven will do, with the addition of three, at most of four pendants, of singular make, to mark 100, 200, 300, 400. Two of these flags, one above the other, will express any number under 100, by using the eleventh as a substitute for any flag that should be repeated. Thus the eleventh flag, along with the flag for 8 or for 6, will express the number 88 or 66,

&c. Thus we are able to express every number below 500, and this is sufficient for a very large code of signals. And, in order to diminish as much as possible the number of these compound signals, it will be proper that a number of single flag signals be preserved, and even varied by circumstances of position, for orders which are of very frequent occurrence, and which can hardly occur in situations where any obstructions are occasioned by loss of masts, &c. And farther, to avoid all chance of mistake, a particular signal can be added, intimating that the signals now exhibited are numerary signals; or, which is still better, all signals may be considered as numerary signals; and those which we have just now called single flag signals may be set down opposite to, or as expressing the largest numbers of the code. This method requires the signal of advertisement, the annulling signal, the signal of address to the particular ship or division, the signal of acknowledgment, the signal of indistinctness, of distress, of danger, and one or two more, which, in every method, must be employed. Another method of expressing numbers with fewer colors is as follows:—Let the flags be A, B, C, D, E, F, and arrange them as follows:

	A	B	C	D	E	F
	1	2	3	4	5	6
A	7	8	9	10	11	12
B	13	14	15	16	17	18
C	19	20	21	22	23	24
D	25	26	27	28	29	30
E	31	32	33	34	35	36
F	37	38	39	40	41	42

The number expressed by any pair of flags is found in the intersection of the horizontal and perpendicular columns. Thus the flag D, hoisted along with and above the flag F, expresses the number 40, &c. In order to express a greater number (but not exceeding 84) suppose 75, hoist the flags C, which expresses 33, or 75, wanting 42, and above them a flag or signal G, which alone expresses 42. This method may be still further improved by arranging the flags thus:

	A	B	C	D	E	F
	1	2	3	4	5	6
A	7	8	9	10	11	12
B	—	13	14	15	16	17
C	—	—	18	19	20	21
D	—	—	—	22	23	24
E	—	—	—	—	25	26
F	—	—	—	—	—	27

In this last method the signification of the signal is totally independent of the position of the flags. In whatever parts of the ship the flags D and E are seen, they express the number twenty-three. This would suit battle signals. Another method still may be taken. Flags hoisted any where on the fore-mast may be accounted units, those on the main-mast tens, and those on the mizen-mast hundreds. Thus numeral signals may be made by a ship dismasted, or having only poles in their place. Many other ways may be contrived for expressing numbers by colors, and there is great room for exercising the judgment of the

contriver. For it must always be remembered, that these signals must be accompanied with a signal by which it is addressed to some particular ship or division of the fleet, and it may be difficult to connect the one with the other, which is perhaps shown in another place, and along with other executive signals. One great advantage of these numeral signals is, that they may be changed in their signification at pleasure. Thus, in the first method, it can be settled that, on Sundays, the colors A, B, C, D, &c., express the cyphers 1, 2, 3, 4, &c., but that on Mondays they express the cyphers 0, 1, 2, 3, &c., and on Tuesdays the cyphers 9, 0, 1, 2, &c.; and so on through all the days of the week. This mean of secrecy is mentioned by Dr. Hooke for the coast and alarm signals, where, by the bye, he shows a method for conveying intelligence over land very similar to what is now practised by the French with their telegraph. It is equally easy to express numbers by night signals. Thus M. de la Bourdonnais proposes that one discharge of a great gun shall express 7, and that 1, 2, 3, 4, 5, 6, shall be expressed by lights. Therefore, to express twenty-four, we must fire three guns and show three lights. This is the most perfect of all forms of night and fog signals. For both the manner of firing guns and of exhibiting lights may be varied to a sufficient extent with a very few guns or lights, and with great distinctness. Thus, for guns, let *F* mark the firing of a single gun at moderate intervals, and *ff* a double gun, that is, two discharged at the interval of a second. We may express numbers thus:—

1	<i>F</i> .
2	<i>F, F</i> .
3	<i>F, F, F</i> .
4	<i>F, F, F, F</i> .
5	<i>F, ff</i> .
6	<i>F, F, ff</i> .
7	<i>F, ff, F</i> .
8	<i>F, ff, F, F</i> .
9	<i>F, ff, F, ff</i> .
10	<i>ff, F</i> .
100, &c.	<i>ff, ff, F</i> or <i>ff, ff, ff</i> .

It might be done with fewer guns if the *ff* were admitted at the first firing. But it seems better to begin always with the single gun, and thus the double gun beginning a signal, distinguishes the tens, &c. In like manner, a small number of lights will admit of a great variety of very distinct positions, which may serve for all signals to ships not very remote from the commander-in-chief. For orders to be understood at a very great distance, it will be proper to appropriate the numbers which are indicated by signals made with rockets. These can be varied in number and kind to a sufficient extent, so as to be very easily distinguished and understood. It is sufficient to have shown how the whole, or nearly the whole, notation of signals may be limited to the expression of numbers. We have taken little notice of the signals made by private ships to the commander-in-chief. This is a very easy business, because there is little risk of confounding them with other signals. Nor have we spoken of signals from the flag-ships, whose ultimate interpretation is number, as when ships are

directed to change their course so many points. Those also are easily contrived in any of the methods already described: also when a private ship wishes to inform the commander-in-chief that soundings are found at so many fathoms. In like manner, by numbering the points of the compass the admiral can direct to chase to any one of them, or may be informed of strange ships being seen in any quarter, and what is their number.

The following are some of the principal significations now in use:

1. To denote being on the starboard tack.
2. To denote being on the larboard tack.
3. To anchor.
4. To denote being anchored, half an hour after.
5. To moor, or, if before moored, to unmoor.
6. To weigh.
7. To tack.
8. To haul to the wind on the starboard tack.
9. To haul to the wind on the larboard tack.
10. To wear, the sternmost and leewardmost ships first in succession, and continue in the same situation, whether of sailing, or lying-to as before.
11. To alter course to starboard.
12. To alter course to larboard.
13. To lie-to on the starboard tack.
14. To lie-to on the larboard tack.
15. On discovering danger.
16. If in distress and in want of immediate assistance.
17. On striking and sticking fast on a shoal.

In the Instructions, it is observed, that the signal guns will be all fired to windward, or on the same side during the continuance of a fog.

The admiral, in the execution of his intentions to tack, wear, &c., will not begin to change his situation until ten minutes after the respective signals shall have been made, except upon any extraordinary emergency: meaning thereby to allow a sufficient time for the ships near him to be prepared for the same movement. In case of a sudden shift of wind, or wind springing up after a calm, and not being then favorable for continuing the course before steered, or that the admiral thinks proper to steer a different course; on such occasions he will make the signals for lying-to or the signals for sailing by the wind on either tack that will best correspond with his further intentions. And, if the wind by such alteration becomes favorable for sailing large on the course he intends to steer, he will soon after signify, by the proper signal, the number of points he means to steer from the wind on either tack accordingly.

During a fog, the admiral will continue the same course on which he was steering before the fog commenced, whilst the wind continues favorable for enabling him to do so: but if it comes a-head when before sailing large, or before the wind, he will keep the wind with a full sail, not to go more than three knots an hour. If the wind decreases, he will make sail in proportion, for continuing his former rate of sailing, except by setting studding-sails. If the fleet is to bring to under the top-sail, the main top-sail will be to the mast. If under courses, it will be with

the main-sail, and the fore-yard braced up. When in the channel, or on a coast, and the signal is made for anchoring, the ships are to anchor immediately. And it is to be remembered that the firing of muskets in volleys, is to denote the being anchored; it should, therefore, be continued some time in each ship, until there is reason to think the whole or greater part of the fleet have anchored. The repeating frigates are not to repeat signals during a fog.

SIGNALS, COMPASS (Fr. *compas de signaux*), are made with certain flags and pendants, and occasionally used as auxiliaries to the Numerical day signals to be hereafter noticed. When any general signal is accompanied with either of the compass signals, expressive of a particular point, the direction in which the ships are to proceed, to carry the purpose of such signal into execution, is meant to be thereby denoted; as when the signal is made to chase, to alter course, &c. On strange ships being discovered (and so of any other occasion when the bearing is necessary to be made known), the quarter is to be denoted by the proper compass signal; and, when answered by the admiral, the compass signal is to be hauled down once for each strange ship seen; or the number may be indicated by a numeral signal.

John M'Arthur, esq. LL. D., formerly secretary to admiral lord Hood, made various improvements in day and night signals, as well as telegraphic communications. That is, early in the year 1790, he laid before the earl of Chatham, then first lord of the admiralty, a code of day signals, combining a tabular and numerary plan, on very simple principles, and susceptible of great variety and extent of ideas. He observes, in his introduction, 'that having been frequently stationed during the American war to observe signals in fleets, and with a view of obviating the difficulties that frequently arose from showing flags at a particular part of a ship, as well as for facilitating the signification of all signals, it had been the pursuit of his leisure moments, since the year 1782; when he first digested a compendium on a plan analogous, though not mature, and presented it to admiral Digby, then commander-in-chief of his majesty's ships and vessels in North America.

'The precise execution,' he observes, 'of all naval evolutions, is attainable by the good order and discipline of the respective ships, and a harmonious and speedy compliance with the signals. It is this which gives force and agility to the movements of a fleet, uniting or separating the divisions, or the bodies composing it, according to the exigencies of the moment; and the fewer evolutions that are put in execution in presence of an enemy the better, unless with a view of obtaining an advantageous position, to arrange the fleet in line of battle. In the formation or change of positions, in all evolutions with large bodies, there must at times occur, in the best disciplined fleets, a temporary disunion, separation, or irregularity of some of the ships, in getting into that compact order necessary.

'The order of sailing, in as compact an order as the weather will permit, is essential for the

due observance of signals, and for forming with celerity and precision the line of battle. In fleets from twelve to twenty sail, the order of sailing is generally in three squadrons or divisions, and, in fleets consisting of twenty-four to thirty-six sail of the line, the order of sailing is usually in six divisions; for it is a known truth in naval, as well as in military tactics, that the more compact or collected the order of sailing in divisions, or the order of march of armies in columns, are adhered to in approaching an enemy, the more power and agility they will have in the arrangement for action.' As, therefore, the regularity and prompt execution of all naval evolutions depend on the nice observation and speedy understanding of ideas attached to signals, it was Mr. M'Arthur's aim to simplify them, though combining different plans, and to divest them of every ambiguity and misunderstanding. For that purpose, he not only devised the plan of signals alluded to, by partly uniting to the methodical ideas of Locke on his *Common-place Book*, a numerical moveable index of the flags; but also had arranged and classed all signals under eight general and relative heads, viz. 1. Anchoring. 2. Calling officers and boats. 3. Chasing. 4. Convoys and prizes. 5. Fighting evolutions. 6. Sailing evolutions. 7. Private ships' signals to the admiral. 8. Miscellaneous.

The compartments or leaves of the book appropriated to these heads respectively were subdivided alphabetically into the emphatical words, or purport of the signals, connected with the general heads; thus serving as an index, incorporated with the table of flags and significations, for the admiral's greater promptitude and facility in making the necessary signals, as well as for private ships immediately referring to the significations indicated.

The signals are comprised into two tables opening from the centre of the book. The tabular flags used are only twelve in number, which, with the aid of an auxiliary or substitute flag, to save the expense of having duplicate flags, express 312 literal significations (independent of a vast variety of signals in a numeral sense to be hereafter noticed), being more than is required for any code of navy signals. The plan being simple and homogeneous, no pendants nor triangular flags are requisite, either for denoting the points of the compass, duty of launches and boats, or for distinguishing signals, denoting particular squadrons, divisions, &c., of the fleet. The whole, as well as private ships' signals, are compressed into one code, &c., indicated by thirteen flags only, instead of thirty flags, besides a variety of pendants and triangular flags, &c., as were formerly, and are still used in the navy.

There is also a consideration of some importance recommended in the adoption of this plan, namely, that the captain of every private ship in the fleet, being at all times furnished with the thirteen established signal flags, may on any emergency be immediately detached on a particular service, and thereby as a commanding officer can communicate his ideas, in the language of signals, with the same facility he was

accustomed to obey them, while in a subordinate situation.*

Each table has twelve leaves annexed, corresponding to the number of tabular flags, and each page or leaf is subdivided into twelve different compartments, on a line with the flags denominated inferior, for the more speedy finding the signification of any signal. Flags of any color or description may be used, but the twelve tabular flags selected for this code are not only such as are capable of expressing a second arrangement of distinct signals when inverted† or reversed, but have also two colors contrasted in each flag, as are best seen at a distance, and according to the ascertained observations on the change or vicissitudes of the atmosphere, namely, red and white, blue and white, yellow and white.

In the proper order of hoisting the signals, the red, blue, or yellow color of the flag, is always uppermost, or next the mast; in the inverted or reversed order, the white part of the flag, is uppermost, or next the mast. In the first table the flags are shown proper, and in the second they are exhibited inverted or reversed. Hence twelve tabular flags, with a substitute flag, indicate, as already noticed, 312 literal significations; and, by way of illustration, the first table is exhibited in plate SIGNALS, comprising 156 numbers, referring to signals composed in sentences or distinct significations. The same flags, inverted and reversed, form a second table (which, being easily understood, it is not necessary to explain by a plate), making with the former 312 significations, besides the numerary and alphabetic plans of which the code is susceptible, indicating upwards of 20,000 additional ideas, all of which are illustrated by examples given in the introduction to these signals.

Explanation of the plate exhibiting the twelve tabular flags in the proper order,‡ with the substitute flag.

The twelve flags are exhibited horizontally in the upper column, and these identical flags are again shown vertically in the lateral or left side column, and the substitute is shown separately at the bottom. The numbers from one to twelve, placed immediately under the upper column of flags, not only denote signals, appropriated to single flags, but are indices to refer to the compartments of significations allotted to each of the superior flags, whether hoisted singly or with an inferior flag.

* It was usual to furnish captains of private ships with certain flags only for making signals to the admiral, but they were not supplied with the general signal-flags of the commander-in-chief; consequently no junior officer could be detached on any service without much detriment and inconvenience.

† The term inverted is to be understood when a flag is shown upside down; namely, half red and half white horizontally divided, will be inverted when the white is shown uppermost.—Reversed is applied when a flag is turned the contrary way to the mast, or where it is hoisted, namely, a red and white, divided vertically, is reversed when the white part is next to the mast.

‡ Red color is indicated in the plate of flags by vertical strokes or lines, blue by horizontal strokes, and yellow by small dots.

The superior flags, with the index numbers attached, have the intervening leaves cut transversely, in order to exhibit at one view the compartment or leaf, on which the signification corresponding to the signal made is to be found, where, casting the eye on the lateral or side column flag, the signification is instantly found.

Each table has twelve leaves annexed; that is, one leaf of paper for each flag, and each page or leaf is divided horizontally by lines of separation for the written signification of signals into thirteen compartments. The superior flags with index numbers being cut transversely, in the form of a merchant's alphabet to a ledger; and the flags in the lateral columns being painted in their proper colors, on the twelfth leaf back from the opening of the table are, by this contrivance, always in view with the superior flag, both in front and whatever part of the book may be turned to; therefore when any signal is made, suppose with two flags, the observer has only to place his thumb on the upper flag; and turning over to its compartment, and looking on the left for the inferior, he will instantly find the same number as is shown in the angle of meeting in the table, or opening of the book, as well as the signification of the signals; while, to prevent mistakes, he has at the same time the superior and inferior flags of the signal constantly in view.

Thus, for example, if flag B were hoisted superior, and flag M inferior; or, in other words, if No. 2, blue and white flag in the upper column, was placed over No. 1, red and white in the lateral column, the number 25 will be found in the corresponding angle or square of the table; and, by placing the thumb on the superior flag B, you turn over the cut leaves immediately to the page where the literal signification of the signal to the corresponding number twenty-five is expressed, in a line to the inferior flag M. If the same superior flag B were hoisted with the substitute flag, or which, in other words, implies in this tabular form a duplicate of the superior, the number 26 will be found in the angle of meeting, and the signification is written at length on the page back, on a line facing the duplicate or inferior flag on the side column; hence the substitute is here used merely to stand in the place of a duplicate flag, and giving a value to the tabular numbers as expressed in the angles of meeting or squares of the table. Thus the signals expressing the tabular numbers 13, 26, 39, 52, 65, 78, 91, 104, 117, 130, 143, and 156, have the superior and lateral flags represented as of the same denomination, the substitute in these instances is to be always hoisted inferior, as standing in place of a duplicate of the superior flag; but in the numerary application of the plan to be hereafter noticed, the substitute will express a repetition of the superior flag in corresponding units.

When the substitute flag is hoisted alone, in the tabular plan, it signifies annulling the preceding signal; and, by being hoisted superior to any of the other twelve flags, it may be appropriated to particular signals, independent of the tabular or numeral ones.

The twelve flags, by being painted in duplicates

on silk or vellum, may be made to shift or slide on thin box-wood attached to the upper and lateral columns, in order that the order or place of the flags may be changed or transposed to different numbers, when the admiral may think it necessary, so that nothing need be apprehended from the code of signals falling into the hands of an enemy. In this respect the substitute flag may, when hoisted over any other flag, indicate the transposition of that tabular flag to the place of No. 1, and the other eleven flags are to follow such change of place in the progressive order they stand, whereby the tabular system, with respect to flags indicating numbers, becomes totally changed, while the original significations of the signals remain permanent.*

Numerary and alphabetic combinations, with the thirteen flags of the table in the plate—The plan is not confined solely to the simple tabular form already explained, and which would suffice to denote a greater number of signals than has heretofore been practised in the navy; but it is susceptible of a numerary combination capable of expressing 20,000 additional ideas, applicable to so many words of a dictionary or vocabulary regularly numbered from 1, to 20,000. The letters of the alphabet can also be easily denoted, by applying as marked in the table the signals first in order from 1 to 26 inclusive. This is so obvious that it requires no further explanation. For the better understanding of the numerary combination, reference will be first made to the ten flags numbered in the lateral column from one to ten, which, with the aid of the substitute, can express 10,000 signals, by hoisting the flags in the proper order as represented; and, when these flags are shown inverted or reversed, 10,000 additional ideas can be denoted.

1. *With one or two flags.*—The signal flags from 1 to 9, hoisted singly, will express their corresponding numbers as units, and flag 10 is to be considered the cypher flag. When two flags are shown at the same time, the one hoisted superior will express tens, and the under one units: thus flag 2 over flag 4 would express 24; flag 3 over flag 10, or cypher, would express 30; and flag 4 hoisted over the substitute would denote 44. The substitute in this combination being always considered a repetition in units of the number immediately above it; the signals, therefore, that can be expressed by one or two flags are 99 in number.

2. *With three flags.*—When three flags are shown at the same time, the superior denotes hundreds, the next tens, and the lower one units. Thus, if 346 were to be expressed, flag 3 would be hoisted superior for hundreds, the flag 4 next for tens, and flag 6 for units; consequently, the number of signals, with the combination of three flags, will be 999 in number.

3. *With four flags.*—When four flags are

shown, at the most conspicuous parts of a ship, the superior flag will denote thousands, and the three others hundreds, tens, and units, as in the preceding article. The number of signals, with the combination of four flags, will be 9999 in number.

Additional substitute flags.—Having assigned one substitute flag for the first combination with two flags, which for distinction's sake is termed the integral substitute, it is proper that a second and third should be assigned to the other combinations, so as to leave no chasm in the progressive numbering of hundreds and thousands; therefore the flag 11, with the letter W prefixed, is termed the decimal substitute, when three flags, including it, are hoisted: and flag 12, with the letter X prefixed, is termed the centesimal substitute when four flags are hoisted.

Example with three flags.—If 333 were to be expressed, flag 3 would be hoisted uppermost; next to it the decimal substitute, and the lowest would be the integral substitute.

Example with four flags.—If 4144 were to be denoted, the flag 4 would be superior, the centesimal substitute next, then the decimal and integral substitutes. If 4044, the cypher-flag would be under flag 4 the superior, then the decimal and integral substitutes, and so on of the other numbers wherever a substitute flag was necessary to the last in the combination; namely, 9999, which would be expressed by flag 9 superior to the three substitutes in their proper order.

To complete the series to 10,000, the cypher-flag is to be hoisted superior to the three substitutes in their natural order.

By inverting or reversing the numerical flags, the value of 10,000 is added to each signal, whereby 10,000 additional ideas on the same principles can be expressed; consequently, the two arrangements, with only thirteen flags, will denote 20,000 signals or words of a dictionary.

Example in the inverted order of the tabular flags. If 10,023 were to be expressed, it would only be necessary to hoist flag 2 inverted over flag 3, also inverted. To denote 10,123, the three flags 1, 2, 3, would be inverted. To denote 12,345, the superior flag 2 for so many thousands would be shown inverted, next flag 3 would be shown inverted, then the diagonal flags 4 and 5 would be shown reversed; that is, the white part next the mast, and so forth, always bearing in mind that by this order of inverting or reversing the flags, there are 10,000 added to the original numbers which the signals would otherwise express, if the flags were hoisted in the original or proper order.

The above plan of tabular and numerary signals was illustrated by plates containing a variety of essential evolutions in the order of sailing and lines of battle. But although it was allowed to possess great ingenuity, and met with a favorable reception from the admiralty, there appears to have been an insurmountable obstacle to its adoption, principally, it was said, arising from a numerary plan of day signals digested by earl Howe, then in contemplation to have been brought into general practice, when an opportunity offered.

* This suggestion of a transposition-flag was afterwards adopted in the New Arrangement of lord Howe's Signals, prepared by Mr. M'Arthur in 1792; and a single flag was then appropriated to that purpose.

Alterations and improvements to the code of day and night signals now established in the navy.—In the Spanish armament of 1790, and Russian armament of 1791, earl Howe's day signals, printed in quarto, with instructions, also his night signals, were issued to his majesty's ships under the orders of admiral lord Hood, commander-in-chief, then also one of the lords commissioners of the admiralty. In the summer of 1792, when a rupture with the French republic was apprehended, lord Hood was appointed to the command of a squadron in the Channel, 'for the purpose of exercising the officers and men in the order of battle, and of sailing, and other duties in their several stations, which might best qualify them for service, preparatory to and in battle against an enemy.'

During this service, in which a squadron of fifteen sail, including frigates, was exercised in the various evolutions indicated by earl Howe's day signals, Mr. M'Arthur, the admiral's secretary, turned his attention to render them more simple and perspicuous, by preparing a new arrangement, in which several important alterations and additions were incorporated, drawn from the code which he had, as already noticed, presented two years antecedently to the admiralty. From motives of respect and delicacy towards earl Howe, sir Hyde Parker, then acting as captain of the fleet under lord Hood, transmitted to the former a copy of Mr. M'Arthur's explanatory observations on the proposed new arrangement of day signals and instructions. The whole having been subsequently laid before the lords commissioners of the admiralty, they were approved of and printed in the latter end of 1792, under Mr. M'Arthur's superintendence, with all the alterations and additions he had suggested, together with a new code of night signals, he had at the same time compiled, and submitted for approval.

From that period these day signals and instructions, together with the new code of night signals alluded to, and to be hereafter noticed, have been issued to his majesty's ships, with little or no variation in form or substance. The following being the principal heads of the explanatory observations prefixed to the new arrangement of lord Howe's signals, submitted to the admiralty, they will suffice to give the reader a competent idea of the improvements suggested, and which were ultimately adopted.

Signal book—1. The column of purport in earl Howe's quarto Signal Book is proposed to be done away entirely, and a copious alphabetical and numerical index substituted; the present arrangement, therefore, may be printed in a convenient octavo size, with as large a type as lord Howe's quarto impression.

2. By leaving a small blank space on the outer margin of the leaves, the index to the signals and instructions, as well as the numbers on each page, may be exhibited in the form cut out in the accompanying Signal Book; whereby both books become at once arranged either for a flag or private ship. Similar attention has been paid to private ships' signals, to which is added a numerical index, whereby signals are made with facility, and their significations found without any further arrangement.

3. Every signal has immediate reference to the article relative to it in the Instruction Book; and, that the articles may not be mistaken for the pages, they are always referred to in Roman numerals. The like is attended to in the indices, and the numbers of the signals are placed in figures on the left hand, so as not to be mistaken for the pages referred to on the right.

4. Instead of the leaves formerly allotted to the supplemental flags, they are now exhibited to view on two pages only, under the title of Single Flags appropriated to particular Signals independent of the Numerals; therefore no number or article is attached to them as formerly, but the purport of each retained, by which it is distinguished when referred to, either in the Signal or Instruction Book; thus, affirmative flag, annulling flag, rendezvous, preparative, &c.

5. The single flags appropriated to particular signals being arranged as in the preceding article, the numeral signals are made to commence at No. 1, instead of No. 13, as formerly in lord Howe's code, and from 13 the numbers and significations follow as heretofore.

6. To the end that the numbers and significations may be permanent, and to remove every apprehension of their being useful to the enemy in case of getting possession of them in this regular form, in the accompanying model of a signal board, the numerical flags, painted in a duplicate order, are made to change or slide, with observations on an additional signal proposed to be inserted in the department allotted. Single flags (namely, by the introduction of what is called a key or transposition flag, which, when hoisted, denotes that the numeral or integral flag hoisted under it is to be transposed or changed to the upper place allowed, No. 1;) and the other eight integral flags are to follow such change of place in the progressive order they stand, whereby the numeral system becomes totally changed. This suggestion may, perhaps, on a due consideration, be deemed worthy of adoption.

7. The table of triangular flags, page 6, Signal Book, is proposed to be substituted for the former one, as being more simple in form.

8. In some signals it has been thought necessary to insert a N. B. illustrative of them taken from the Instructions; such as signals 4, 24, 25, &c., whereby signals that formerly appeared on a perusal of the Instructions only, are now brought forward to view in the proper departments of the respective signals.

9. Should the new signals 10, 11, and 12, relative to enforcing the general station signal, No. 4, not be deemed essential, they may remain blanks, or be appropriated for other significations.

10. If the Signal Book were printed on stout paper, and half bound, it would admit the margin to be cut out in the form submitted, with great regularity, as alphabetical and numerical indices, and be equally adapted for a commander-in-chief to make signals, as well as private ships to refer immediately to the significations indicated. Eight plates are annexed of the most essential evolutions, with instructions on the principal movements. These are entirely new, and have been introduced for the reasons to be noticed in the subsequent article

INSTRUCTION BOOK TO THE DAY SIGNALS.

All the instructions are arranged and consolidated in one book under general heads, having a copious alphabetical index annexed; and it is humbly submitted, whether it may not be deemed proper to print this Instruction Book in folio, as a size more convenient than octavo for being left open on a table under either of the general heads or running titles corresponding to the situation of the fleet; for were it printed octavo size, the same as the Signal Book, it would be too thick and bulky to remain open on a table. On the other hand, the necessity of having the Instruction Book carried on the quarter-deck seldom occurs, but the Signal Book is always necessary to have recourse to, and, as such, an octavo is the most convenient form for the latter, more particularly as the signals are now arranged for that purpose.

In order to avoid all ambiguity and confusion, one mode of technical expression has been adhered to, both in the Signal Book and Instruction; viz. squadrons, to express the three component parts of a fleet, either in the order of sailing or in line of battle: divisions, to express such parts into which squadrons may be divided either in the order of sailing by divisions, or in the line of battle: column is applied only to the fleet in the order of sailing in two columns or grand divisions.

The only chain of new matter that has been attempted to be introduced into earl Howe's General Instructions for Ships of War are the following instructions for the conduct of the fleet in the execution of the principal movements of the evolutions, which are illustrated by figures projected on principles consonant to those of the best naval tacticians, and in strict conformity to the ideas of lord Howe, diffused in his General Instructions. In the practice of evolutions it is obvious that rules for the execution of the movements of a fleet in order of battle are useful and requisite; and the want of which has been often regretted by flag-officers and captains, more especially, as a due observance of them will tend to make the squadrons or divisions move with promptitude and regularity in the order indicated by general signal.

I. Instructions for the conduct of the fleet in the execution of the principal movements of the evolutions, as referred to in the preceding explanatory observations.

When the admiral makes general signals, for any intended evolution, it is to be understood that the movements thereby indicated are to be put in execution the instant the preparative flag is hauled down, and the general signal left flying; and the respective commanders of squadrons, instead of repeating such general signals, are (so soon as conveniently may be after answering it) to prepare their squadrons to act together, or in succession, by putting abroad the signal corresponding to the established movements herein contained; and, when the admiral hauls down the preparative flag to the evolution, the commanders of squadrons are likewise to haul down the preparative to the movements, that the squadrons, divisions, or ships denoted may forthwith put the same in execution.

To the end that the squadrons or division may act with regularity and promptitude, in the formation of the evolution, indicated by general signal, and thereby preserve in all movements the compact order necessary, the subordinate flag-officers, and captains of ships respectively, are enjoined to adhere to the established instructions to the movements, and not to deviate from them unless upon some extraordinary emergency rendering the same expedient.

When the admiral would have the fleet form a line of battle, one ship a-head of another, he hoists a union flag on the mizen-peek, and fires a gun; and every flag-ship does the like. But when they are to form a line of battle, one a-breast of another, he hoists a pendant with the union-flag, &c. When he would have the admiral of the white, or him that commands in the second post, to tack, and endeavour to gain the wind of the enemy, he spreads a white flag under the flag at the main-topmast-head, and fires a gun; and when he would have the vice-admiral of the blue do so, he does the same with the blue flag. If he would have the rear-admiral of the red do so, he spreads a red flag from the cap on the fore-topmast-head, downward on the back-stay; if the vice-admiral of the blue, he spreads a blue flag, &c., and fires a gun. If he would have the rear-admiral of the red do so, he hoists a red flag at the flag-staff at the mizen-topmast head; if the rear-admiral of the white, a white flag; if the rear admiral of the blue, a blue flag, and under it a pendant of the same color, with a gun. If he be to leeward of the fleet, or any part of it, and he would have them bear down into his wake or grain, he hoists a blue flag at the mizen-peek, and fires a gun; and all the flag-ships are to do the same. The fleet being in a line of battle, if he would have the ship that leads the van hoist, lower fet, or hawl up any of her sails, he spreads a yellow flag under that at the mizen-topmast-head, and fires a gun, which signal the flag-ships are to answer; and the admiral will hoist, lower, fet, or hawl up the sail, which he would have the ship that leads the van do, which is to be answered by the flag-ships of the fleet. When the enemies retreat, and he would have the whole fleet follow them, he makes all the sail he can after them himself, and takes down the signal for the line of battle, and fires two guns out of his fore-chase, which the flag-ships answer; and then every ship is to endeavour to come up with, and board the enemy. When he would have the chase given over, he hoists a white flag at the fore-topmast-head, and fires a gun. If he would have the red squadron draw into a line of battle, one a-breast of another, he puts abroad a flag, striped with red and white, on the flag-staff at the main-topmast-head, with a pendant under it, and fires a gun; if the white or second squadron is to do so, the flag is striped red, white, and blue; if the blue, or third squadron is to do so, the flag is a Genoese ensign and pendant; but if they are to draw into a line of battle, one a-head of another, the same signals are made with a pendant. If they are to draw into a line of battle, one a-stern of another, with a large wind, and he would have the leaders go with the starboard tacks, aboard the wind, he hoists a red and white

flag at the mizen-peek, and fires a gun; but if they should go with the larboard tack aboard by the wind, he hoists a Genoese flag at the same place, which signals, like others, must be answered by the flag-ships.

Before we enter on the subject of night signals, it may be advisable to notice a mode of preparing an artificial light for the purpose, which has generally been kept a secret. It is sold in wooden boxes; the fire produced from one of these boxes of six inches diameter, and four inches high, which was lighted by General Roy on the English coast, was seen very distinctly by M. Michain, with the naked eye, on the French coast, at the distance of forty miles over the sea, in overcast and cloudy weather.

The fire from another of these boxes, lighted by M. Legendree of Dunkirk, was seen with the naked eye by M. Cassini, at Cape *Blanc-nez*, as distinctly as the planet Venus when brightest, although the distance was 20,000 toises.

The powder was prepared in the following manner:—

Twenty-four parts of saltpetre, seven parts of flower of sulphur, and two parts of red arsenic, are pulverised and well mixed together. This mixture is inclosed in round or square boxes of thin wood; in general the height of the round box is half their diameter, and the square are made double the size of the round. They are closed with a cover of the same wood, in the middle of which a small hole is made, by which the powder is lighted.

When these boxes are made for carriage, paper is pasted all round them, and also over the hole in the lid, that the powder may not be scattered. When the box is lighted, the paper that covers the joining of the lid is first taken off, and then that which is over the hole; it is lighted with a common match, and takes fire in an instant, without explosion. It spreads a very brilliant light, with a little smoke, which the person who lights it must be careful to avoid; a box of six inches diameter, and three inches high, burns nearly for the space of three minutes, and the light may be perceived a little before sunset, at the distance of 36,000 toises. The light of this fire is so dazzlingly bright, that it effects the eyes of those who approach very near it, in the same manner as the sun, rendering them incapable of distinguishing objects for some time afterwards.

The price of this powder is nearly the same as common powder.

The matches are prepared as follows; four parts of refined saltpetre are pulverised, and well mixed with two parts of gunpowder, two parts of charcoal, and one part of flowers of sulphur; the whole is then passed through a sieve. This powder is put into paper cartridges the length of the quill of a pen, the cartridges are made of strong paper rolled round a stick two feet long, and the powder is pressed in with a piece of round wood of the same dimensions.

These matches are fastened to a stick of a suitable length, the edge of the paper is cut with scissars, and the match is lighted by a candle. The effect never fails, and the matches are proof against wind and rain. In order to extinguish them the lighted end must be cut off.

An artificer of Marseilles proposes to make these matches of a mixture of eight parts of flowers of sulphur, four of saltpetre, and two of gunpowder, the whole reduced to a fine powder, and well mixed together.

Another mode by which night-signals may be made, with advantage to the service, must also be adverted to. It consists in the employment of oxygen and hydrogen gasses, impelled, when in a state of combustion, against a conical piece of chalk. This process is of a purely chemical nature, and the laboratory mode of producing light by this means would be perfectly inapplicable at sea. The chemist employs two japanned copper tanks floating in water, and the pressure of the water displaces the gas. Now this apparatus is not sufficiently stable for nautical purposes;—it will be necessary, therefore, to have the gases condensed in strong iron receivers, and the openings connected with the gas burners defended with safety tubes.

When well-burned Carvara marble is made into a thin paste, it is almost equal to pure chalk, both in the intensity of its light and the purity of its colour. Lime from chalk, however, admits of being turned in the lathe so that any number of small balls with a slender stem of the same material, uniform in size, and perfect in figure, may be kept ready for use. The surface of the ball, by the continued action of the heat, is nearly in a state of fusion during the whole operation. With an apparatus of this kind a distance of thirty or forty miles is no bar to the most accurate reading of the signals. The plan was, we believe, first adopted by Lieutenant Drummond in the great trigonometrical survey of England.

NIGHT SIGNALS.

*Observations on the numerary night signals established in the navy:—*The code of night-signals now used had been chiefly arranged from a plan devised by that ornament to his profession the late admiral Kempenfelt, on numerary principles, by the combination of guns, lights, and false fires. Sir Hyde Parker, captain of the fleet under admiral lord Hood, having in his possession admiral Kempenfelt's ideas of MS., relative to this new mode of communicating signals in the night, and which from his lamented death had not been brought to maturity; they were put into the hands of Mr. M'Arthur, secretary to the commander-in-chief, at the time he was as already noticed preparing, in the autumn of 1792, a new arrangement of earl Howe's Day Signals and Instructions, to be submitted to the consideration of the admiralty. From these original sources, Mr. M'Arthur presented to the lords commissioners of the admiralty in a digested form, with some alterations and additions, the Numerary Code of Night Signals alluded to.

Admiral Kempenfelt having left no instructions to his plan, the principal part of earl Howe's old Night Instructions was very judiciously selected, so far as was applicable to the New Code of Night Signals; but some additional instructions were deemed necessary to complete the

arrangement. These night signals and instructions, thus prepared and comprised, with indices, in one small octavo volume, were then adopted, and have ever since been used in his majesty's navy. As it may be deemed improper to give publicity to these night signals, or to exhibit in this work a detail of the principles on which they are founded, suffice it to observe that the utility of the plan, compared to that formerly in practice by showing lights at particular parts of a ship, or in the form of triangles, squares, or lozenges, where best seen, is too obvious to be dwelt upon; yet, when a fleet is in the presence of an enemy, it may be proper to make signals in the night by lights only.

Lord Hood, knowing well how to appreciate every improvement in naval tactics, was the first commander-in-chief of a fleet who issued to the flag-officers of squadrons and captains of ships under his orders, at the commencement of the war in 1793, the New Arrangement of Day and Night Signals above noticed; and their utility since that period has been confirmed by the practice and experience of every successive commander-in-chief. From the observations of many intelligent officers, it was found that the code of numery night signals, although it had advantages in some respects over every other known mode practised, yet there was a desideratum sought after, namely, to give privacy to night signals when in expectation of falling in with an enemy, or approximating the line of an enemy's coast. It is, therefore, the object of the following auxiliary plan, proposed by Mr. M'Arthur, to remedy the disadvantages that might eventually result by firing guns, as the component part of the numery combination to night signals, and which may still be continued as the standing system, when the fleet is not in expectation of falling in with the enemy. This can be effected by the combinations of four distinct lights, without the aid of guns or false fires; and the mode proposed will have the superadded advantage of being occasionally employed as a nocturnal telegraph, for naval or military purposes.

General principles to be adopted.

1. An improvement in the construction of signal lanterns; and, as only four are required for each ship, they ought to be issued as an article of store by the navy office.

2. The signals are to be made from on board ship where best seen, forward or abaft; or if a ship be directly a-head or a-stern of other ships to whom these signals are to be communicated. The signal lanterns may be shown at the larboard and starboard yard-arms, where best seen; but, if used on shore, the left hand post or signal staff; and the right hand post or staff, are to be considered synonymous terms to the application, at sea, of forward and abaft, or larboard and starboard yard-arms.

3. The combination of two, three, or four lights, shown at sea forward or abaft, or at the larboard and starboard yard-arms; but, if on

shore, hoisted on the left post or right, together with one or two obscurations of the lights, either in a horizontal or vertical position, will denote more ideas than is required for any code of night signals.

The lanterns are to be made in a cylindrical form; dimensions about nine inches diameter, and proportionable height. A lamp with four burners is to be placed in a socket in the centre, and so constructed that, if a lantern should happen to be upset, the oil cannot be spilt. Instead of horn or glass to the lanterns it is proposed to substitute talc, or what is commonly known by the name of Muscovy glass, which is equally as transparent as common glass, is much lighter, and will not consume by fire.

Each lantern to have an obscurer of tin or canvas, to denote the combinations to be hereafter explained. These obscurers to be in the form of cylinders, perforated with air-holes at the tops and open at the bottoms so as to encircle or cover the lanterns, and thereby eclipse the lights when necessary.

The obscurations, or eclipses, of the lights, are thus practised with facility:—Suppose the four lights hoisted vertically, or one over the other, at the usual distance of ten or twelve feet asunder, each lantern to have its obscurer placed from five to six feet over it, and, by a line passing through a small block attached to the lantern halyards, any of the lights at the word of command would be obscured. In exposing the light again, it is only necessary to haul the topping line of the obscurer, while the lantern remains in the same permanent situation.

The lanterns and mode of obscuring the lights being premised, the plan is susceptible of the following arrangement:—The first will denote, as by preparatory signal, that the combinations are to be applied telegraphically, to the letters of the alphabet. The second arrangement will denote, by preparatory signal, the first twenty-five numbers allotted to the significations in the standing Night Signal book for the navy, and in order to express fifty additional numbers, making in all seventy-five signals, which is more than the numery code with guns, lights, and false-fires comprehend, an obscuration of one light for an interval of twenty or thirty seconds will denote the numbers from 26 to 50 inclusive; and the obscuration of two lights will denote the numbers from 51 to 75 inclusive, as expressed in the following table:—The open cyphers, thus ○, in the annexed table, denote the lights shown, and the shaded ones, thus ●, denote the lights obscured or eclipsed.

It is to be observed that, when one or two lights are to be obscured, the lights composing the signal are first shown for a few minutes; then one or two lights, as indicated in the table, to be obscured for twenty or thirty seconds, and which is to be repeated by showing the lights again until answered and understood by the ships to which the signal may be addressed.

A TABLE of the number of GUNS, LIGHTS, and BLUE LIGHTS, employed to express numbers, which refer to certain significations, as set forth in the following table.

Guns.	Blue-Lights.	Lights.	Numbers.	
1	—	—	0	One gun to call the attention of the fleet.
—	—	1	1	A general acknowledgment that the signal is understood.
—	—	2	2	Stand upon the starboard tack.
—	—	3	3	Stand upon the larboard tack.
—	—	4	4	Annul the foregoing signal.
—	1	—	5	To show my situation.
—	1	1	6	Heave to upon the starboard tack.
—	1	2	7	Heave to upon the larboard tack.
—	1	3	8	Make sail.
—	1	4	9	Shorten sail.
2	—	—	10	We are overpressed with sail.
2	—	1	11	Headmost ship shorten sail.
2	—	2	12	Request to speak the commodore.
2	—	3	13	Continue as before, although the commodore acts otherwise.
2	—	4	14	We have carried away a top-mast, or top-sail-yard.
2	—	1	15	We see danger.
2	1	1	16	A stranger is in the fleet.
2	1	2	17	Show no light.
2	1	3	18	Haul two points to starboard.
2	1	4	19	Haul two points to port.
3	—	—	20	North.
3	—	1	21	North-east.
3	—	2	22	East.
3	—	3	23	South-east.
3	—	4	24	South.
3	1	—	25	South-west.
3	1	1	26	West.
3	1	2	27	North-west.
3	1	3	28	
3	1	4	29	
4	—	—	30	

Explanation of the table.—Each lantern-light to four expresses 1, 2, 3, 4, respectively. One blue-light expresses 5. Two guns express 10, three guns express 20, and four guns 30. To express any number, therefore, as for instance 19, fire two guns, burn one blue-light, and hoist four vertical lights where they can best be seen.

Previous to making any of the first nine signals, which do not require guns to express the number, one gun will be fired to draw the attention of the fleet, and in making the remaining signals, the necessary guns will be fired to draw the attention of the fleet previous to hoisting the lights, or burning the blue-light. To prevent a confusion of lights, when a signal is made from the commodore, the top light will be covered.

It is recommended to use glass signal-lanterns, as horn admits a very dull light. Such lanterns should be well strengthened down the sides, and be provided with a secure ring at the bottom as well as at the top, for the convenience of bending them to each other; and to the top ring of three of the signal-lanterns a tack should be fitted, about a fathom long, to admit their being bent to each other with regularity and despatch.

SIGNAL, PREPARATORY (Fr. signal préparatoire), a signal given by the admiral to the whole, or any part of his fleet, and is immediately answered by those to whom it is directed; by showing the same signal, to testify that they are

ready to put his orders in execution. Having observed their answer, he will show the signal which is to direct their operations: as, to chase, to form the line, to begin the engagement, to board, to double upon the enemy, to rally or return to action, to discontinue the fight, to retreat and save themselves. The dexterity of working the ships in a fleet depends on the precise moment of executing these orders; and on the general harmony of their movements: a circumstance which evinces the utility of a signal of preparation.

As the extent of the line of battle, and the fire and smoke of the action, or other circumstances in navigation, will frequently prevent the admiral's signals from being seen throughout the fleet, they are always repeated by the officers next in command; by ships appointed to repeat signals; and, finally, by the ship or ships for which they are intended.

The ships that repeat the signals, besides the chiefs of squadrons or divisions, are usually frigates lying to windward or to leeward of the line. They should be extremely vigilant to observe and repeat the signals, whether they are to transmit the orders of the commander-in-chief, or his seconds, to any part of the fleet, or to report the fortunate or distressful situation of any part thereof. By this means all the ships from the van to the rear will, unless disabled, be ready

at a moment's warning, to put the admiral's designs in execution.

To preserve order in the repetition of signals, and to favor their communication, without embarrassment, from the commander-in-chief, to the ship for which they are calculated, the commanders of the squadrons repeat after the admiral; the chiefs of the divisions, according to their order in the line, after the commanders of the squadrons; and the particular ships after the chiefs of the divisions; and those in return, after the particular ships, and vice versa, when the object is to convey any intelligence from the latter to the admiral.

Signal of attack or assault, in the land service (Fr. signal d'une attaque, ou d'un assaut). This signal may be given in various ways: by the discharge of a lighted shell, by sky-rockets, by colors displayed from a conspicuous spot, &c. In 1747 marshal Lowendbal made use of lighted shells or bombs, when he laid siege to the town of Bergen-op-zoom. During the consternation of the inhabitants, which was excited by a continual discharge of these signal shells, the grenadiers entered a practicable breach, and took the town by storm.

Signals made by the colors of an army (Fr. signaux des enseignes).—The ancients had recourse to all the various methods which could be used by signals, to express the particular situation of affairs, and to indicate measures that should be adopted. If, during an engagement, victory seemed inclined more to one side than another, the colors belonging to the victorious party were instantly bent towards its yielding antagonist. This signal was conspicuous to the men, and excited them to fresh efforts. They imbibed the most lively hopes of success, and eagerly pressed forward to reap the advantages of bravery and good conduct. When an army was hard pressed by its enemy the colors of the former were raised high in air, and were kept in a perpetual flutter and agitation, for the purpose of conveying to the soldiers that the issue of the battle was still doubtful, and that nothing but courage and perseverance could determine the victory. If, in the heat of action, any particular regiment seemed to waver and give way, so as to cause an apprehension that it might finally be broken, its colors were instantly snatched out of the bearer's hands by the general or commanding officer, and thrown into the thickest of the enemy. It frequently happened that the men who were upon the point of yielding ground and flying received a fresh impulse from this act, rallied, and, by a desperate effort of courage, recovered the colors, and restored the day. This method of reanimating their legions was generally resorted to by the Romans. We have had instances in modern times in which the fortune of the day has been wholly decided by some sudden and unexpected act of an individual. In the reign of Louis XIV. a private soldier threw his hat into the midst of the enemy, during a hard fought and doubtful battle, expressing thereby that fresh succors were arrived to strengthen the French army. This circumstance, so apparently trifling, produced the desired effect. It threw the enemy into confusion, gave the French fresh spirits, and

finally determined the victory in their favor. We read of various instances in which signals have been used to express the personal danger of a king or general, who was fighting at the head of a select body of men. The knowledge of the critical position in which their leader stood, excited fresh courage in the rest of the troops, and drove them to acts of the greatest intrepidity. In the course of the late war some examples of the same sort might be adduced, both on the side of Austria and on that of France. The action on the bridge of Lodi, the passage of the Teglimenti, &c., would illustrate any observations we could make upon the subject.

Nor are the advantages which arise from the use of signals confined to these particular cases. Various circumstances grow out of the desultory nature of military operations to render flags of communication indispensably necessary. The vast scope which is given to modern tactics makes it impossible that the human eye or voice should take in all the critical manœuvres or evolutions that occur when an extended line is actually engaged. The right wing may be giving way, while the left is gaining ground, and the centre might be in danger, while the two flanks were rapidly advancing with apparent security against the enemy; as was the case in the battle of Marengo. Under these circumstances a general, by means of communicating signals, would be enabled to provide for every contingency without losing time by sending his orders verbally. Although signal flags, in modern engagements, have been generally laid aside, their use has been acknowledged in the adoption of warlike instruments, which, by the variety of their sounds, convey the necessary directions to an engaging army.

The ancients had signals which they called mute signals (*signaux muets*). These consisted in certain actions or signs that were made by a general; such as waving the hand, brandishing a stick or sword, or by exhibiting to view any part of his dress, accoutrements, &c. Instances of the same kind have occurred among the moderns. Under this denomination may likewise be classed the different signals made for the movement, marching, and manœuvring of troops, in and out of quarters. When troops are scattered, or separated from one another, it is usual to communicate by means of fires lighted upon eminences during the night, and by smoke during the day.

In former times large pieces of wood were hung above the towers of cities or castles, which, by being drawn up or lowered, gave intelligence of what passed. This method has been succeeded by the invention of telegraphs, which answer every purpose of communication, when they can be established through any extent of country. Besides those signals there are others which may be called vocal and demi-vocal. The vocal signals are those of the human voice, which consist in the necessary precautions that are adopted to prevent a guard or post from being surprised, to enounce words of command in action, &c. Of the first description are paroles and countersigns, which are exchanged between those to whom they are entrusted, and which are frequently altered, during the day and night, to prevent the enemy from receiving any information by means

of spies. The demi-vocal signals are conveyed by military instruments; the different soundings of which indicate, instantaneously, whether an army is to halt or to advance, whether troops are to continue in the pursuit of an enemy, or to retreat.

The demi-vocal signals, directed to be observed in the British service, as far as regards the manœuvring of corps, &c., consist of signals for the government of light infantry, and of cavalry regiments, squadrons, or troops: the latter are properly called soundings. Light infantry signals are to give notice—to advance; to retreat; to halt; to cease firing; to assemble; to call in all parties. In the regulations, printed by authority, it is observed that these signals are to be always considered as fixed and determined ones, and are never to be changed. The bugle horn of each company is to make himself perfect master of them. All signals are to be repeated; and all those signals which are made from the line or column are to convey the intention of the commanding officer of the line to the officer commanding the light infantry, who will communicate them to the several companies or detachments either by word or signal.

SIGNAL-FLAG, in ancient military history, was a gilded shield hung out of the admiral's galley; it was sometimes a red garment or banner. During the elevation of this signal the fight continued, and by its depression, or inclination towards the right or left, the rest of the ships were directed how to attack their enemies, or retreat from them.

SIGNAL-STAFF. In matters of military parade it is usual to fix a red flag, somewhat larger than a camp color, to point out the spot where the general, or officer commanding, takes his station in front of a line. This is called the signal-staff.

SIGNATURE, *n. s.* Fr. *signature*; Lat.

SIGNATURIST. *signatura*, *signo*. A sign or mark impressed; stamp; a mark; proof: signaturist, one who holds the old doctrine of signatures.

All bodies work by the communication of their nature, or by the impression and *signatures* of their motions: the diffusion of species visible seemeth to participate more of the former, and the species audible of the latter. *Bacon's Natural History.*

Seek out for plants and *signatures*,
To quack of universal cures. *Hudibras.*

The most despicable pieces of decayed nature are curiously wrought with eminent *signatures* of divine wisdom. *Glanville.*

Signaturists seldom omit what the ancients delivered, drawing unto inference received distinctions. *Browne.*

That natural and indelible *signature* of God, which human souls, in their first origin, are supposed to be stamp'd with, we have no need of in disputes against atheism. *Bentley.*

Vulgar parents cannot stamp their race
With *signatures* of such majestic grace. *Pope's Odyssey.*

The brain being well furnished with various traces, *signatures*, and images, will have a rich treasure always ready to be offered to the soul. *Watts.*

Herbs are described by marks and *signatures*, so far as to distinguish them from one another.

Baker on Learning

Some plants bear a very evident *signature* of their nature and use. *More against Atheism.*

Some rely on certain marks and *signatures* of their election, and others on their belonging to some particular church or sect. *Rogers.*

SIGNATURE, in printing, is a letter put at the bottom of the first page, at least, in each sheet, as a direction to the binder in folding, gathering, and collating them. The signatures consist of the capital letters of the alphabet (omitting J, V, and W), which change in every sheet; if there be more sheets than letters in the alphabet, to the capital letter is added a small one of the same sort, as A a, B b; which are repeated as often as necessary. In large volumes it is easy to distinguish the number of alphabets, after the first three or four, by placing a figure before the signature, as 5 B, 6 B, &c.

SIGNATURES are used, in a particular sense, to denote those external marks by which physiognomists and dabblers in the occult sciences pretend to discover the nature and internal qualities of every thing on which they are found. According to Lavater, every corporeal object is characterised by signatures peculiar to itself. The doctrine of signatures, like alchymy and astrology, was very prevalent during the fifteenth and sixteenth centuries; and was considered as one of the occult sciences which conferred no small degree of honor on their respective professors. Some of these philosophers, as they styled themselves, maintained that plants, minerals, and animals, but particularly plants, had signatures impressed on them by the hand of nature, indicating to the adept the therapeutic uses to which they might be applied. Others, such as the mystic theosophists and chymists of that day, proceeded much farther in absurdity, maintaining that every substance in nature had either external signatures immediately discernible, or internal signatures, which, when brought into view by fire or menstrua, denoted its connexion with some sidereal or celestial archetype. Of the doctrine of signatures, as it relates merely to the therapeutic uses of plants and minerals, traces are to be found in the works of some of the greatest authors of antiquity; but the celestial signatures were discovered only by the moonlight of the monkish ages.

SIGNATURE OF THE COURT OF ROME is a supplication answered by the pope, by which he grants a favor, dispensation, or collation to a benefice, by putting the fiat at the bottom of it, in his own hand; or the concessum est written in his presence. This signature, at the bottom of the supplication, gives name to the whole instrument.

The signature contains the clauses, derogations, and dispensations, with which the pope grants the favor, or the benefice, with a commission for the execution of it, either in forma dignum, or in gracious form.

A signature of the pope's own hand, by which he answers, fiat ut petitur, is preferred to another answered by the prefect, in his presence, in these words, Concessum uti petitur in presentia D. N. papæ. Sometimes in signatures with the fiat the pope adds, proprio motu; which clause gives them still farther force.

There are three kinds of signatures: one in forma grätiosa, despatched on an attestation of the ordinary; another in forma dignum antiqua, despatched for canonicates; the third in forma dignum novissima, which is a kind of second signature, or executorial letter, granted where, upon the ordinary's failing to execute the first, within thirty days, the nearest other ordinary is enjoined to execute it.

SIG'NET, *n. s.* Fr. *signette*. A seal commonly used for the seal manual of a king, or sovereign authority.

Give thy *signet*, bracelets, and staff.

Genesis xxxviii. 18.

He delivered him his private *signet*. *Knolles.*

I've been bold

To them to use your *signet* and your name.

Shakspeare. Timon.

Here is the hand and seal of the duke: you know the character, I doubt not, and the *signet*.

Id. Measure for Measure.

Proof of my life my royal *signet* made. *Dryden.*

The impression of a *signet* ring.

Ayliffe's Parergon.

The **SIG'NET** is one of the king's seals, made use of in sealing his private letters, and all grants that pass by bill signed under his majesty's hand: it is always in the custody of the secretaries of state.

SIG'NET, in Scottish law. See **LAW**.

SIGNIFICAVIT, a writ issuing out of the chancery, upon certificate given by the ordinary of a man's standing excommunicate by the space of forty days, for the laying him up in prison till he submit himself to the authority of the church: and it is so called because significavit is the emphatical word in the writ. *Reg. Orig.* There is also another writ of this name in the register, directed to the justices of the bench, commanding them to stay any suit depending between such and such parties, by reason of an excommunication alleged against the plaintiff, &c.—*Reg. Orig. 7.* And in Fitzherbert we find writs of significavit in other cases; as significavit pro corporis, deliberatione, &c.—*F. N. B. 62, 66.* The common writ of significavit is the same with the writ excommunicato capiendo.

SIGNIFY, *v. a. & v. n.* Fr. *signifier*; Lat.

SIGNIFICANCE, *n. s.*

SIGNIFICANCY,

SIGNIFICANT, *adj.*

SIGNIFICANTLY, *adv.*

express a meaning with force or emphasis: significance or significancy is power of signifying; meaning; weighty or important meaning; energy; consequence: the adjective and adverb corresponding.

He sent and *signified* it by his angel unto John.

Revelation i. 1.

Whereas it may be objected, that to add to religious duties such rites and ceremonies as are *significant*, is to institute new sacraments. *Hooker.*

Since you are tongue-tied, and so loth to speak, In dumb *significants* proclaim your thoughts.

Shakspeare. Henry VI.

Stephano, *signify*

Within the house your mistress is at hand.

Shakspeare.

Life's but a walking shadow; a poor player, That struts and frets his hour upon the stage,

And then is heard no more! It is a tale, Told by an ideot, full of sound and fury, *Signifying* nothing!

Id. Macbeth.

It was well said of Plotinus, that the stars were *significant*, but not efficient. *Raleigh.*

Neither in the degrees of kindred they were destitute of *significant* words; for whom we call grandfather, they called ealdfader; whom we call great-grandfather, they called thirdafader.

Camden's Remains.

If the words be but comely and *signifying*, and the sense gentle, there is juice; but where that wanteth, the language is thin. *Ben Jonson.*

The holy symbols or signs are not barely *significant*, but what by divine institution they represent and testify unto our souls is truly and certainly delivered unto us. *Brerewood.*

Here is a double *significatory* of the spirit, a word and a sign. *Taylor.*

Though he that sins frequently, and repents frequently, gives reason to believe his repentances before God *signify* nothing, yet that is nothing to us. *Id.*

He hath one way more, which, although it *signify* little to men of sober reason, yet unhappily hits the suspicious humour of men, that governors have a design to impose. *Tillotson.*

Speaking is a sensible expression of the notions of the mind, by discriminations of utterance of voice, used as signs, having by consent several determinate *significancies*. *Holder.*

Common life is full of this kind of *significant* expressions, by knocking, beckoning, frowning, and pointing; and dumb persons are sagacious in the use of them. *Id. on Speech.*

Brute animals make divers motions to have several *significations*, to call, warn, cherish, and threaten. *Holder.*
